- A dual tone shade with Random Sparkling dots and Gradient & Pearl effect
- LexisNexis brand name, logo, animated flying bird and 2D/3D Depth Background bearing 'ORIGINAL'
- An unique Alpha Numeric number (no two holograms have same serial number)

PREFACE TO SIXTH EDITION

Forensic Science in Criminal Investigation and Trials is an encyclopedic comprehensive guide, a practical multi-professional treatise, written in non-technical language. The sixth edition of this book is updated with recent changes in the area of forensic sciences. This edition covers new emerging fields and updates the content of the older ones.

As Forensic Science is highly diversified, there is no book which encompasses the entire field and that too in layman's language, especially from an experienced scientist. There is no book on Forensic Science which fits the bill and assists the non-specialist to acquire a working knowledge in Forensic Science to meet the challenges of scientific evidence. Books for the specialist are available in plenty. But there is none for the judge or the lawyer, nor for the investigator or for the public. These rapid changes have, therefore created a need for extensive revision of the book, which has been done.

The progress in science and technology, especially in the handling, processing, transfer of information and evaluation tools and techniques has been phenomenal in recent years. Though the subject is highly scientific and technical in nature, it has been tackled in such a way that any lay person cannot only follow it but can also enjoy it. The author, therefore, has ventured to produce scientific book(s) in non-scientific language.

It is true that the book often contains hard and dry facts, but numerous photographs, illustrations and case histories are interspersed in the text to make the subject somewhat lighter, more lucid and easily intelligible. It combines and presents the content relating to diagnostic skills of a physician, the dexterity in approach of a surgeon, the research skill of a forensic expert, and above all, the teaching skills of a professor to bring home a wide range of subjects relating to the concerned field of law. Case law is the lifeline of the court decisions. The Supreme Court's decisions (cases of 21st century given separately) have been included in this edition along with the summary. These decisions provide guidelines on various points of law and facts on scientific evidence which helps in understanding the concept in a better way.

The book is addressed to all those who are concerned with, and deal with forensic cases, administrators, investigators, experts, counsels, judges, forensic science students and even the public who face the crime abuse from time to time.

B.R. SHARMA

PREFACE TO FIFTH EDITION

The revision of this book has been long overdue. Numerous reprints, with or without supplements have been published since its last revision in 2003, but it had started looking outdated. Hence the present revised Avatar. The changes in all aspects of forensics have been so wide and expansive that the new additions (chapters in the present Edition increased from 21to 33!) in the new edition have made it almost a new book. It covers most (not all) of the new emerging fields and updates the contents of the older ones. Only those specialties have been left, for the next Edition, which are not being utilized extensively in this country currently. The progress in science and technology, especially in the handling, processing, transfer of information and evaluation tools and techniques has been phenomenal in recent years. Even a decade old devices, ideas and literature have become redundant in most of the spheres of activities including that of Forensic Science.

Major thrusts in Forensic Science, in recent years, have been in the following fields:

1. Computers, computer crimes, cyber crimes.
2. Automation in all aspects of Forensics work, especially in its tools and techniques.
3. DNA analysis has become the be all and the end of all personal and other identifications.
4. Cell Phone has become the tool of choice for committing crime and also the weapon of great unparalleled utility to know the contacts of the culprit and his movements during the commission of crime. In addition it provides a host of other useful information.
5. Video-conferencing has eliminated the need for personal court attendance of the Forensics experts.
6. Voice analysis is becoming indispensable in scams, kidnapping and a multitude of other crimes.
7. Lie Detection, Narco-analysis and Brain printing are revolutionizing the interrogation. They are eliminating the repugnant third degree methods.

And so on.....The list is inexhaustible.

As Forensic Science is highly diversified there is no book which encompasses the entire field and that also in layman's language especially from horses' mouth. There is no book on Forensic Science which foot the bill and assist the non-specialist to acquire working knowledge in Forensic Science to meet the challenges of scientific evidence! Books for the specialist are available in plenty. But there is none for the judge or the lawyer, nor for the investigator or for the public. The rapid changes have, therefore created a need for extensive revision of the book, which has been done. Though the material is technical in nature yet it has been tackled in such a way that any intelligent person, given the will, can not only follow it but can also enjoy it.

The users targeted for the book is the judge, the lawyer, the investigator, the students of Forensic Science and the public at large. All of them are, largely, non-technical. The author, therefore, has ventured to produce scientific book(s) in non-scientific language. Yet it includes all the information, which a non-technical user would need in the dissemination of justice and in understanding the subject.

The steep rise in the crimes: Frequent murders, brutal rapes, mind boggling scams: the Commonwealth Game Scam, the 2G Telecommunication Scam, the Adarsh Buildings Scam, the Army Land Grab Scam and the coming up staggering illegal Foreign Deposit Scams are just the trailers of the pictures of Crime which the crime syndicate are churning out day in and day out. They need the latest tools and techniques. The book proposes to give basic knowledge of all about it.

Case Law is the lifeline of the court decisions. The counsels often quote only those cases, which favour their versions up-to-date case laws, mostly Supreme Court decisions (Supreme Court Cases of 21st century given separately), have been given. They provide guidelines on various points of law and facts on scientific evidence.

Many a lawyer feels at his wits' end when he has to present the expert and his evidence, Worse still, when he is to determine his (expert's) bona fides or standing; the worst of all, when he has to dissect the expert's evidence to find lacunae and falsehoods in the evidence. The book takes care of all these hurdles and describes the modus operand! for their handling correctly and comprehensively.

It is true that the book often contains the hard and dry facts but numerous photographs, illustrations and case histories are interspersed in the text to make the subject somewhat lighter, more lucid and easily intelligible.

This book, I must admit, is a result of both research and spade work. But it is not written from an ivory tower. It is based mainly on decades of personal practical experience in processing clues at the scene, evaluating them in the laboratory, presenting the findings in the court and meeting the challenges of numerous prominent and heady lawyers and opposing experts while giving evidence in courts. Besides, I have no hesitation to state that I have utilized the experience of all those who were and are involved in Forensic Science and whose experience is available in books, journals, brochures, departmental manuals and circulars, in seminars and conferences and on Internet. The information so gathered has been hashed and thrashed with concerned specialists individually and severally in seminars and meetings, in classrooms and lecture halls, Thus, it bears the hammering and honing of hundreds of Forensics experts, of police investigators, of legal luminaries and of students of Forensic Science.

The book is an encyclopedic comprehensive guide, a practical multi- professional treatise, written in non-technical language, addressed to all those who are concerned with and deal with Forensic cases: administrators, Investigators, Experts, Counsels, Judges, Forensic Science students and even the public who face the crime abuse from time to time.

The book should be free of errors, has been my cherished endeavour. However, acts of omission and commission are bound to be there; my apologies for the deficiencies, I shall be obliged if I am made aware of them.

Suggestions for improvements will be thankfully received and personally acknowledged.

B.R. SHARMA

ACKNOWLEDGEMENT TO THE FIFTH EDITION

I gratefully acknowledge the advice, wguidance, help and blessings of all those numerous well-wishers who have made it possible to write this book on Handwriting Forensics. But for their visible or invisible contributions it would not have been possible to induct in so much latest, relevant and essential information on the subject to make this new Avatar in the field of Forensic Science unique and indispensable to all those who are concerned with Forensics.

I am particularly thankful to all those Forensic Experts, researchers and thinkers, past and present, who, by dint of their hard work had made Forensics indispensable in dissemination of real justice and brought a status to the Forensic community. They are too numerous to be individually named here. The list includes also those who are spending their precious time day in and day out to make Forensics acceptable, objective, reliable and convincing through better data base and striving to achieve automation.

My thanks are particularly due to the following:

1. Shri D.R. Sharma, my elder brother, who provided the needed encouragement and inspiration and more importantly his blessings, to carry out this onerous task.
2. Mr. Sudarshan Sharma for providing all sorts of help in the preparation of the manuscript, drawings, photographs, illustrations and charts and providing computer help in giving the final shape to the manuscript. I am particularly indebted to him for weeding out the Printer's Devil (and that of the author's) at the final proof reading stage.
3. The Forensic Scientist who contributed to bring up the book variously:
   - Dr. Arun Sharma, Dr. Meenakshi, HP State Forensic Science Laboratory, Himachal Pradesh for scrutinizing part of the manuscript and offering valuable suggestions.
   - Dr. R.S. Verma, Retd. Director, CFSL Chandigarh,
   - Dr. L.A. Kumar of FSL Madhuban
   - Dr. S.N. Tewari of Agra
   - Dr. S.K. Modi of NICFS, Delhi
   - Shri Rup Singh of CBI CFSL, New Delhi
4. Shrimati Veena Sharma, Mr. Anil Sharma, Mr. Aditya, Ms Pallavi, Mr. Ashmit, Mr. Abdij for support in various ways
5. Mrs. Anjula Khajuria and Sarvshri R.K. Sharma and Ashok Sharma. All senior advocates of the Himachal High Court Shimla. They have helped to provide the necessary inputs relating to chapters on 'Relevant Law' and 'Case law'.
6. I also thank those persons whose works I have utilized unhesitatingly to make the book more useful to its readers.
7. Most importantly, I thank my Editors. Producers and publishers who have to bear with me for the vagaries of my time scheduling, and for the excellent job they have been doing all along to make this book such an excellent production.

B.R. SHARMA

PREFACE TO THE FOURTH EDITION

The revision of the book to produce the IVth Edition has been in the melting pot for a considerable time. It was a gigantic task and daunting too. The explosive advances in science and technology were the main challenge to update the information and yet not to make it the scientific bug to cause scientific blues. The majority of the readers are non-scientists. They are the police officers, the lawyers, the judges. The general student of Forensic Science who wants to get an overall bird's eye view of this expanding and overspreading science would also not like to be bogged down by the complicated technical details. It has been my endeavour to avoid the same. I hope I have succeeded in the effort and the additions in the new Edition do not cross the Lakshman Rekha.

Tremendous changes in all aspects of scientific investigation of crimes have taken place in the past decade or so and are continuing at a rapid pace. These changing trends have been encapsuled in the new edition. They mainly relate to:

1. Current thinking on Forensic Science.
2. Changing patterns of Firearms and their misuse.
3. New tools and techniques in handling Disputed Documents.
4. Explosives and Explosion.
5. Narcotics and Psychotropic Drugs.
6. Fires, especially arson.
7. Alcohol especially drunken driver.
8. DNA profiling.

The new trends in handling crimes, which are gaining increasing momentum, have been added as new topics. They are:

1. Computers
2. Forensic Psychology
3. Voice Analysis
4. Microtraces

The utilisation of the expertise on the above topics is yet limited in India but we can no longer afford to remain illiterate on these topics. For example, computer has engulfed all aspects of human life. It is making rapid stride towards crimes both for its control and creation. We can ignore the computers only at the societal peril. Likewise Forensic Psychology has to play increasingly important role in handling criminals, especially those criminals who are the first timers or who are the chance criminals or those who are the victims of circumstances.

In addition, it has to play its rightful role in the dissemination of real justice without third degree methods and bringing some solace to the victims. Likewise, voice analysis is becoming indispensable. The existence of Osama Bin Laden has been confirmed only through voice analysis. The analysis would certainly help to identify the ransom criminal and his ilk.

The microtraces, as evidence, will, perhaps, be the most important evidence in the changing scenario of crime, crime scenes and the absence of traditional evidence of eyewitnesses, approvers and the like and the criminal modus operandi. In quite a few cases perhaps it will be the only evidence to tie the criminal with the crime.

The discussions have naturally to be brief in a book of this type. However, I hoped the concise contents do not affect the clarity.

I have no hesitation to admit that the book though mostly based upon personal experience, yet I have utilised all available information in the literature, on the internet or from the personal communications and discussions with colleagues, friends and students.

I have no illusion that I have eliminated all acts of the omission and commission but I do hope that they are few and far in between and they do not affect the authenticity and the utility of the information.

Lastly, I request all serious readers of this book to favour me, as in the past, by pointing out the acts of omission and commission, ambiguities, if any, and suggestions for further improvement of the book. All communications will be thankfully received and personally acknowledged.

B.R. SHARMA

INTRODUCTION TO THE THIRD EDITION

Dr. Sharma's book 'Forensic Science in Criminal Investigation and Trials' has become a classic. It has undergone three Editions and four issues. Thousands of copies of the works have been sold throughout the country and abroad. They form part of the libraries of all the top lawyers, the ace investigating officers and the learned Judges. It has become indispensable to all those who are involved directly or indirectly in the dissemination of justice.

Many persons are surprised to find that Dr. Sharma's 'Forensic Science', as it is popularly known, is the only book on the subject in India. The reason for the same is not far to seek. Forensic Science is a multi-disciplinary science, involving all pure and applied sciences. In addition, it has developed its own branches over the years, such as, Forensic Ballistics, Serology, Dactyloscopy, Document evaluations, etc. It is also a multi-professional science and involves the police officer, the lawyer, the judge and, of course, the Forensic Scientist. It is not everybody's cup of tea to know, to understand and to interpret the tenets of this multi-disciplinary and multi-professional science to the specialist and the non-specialist alike. It is only a person like Dr. Sharma who started his career as director of a single-man's laboratory and progressively handled, expounded, researched in all branches of the science not within the confines of a laboratory walls only but also at the scene, in the court-rooms as well as in the class rooms of Police Training Colleges, Universities and other institutions of higher learning. The vast experience thus gained, for over three decades, has made it possible for him to encapsule the basic knowledge of the entire field in less than 900 pages. It covers all aspects: investigative, scientific, legal, simultaneously, exposing its potentialities and limitations in a lucid and illustrative manner.

Dr. Sharma, now, heads our State Forensic Science Laboratory. This Edition has come up here, with added dimensions. Two more parts, one on elementary 'Forensic Medicine' and the second, on the latest revolutionary development 'DNA Profiling' have increased the utility of the book immensely. I am sure the book will find place on the shelves and study tables of all the seasoned as well as the upcoming lawyers, the judges and the police officers, the Forensic Scientists and other students of Forensic Science.

I am happy to introduce this Magnum Opus to the readers. May the works help in the dissemination of real justice.

Holly Lodge,
Shimla-1, H.P.

(VIRBHADRA SINGH)
Chief Minister, H.P.

FOREWORD TO THE THIRD EDITION

Dr. B.R. Sharma's book on Forensic Science is probably the first book of its kind to be published in India though there have been many books on Forensic Science published in Europe and America. Hence Dr. Sharma's book should get wide circulation not only in all institutions dealing with Forensic Science but should be a text-book for all Police Officers and Magistrates and should form a valuable guide for the judiciary and the legal profession.

Dr. Sharma has divided his book in various parts and each part is complete by itself and could form a separate text-book. He has written it not only from his theoretical knowledge of the subject which is adequate but also from his own personal experience of running an important Forensic Science Laboratory of which he is the head. He has quoted many case histories which make the book still more readable and useful.

I have found this book of absorbing interest and I am sure that everyone connected with Forensic Science in any way would find it extremely useful.

Sd/-
(B.N. Mullik)
President, Indian Academy of
Forensic Sciences.

PREFACE TO THE FIRST EDITION

The lack of understanding and critical appraisal of specialists in general, by non-specialists, is all-pervasive. The field of Forensic Science is no exception. Neither the police, nor the lawyer, nor even the judge appreciates fully the advances or the extensive potentialities of the science. However for success, besides laborious laboratory work, it is necessary that the police correctly collects the correct clues, the counsel links the clues with the accused and the judge utilizes the expertise. If they fail to do so, the whole edifice built on science crumbles down. And it does happen in the courts frequently.

The reason for the debacle is not far to seek. The multi-discipline and multi-professional nature of forensic science needs an inter-professional approach. No such approach has been made. There is no book on the subject which provides a meeting ground for the professions involved—where the police officer can understand not only his own work but he also understands the requirements of the scientist, the lawyer and the judge and vice versa. Books have been written on the subject by authors belonging to all involved professions. Some of the books are excellent; but they are useful to the members of the professions of the authors only. They can hardly be read by members of the other professions. The intra-professional barriers have remained uncrossed.

In the present work, a serious attempt has been made to eliminate personal and professional bias and to delineate objectively the fundamentals and the parts and duties of the involved professions in a non-technical language. It is believed that the text can be understood even by a non-science student. It is hoped that the format chosen is sufficient to provide basic understanding of the science to the persons concerned and to enable them to carry out their functions more efficiently.

The various chapters of the book cover one important topic each. They are divided into sub-topics: importance, nature, problems, location, collection, evaluation, legal aspects, presentation, case law and bibliography. Thus the main needs of the various professions are covered in these sub-topics.

A book involving many disciplines and many professions necessarily has its limitations. I seek, on the score, the indulgence of the readers. May I request them to point out the same to me (or to the publishers)? All suggestions for the improvement of the book will be thankfully received and personally acknowledged.

B.R. SHARMA

ACKNOWLEDGEMENT TO THE FIRST EDITION

I am thankful to all who have helped me by way of guidance, advice, furnishing useful material and literature and encouragement, which has made it possible to revise this book extensively to create almost a new book. I am particularly thankful to:

1. Shri D.R. Sharma and Mrs. Nathi Sharma, who provided the necessary encouragement and blessings, to carry out the work.
2. The Forensic Scientists: Dr. R.S. Verma, Director C.F.S.L., Chandigarh, Dr. S.K. Jain, Mr. Geroti, Dr. Sukhbinder Kaur, Dr. J.K. Sinha, Dr. S.N. Sharma (all of Chandigarh), Dr. L.A. Kumar (Madhuban, Haryana), Dr. Arun Sharma (Shimla), Dr. J.R. Gaur (Shimla), Dr. S.N. Tewari (Agra), Dr. M.S. Rao (Chief Forensic Scientist, New Delhi), Dr. C.N. Bhattacharya (Hyderabad), Dr. B.N. Mattoo (Mumbai), Dr. J.K. Modi (NICFS, Delhi), Shri Rup Singh (Formerly of CBI), Dr. Peush Kapila (IGMC, Shimla), Dr. (Prof.) Dalbir Singh (PGIMRE, Chandigarh).
3. Computer specialists: M/s Anil Sharma, Aditya Sharma, Devika, Vina Sharma and Sudarshan Sharma for setting most of the book on computer, for improving the manuscript, preparing drawings and photographs, charts, illustrations, correcting the manuscript and thus making this revised version of the book possible.
4. Shri R.L. Sharma, R.K. Sharma, Ashok Sharma, Mrs. Anjula Khajuria who provided the necessary input vis-a-vis the legal aspects including the sprawling Case Law, which give the necessary output in the ultimate analysis of the expert evidence.
5. My wife, Smt. Ishri Devi, who has to suffer from my labours.
6. My Publishers who have been very patient with my procrastinations.
7. The editors and producers of my publishers who have taken so much pains to make the book such an excellent production.

CHAPTER 2
CRIME, CRIMINAL & CRIMINAL INVESTIGATION

2.1 CRIME **67**
2.1.1 Classification of Crime 68
2.1.2 Causes of Crime 70
2.1.3 Is it crime? 71
2.2 CRIMINAL **71**
2.2.1 Who is a Criminal? 71
2.2.2 Identity of a Criminal 72
2.2.3 Classification of Criminals 73
2.3 CRIMINAL INVESTIGATION **75**
2.3.1 Laws and Rules 75
2.3.2 Investigations 76
2.3.3 The Investigator 77
2.3.4 The Crime Scene 79
2.3.5 People Involved 79
2.4 CRIMINAL JUSTICE SYSTEM **81**
2.4.1 The Legislature 81
2.4.2 The Investigation Agencies 81
2.4.3 The Prosecution Agencies 81
2.4.4 Defence 82
2.4.5 Court 82
2.4.6 Prisons, Reformatories 83
2.4.7 Media 83
2.5 SUPREME COURT CASES — 21ST CENTURY **84**
2.5.1 Conviction for murder on Circumstantial Evidence alone 84
2.5.2 Relevant Extracts (Verbatim) 84
2.5.3 Dereliction in Investigation 87
2.5.4 Relevant Extract (Verbatim) 88
2.5.5 Duties of the Court 91
2.6 ADDITIONAL CASE LAW **93**
2.6.1 Judicial Misuse of "beyond reasonable doubt" 93
2.6.2 Relevant Extracts (Verbatim) 93
2.6.3 Scientific Criminal Investigation 94
2.6.4 Relevant Extracts (Verbatim) 94
2.6.5 Broken Custody Chain; Recovery Doubtful 96
2.6.6 Good Evidence 98
2.6.7 Eyewitness Accounts v Medico-Legal Expert Evidence 99
2.6.8 *Corpus Delicti* 101

2.6.9 Corroboration 102
2.6.10 Third Degree Methods 104
2.6.11 Police Padding 105
2.6.12 Stock Witness 106
2.6.13 Voluntary Confession 107
2.6.14 Trustworthiness of Police 109
2.6.15 Immediate Dispatch 110
2.6.16 Identification Marks 110
2.6.17 Chain of Custody 111
2.6.18 Delay in Dispatch 111
2.6.19 Seals on parcels intact 112

CHAPTER 3
FORENSIC SCIENCE IN TRIALS

3.1 TRIALS 114
3.2 EVIDENCE 115
3.2.1 Eyewitness Accounts 116
3.2.2 Scientific Alternative 116
3.3 PROBLEMS OF PROOF IN TRIALS 117
3.3.1 Investigative Problems 117
3.3.2 The clue material is relevant 119
3.3.3 It is authentic 119
3.3.4 Its integrity is beyond doubt 119
3.3.5 Its chain of possession is intact 119
3.3.6 Scientific Problems 119
3.3.6.1 Perfect Science 119
3.3.6.2 Substantive or Weak Science 120
3.3.6.3 Presentation of Evidence 121
3.3.6.4 Quality Control 121
3.3.6.5 Standardisation 121
3.3.6.6 Accreditation 122
3.3.6.7 Miscellaneous 122
3.3.7 Legal Hurdles 123
3.3.8 The number of matching points 123
3.3.9 Rudimentary Science 123
3.3.10 Identification of Handwriting 124
3.4 EXPERT TESTIMONY 124
3.5 THE EXPERT 126
3.6 FORENSIC REPORTS IN TRIALS 128
3.6.1 Contents of Report 128
3.6.2 Illustrations 131
3.6.3 Language 131
3.7 THE PROSECUTION COUNSEL 132
3.7.1 Role 132
3.7.2 Establish the *bona fide* of the Expert 132

3.7.3 Understand the Evidence 132
3.7.4 Induct Demonstrative Testimony Systematically 133
3.7.5 Anticipates the Defence Line 133
3.7.6 Handle Inconclusive Report Effectively 133
3.7.7 Listen to the Cross-examination Attentively 133
3.7.8 Re-examine the expert 133
3.8 DEFENCE COUNSEL 133
3.8.1 Role 133
3.8.2 Defence Counsel's Checklist 136
3.8.3 Did the expert compare the crime exhibits with the test ones? 136
3.8.4 Does the expert identify the exhibits? 136
3.8.5 Has the expert based his opinion on the accepted standards? 136
3.8.6 Is the evidence produced by the expert convincing? 137
3.8.7 Has the expert carried out adequate tests and experiments? 137
3.8.8 Are the exhibits authentic? 137
3.8.9 Is the expert biased? 138
3.8.10 Additional Details 138
3.9 THE JUDGE 138
3.10 FALLACIES ABOUT EXPERT EVIDENCE COURTS CONVENTIONS 140
3.10.1 "A Court Must Form its Own Opinion"— 140
3.10.2 "The Expert must answer in "Yes" or "No"" 141
3.10.3 "The Expert must answer all Questions" 141
3.10.4 "Expert Testimony is Weak Evidence" 141
3.10.5 "Expert Usurps Court's Functions" 141
3.10.6 "Experts Differ" 141
3.11 TIME ELEMENT 141
3.12 CASE LAW 142
3.12.1 "Rarest or Rare Case" 143
3.12.2 Court No Super Expert 146
3.12.3 Expert Evidence 147
3.12.4 Books as Authorities 149
3.12.5 Report under section 293 Cr PC Admissible 150
3.12.6 "Rarest or Rare Case" 152
3.12.7 Court No Super Expert 155
3.12.8 Benefit of Doubt 156
3.12.9 Expert v Ocular Evidence 158
3.13 ADDITIONAL CASE LAW 160
3.13.1 Expert Evidence 160
3.13.2 Court Appearance 161
3.13.3 Data necessary 161
3.13.4 Test Cartridge not produced 161
3.13.5 Data/evidence about Sanity/Insanity Essential 162
3.13.6 Admissibility of Opinion on Data 162
3.13.7 Language of Expert 162
3.13.8 Expert's Language 162
3.13.9 Expert Reports 162

3.13.10 Reports Admissible 163
3.13.11 Insufficient Evidence 166
3.13.12 No Identification marks 166
3.13.13 Prosecution Failure 166
3.13.14 Nature of weapon Uncertain 166
3.13.15 Prosecution Failure 167
3.13.16 Counter-complaints 167
3.13.17 Duties of the Defence 167
3.13.18 Failure of The Defence 167

3.13.21 Strictures 170
3.13.22 Fair Criticism of Courts 171

CHAPTER 4
SCENE OF OCCURRENCE

4.1 IMPORTANCE (GENERAL) 174
4.2 THE PROBLEMS/POSSIBILITIES 175
4.3 LOCATION 176
4.4 EVALUATION 176
4.4.1 Protection 176
4.4.2 Photography 178
4.4.2.1 Camera 179
4.4.2.2 Coverage 180
4.4.2.3 Photographic Exhibits 184
4.4.3 Recent Advances in Imaging/ Photography of the Scene 185
4.4.3.1 Aerial photography 185
4.4.3.2 Colour photography 185
4.4.3.3 Video filming 185
4.4.3.4 The use of markers 186
4.4.3.5 Photogrammetry 186
4.4.4 Sketching 186
4.4.5 Coordinate method 187
4.4.6 Polar Technique 188
4.4.7 Electronic Graphics 189
4.4.8 Height Determination 189
4.4.9 Search 190
4.4.10 Zonal Method 190
4.4.11 Spiral Method 191
4.4.12 Strip Method 191
4.4.13 Cross-hatch Search Method 192
4.4.14 Equipment 193
4.4.15 Handling Clues 193
4.4.16 Recording 195

4.5 MODERN AIDS **195**
4.5.1 Investigator's Kit 195
4.5.2 Examination kit 195
4.5.3 Making and breaking kit 195
4.5.4 Fingerprint kit 196
4.5.5 Casting kit 196
4.5.6 Blood testing kit 196
4.5.7 Collection paraphernalia 196
4.5.8 Recording equipments 196
4.5.9 Mobile Laboratory 196
4.5.9.1 Need 196
4.5.9.2 Paraphernalia 197
4.5.9.3 An MUV or SUV vehicle, with four-wheel drive 197
4.5.9.4 Investigator's kit 197
4.5.9.5 Photographic equipment 197
4.5.10 Portable Ultraviolet lamp/Infrared lamps/Small portable X-ray unit. 197
4.5.10.1 Miscellaneous 197
4.5.11 Flying Squads 198
4.6 EXPERT HELP **198**
4.7 DOCUMENTATION OF CRIME SCENE **202**
4.7.1 Worksheet 202
4.7.2 Scene Description 203
4.7.3 Photographic Documentation 205
4.7.4 Sketch Documentation 206
4.7.5 Evidence Recovery Log 206
4.7.6 Laboratory Submission Letter Format has 206
4.7.7 Chain of Possession Log 207
4.7.8 Broken Chain of Possession 207
4.8 ADDITIONAL READING **209**
4.9 CASE LAW **209**
4.9.1 Tracker Dog Evidence not proved Scientific 209
4.9.2 Relevant Extracts (Verbatim) 209
4.9.3 Identification of accused by sniffer dog 211
4.9.4 Relevant Extracts (Verbatim) 211
4.10 ADDITIONAL CASE LAW **212**
4.10.1 Police Dogs Identification 212
4.10.2 Location of the Scene 214
4.10.3 No Blood at the alleged Scene (Fake Scene) 214
4.10.4 Preservation and Guarding of the Scene 215
4.10.5 Identity of the Scene 215
4.10.6 Manipulation of the Scene 216
4.10.7 Clues: Location, Collection, Chain of Custody 217
4.10.8 Police Dogs Identification 217
4.10.9 Tracker Dog's Lacunae 219
4.10.10 Utility of Tracker Dogs 220
4.10.11 Tracker Dog Evidence Alone Insufficient 221

4.10.12 Tracker Dog work not proved Scientifically 222
4.10.13 Detective Dyes – Trap Evidence 224
4.10.14 Anthracene as Detective Dye 224
4.10.15 Preservation of Phenolphthalein Solution 225
4.10.16 Phenolphthalein as Detective Dye 226

CHAPTER 5
FINGERPRINTS

5.1 IMPORTANCE 230
5.1.1 Unique 231
5.1.2 Permanent 231
5.1.3 Universal 231

5.10 PRESENTATION 252
5.11 LEGAL ASPECTS 253
5.11.1 Specimens and the Constitution 253
5.11.2 Authorities 253
5.11.3 Fingerprint Experts 253
5.11.4 Fingerprints Reports 254
5.12 MISCELLANEOUS 254
5.12.1 Palm and Sole Prints 254
5.12.2 Poroscopy 254
5.12.3 Body Prints 254
5.12.4 Fingerprints of Twins 255
5.12.5 Transmission 255
5.12.6 Advances in Collection of Fingerprints 255
5.12.7 New Evaluation Technology 255
5.13 CASE LAW 255
5.13.1 Absence of Fingerprint Evidence not Fatal 256
5.13.2 Court No Fingerprint Expert 256
5.13.3 Fingerprint identifies the barbaric Murderer 259
5.13.4 Non-exhibited Report Inadmissible 262
5.13.5 Taking of fingerprints without obtaining the order of Magistrate 264
5.14 ADDITIONAL CASE LAW 266
5.14.1 Expert Necessary 266
5.14.2 Fingerprint Evidence 266
5.14.3 Blood-stained Fingerprint 269
5.14.4 Sufficient Evidence 269
5.14.5 Proper Processing: No Lacunae 271
5.14.6 Improper Presentation 272
5.14.7 Uncorroborated Evidence 273
5.14.8 Fingerprints provide Definite Link 274
5.14.9 The Court's Scrutiny 277
5.14.10 Fingerprint Reports 278
5.14.11 Identification Basis of Fingerprints 278
5.14.12 Fingerprint Recovery Doubtful 281
5.14.13 Fingerprint Evidence Rejected 283
5.14.14 Judge not to Act as Fingerprint Expert 286

CHAPTER 6
TRACK MARKS

6.1 GENERAL **290**
6.1.1 Utility 291
6.1.2 Misconceptions about Track Evidence 291
6.2 NATURE **292**
6.2.1 Naked Footmarks 293
6.2.2 Footwear Marks 293
6.2.3 Gait Pattern 294
6.2.4 Footwear 295
6.2.5 Extraneous Matter 297
6.3 PROBLEMS/POSSIBILITIES **297**
6.4 LOCATION **298**
6.4.1 The Scene 298
6.4.2 The Routes 299
6.4.3 Conference Site 299
6.4.4 Parking Place 299
6.5 COLLECTION **299**
6.5.1 Materials Required 300
6.5.2 Collection Techniques 300
6.5.3 Photography 300
6.5.4 Lifting 301
6.5.5 Casts 302
6.5.6 Impression in Mud 303
6.5.7 Impressions in Snow 304
6.5.8 Specimens 304
6.6 INNOVATIVE TECHNIQUES **304**
6.6.1 Holography 304
6.6.2 Electrostatic Technique 305
6.6.3 Periphography 306
6.6.4 Latent Prints Processing 306
6.6.5 Silicone Casts 307
6.7 EVALUATION **307**
6.7.1 Naked Footmarks 308
6.7.2 Footwear Marks 311
6.7.3 Hoof Marks 314
6.7.4 Paw Marks 314
6.7.5 Tyre Marks 314
6.7.6 Gait Pattern 314
6.8 IDENTIFICATION TECHNIQUES **315**
6.8.1 Measurements 315
6.8.2 Side by Side Comparison 315
6.8.3 Photographic Superimposition 315
6.8.4 Adhesive Tape Superimposition 316
6.8.5 Composite Match 316
6.8.6 Pressure Pattern Evaluation 316
6.8.7 Skid Marks 316

6.9 PRESENTATION **317**
6.10 ACCEPTABILITY **317**
6.10.1 Law and the Science 317
6.10.2 Law and the Specimens 317
6.10.3 Recognition of the Expertise 317
6.11 ADDITIONAL READING **322**
6.12 CASE LAW **322**
6.12.1 Footprint evidence Admissible 322
6.12.2 Non-acceptability of Evidence 322
6.12.3 Expert Testimony Value 324
6.12.4 Admissibility 324
6.12.5 Track mark Identification Admissible 325
6.12.6 Footwear Evidence — Police Padding 327
6.12.7 Track Evidence as a Circumstance 328
6.12.8 Improper Testimony 330
6.12.9 Probable Evidence 331
6.12.10 Footprint Evidence — No Data 334

CHAPTER 7
TOOL MARKS

7.1 NATURE **337**
7.1.1 Definition 337
7.1.2 Types of tool Marks 337
7.1.3 Classification 338
7.1.3.1 Sliding or dynamic marks 338
7.1.3.2 Cut Marks 338
7.1.3.3 Impact/Static marks 338
7.1.3.4 Repetitive Action marks 339
7.1.3.5 Indentations/Impact Marks 339
7.1.3.6 Scrapes/Sliding Marks 340
7.1.3.7 Saw Marks 340
7.1.3.8 Drill Marks/Holes 340
7.1.3.9 Punch Marks 341
7.1.3.10 Dies 342
7.1.3.11 Engraved Marks 342
7.1.3.12 Prints 342
7.1.3.13 Painted Marks 342
7.1.3.14 Broken or Severed Parts 343
7.1.3.15 Contact Marks 345
7.1.3.16 Extraneous Material 346
7.2 IMPORTANCE **346**
7.2.1 Frequency 347
7.2.2 Permanency 347
7.2.3 Individuality 347
7.2.4 Linkage 347
7.2.5 Reconstruction 347

7.3 LOCATION **348**
7.4 COLLECTION **349**
7.4.1 Articles 349
7.4.2 Casts 349
7.4.2.1 Plasticine 349
7.4.2.2 Dental Mass 349
7.4.2.3 Adhesive Tape 349
7.4.2.4 Latex and Plastic Solutions 349
7.4.2.5 Wood's Metal 350
7.4.2.6 Plaster of Paris 350
7.4.2.7 Tracing 350
7.4.2.8 Cellulose acetate casts 350
7.4.2.9 Silicone casts 350
7.4.3 Packing 351
7.4.4 Standards 351
7.4.5 Extraneous Materials 351
7.4.5.1 Incriminating Traces 352
7.4.5.2 Standards Sample Traces 352
7.5 EVALUATION **352**
7.5.1 Principle 352
7.5.2 Techniques 353
7.5.2.1 Mechanical Fit 353
7.5.2.2 Side by Side Match 354
7.5.2.3 Composite Match 354
7.5.2.4 Juxtapositioning Striations 355
7.5.2.5 Composite comparison of striations 356
7.5.2.6 Stratigraphy 356
7.5.2.7 Superimposition 356
7.5.3 Sufficient Evidence 356
7.6 CASE LAW **359**
7.6.1 Button Evidence 359
7.6.2 Mechanical Fit 360
7.6.3 Weapon used in commission of crime 360

CHAPTER 8
FIREARMS FORENSICS

8.1 IMPORTANCE **364**
8.2 NATURE **365**
8.2.1 Firearms 365
8.2.2 Firearm Parts 366
8.2.2.1 Barrel 366
8.2.2.2 Action 367

NARCOTICS

12.1 INTRODUCTION 870
12.1.1 Medical Definitions of narcotics 870
12.1.2 Legal Definitions 870
12.1.3 Deterrents 872
12.2 ADDICTION 874
12.2.1 Nature 874
12.2.2 Signs/Symptoms of Addiction 874
12.2.3 Causes of Drug Addiction 875
12.3 THE ADDICT 875
12.3.1 Identification of the Addict 876
12.3.2 Withdrawal Syndrome 877
12.3.2.1 Stage I (8–24 hours) 878
12.4 NARCOTICS AND CRIMES 878
12.4.1 Non-violent Crimes 878
12.4.2 Violent Crimes 879
12.4.3 Drug Problem in India 879
12.5 COMMON NARCOTICS 879
12.6 CLASSIFICATION 880
12.6.1 Sedatives 881
12.6.2 Effects 881
12.6.3 Drug Dependence 881
12.6.4 Non-Opiate Opioids 881
12.6.5 Miscellaneous 882
12.6.6 Stimulants 882
12.6.7 Hallucinogens 882
12.6.8 Solvents 883
12.6.9 Synthetic Narcotics 883
12.6.10 Designer Drugs 883
12.7 EVIDENTIARY CLUES 884
12.7.1 Drug Addict 884
12.7.2 Addict's Residence 885
12.7.3 Clandestine Laboratories 885
12.7.4 Drug Distributor/Peddler 885
12.7.5 Drug Joints 886
12.7.6 Collection of Evidentiary clues 886
12.8 DRUG PROBLEMS/POSSIBILITIES 886
12.9 SEDATIVES 887
12.9.1 Opium and Opium Derivatives 887
12.9.2 Opium 889
12.9.3 Morphine 890
12.9.3.1 Administration 890
12.9.3.2 Physiological Effects 890
12.9.3.3 Metabolism 890

12.9.3.4 Addiction 890
12.9.3.5 Identification 890
12.9.4 Heroin 892
12.9.4.1 Abuse 892
12.9.4.2 Physiological Effects 892
12.9.4.3 Identification 893
12.9.5 Barbiturates 895
12.9.5.1 Nature 895
12.9.5.2 Administration 896
12.9.5.3 Fatal Dose 896
12.9.5.4 Addiction 896
12.9.5.5 Metabolism 896
12.9.5.6 Identification 896
12.9.6 Other Non-opiate Sedatives 897
12.10 STIMULANTS 897
12.10.1 Cocaine 897
12.10.1.1 Origin 897
12.10.1.2 Use 897
12.10.1.3 Abuse as Narcotic 897
12.10.1.4 Administration/Intake 898
12.10.1.5 Effects of Cocaine 898
12.10.1.6 Physiological Effects 898
12.10.1.7 Addiction 899
12.10.1.8 Metabolism 899
12.10.1.9 Identification 899
12.10.2 Amphetamines 901
12.10.2.1 Administration 901
12.10.2.2 Effects 901
12.10.2.3 Addiction 901
12.10.2.4 Metabolism 902
12.10.2.5 Identification 902
12.11 HALLUCINOGENS 902
12.11.1 Cannabis (Bhang) 903
12.11.1.1 Administration 904
12.11.1.2 Effects 904
12.11.1.3 Addiction 905
12.11.1.4 Metabolism 905
12.11.1.5 Identification 905
12.11.2 LSD (Lysergic Acid Diethylamide) 906
12.11.2.1 Administration 906
12.11.2.2 Effects 907
12.11.2.3 Addiction 907
12.11.2.4 Metabolism 907
12.11.2.5 Identification 907
12.12 RECENT TRENDS 907

12.13 CASE LAW **912**
12.13.1 Contraband Quantity in Mixtures 912
12.13.2 Commercial or Small Quantity of Contraband 918
12.13.3 Identified Opium: morphine content Immaterial 920
12.13.4 Personal Search 922
12.14 ADDITIONAL CASE LAW **924**
12.14.1 Bhang not a Narcotic under NDPS Act 924
12.14.2 Cannabis is contraband 926

CHAPTER 13
ALCOHOL

13.1 GENERAL **929**
13.2 NATURE **932**
13.2.1 Classification 932
13.2.2 Properties 932
13.2.3 Production 933

16.1.1 Crimes and Vehicles 1076
16.2 NATURE 1077
16.2.1 Types of Accidents 1079

16.2.2 Causes of Road Accidents 1080
16.2.2.1 The Driver 1080
16.2.2.2 The Vehicle 1080
16.2.2.3 The Road 1080
16.2.2.4 The Victim 1081
16.2.3 Theft of Automobiles 1082
16.3 THE PROBLEMS/POSSIBILITIES 1083
16.3.1 Tyre Marks 1084
16.3.2 Vehicle 1084
16.4 EVIDENTIARY CLUES 1085
16.4.1 The Vehicle(s) 1085
16.4.2 The Scene 1086
16.4.3 The Culprit/Victim 1086
16.5 COLLECTION 1087
16.6 EVALUATION 1089
16.6.1 Tyre 1089
16.6.2 Tyre Marks 1089
16.6.2.1 Tyre Width 1090
16.6.2.2 Tyre Circumference 1090
16.6.2.3 Tread Pattern 1090
16.6.2.4 Wear and Tear 1090
16.6.2.5 Adventitious Peculiarities 1091
16.6.2.6 Crab-track Vehicle 1092
16.6.2.7 Wheelbase Difference 1092
16.6.2.8 Turning Arc 1092
16.6.2.9 Side Prints of the Tyres 1092
16.6.2.10 The Position of the Tyres Inter se 1092
16.6.3 Skid Marks 1093
16.6.3.1 Speed Determination 1095
16.6.3.2 Calculations 1096
16.6.4 Tyre Residues 1099
16.6.5 Tyre Bursts 1100
16.6.6 Mechanical Failure 1100
16.6.7 Leftover Objects 1102
16.7 RESUSCITATION OF VEHICLE NUMBERS 1102
16.8 VEHICLE THEFTS 1104
16.8.1 General 1105
16.8.1.1 Joyride 1105
16.8.1.2 Escape 1105
16.8.1.3 Commission of Crime 1105
16.8.1.4 Economic Gains 1105
16.8.1.5 False Theft Reports 1106
16.8.2 Vehicle Theft Prevention 1106
16.8.2.1 Owner's role 1106
16.8.2.2 Police Role 1107
16.8.3 Possibilities 1109
16.8.3.1 Is the seized vehicle stolen? 1109
16.8.3.2 Who was its original owner? 1109

16.8.3.3 What is the make and model of the given vehicle? 1109
16.8.3.4 Was the stolen vehicle used in the commission of the crime in hand? 1109
16.8.3.5 Is the suspect linked with the theft of the vehicle? 1109
16.8.3.6 Was the alleged crime committed in the suspect vehicle? 1110
16.8.3.7 Has the given part come from the suspect vehicle? 1110
16.8.3.8 Is the driver driving the stolen vehicle? 1110
16.9 CASE LAW 1110
16.9.1 Victim's Fault 1110
16.9.2 Mischief 1111
16.9.3 Accident Evaluation 1114

CHAPTER 25
COMPUTERS

25.1 IMPORTANCE **1423**
25.1.1 Police Work 1423
25.1.2 Forensic Science 1424
25.1.2.1 Crime scene 1424
25.1.2.2 Fingerprints 1424
25.1.2.3 Tracks and Trails 1424
25.1.2.4 Forensic Ballistics 1424
25.1.2.5 Disputed Documents 1425
25.1.2.6 Chemical Analysis 1425
25.1.2.7 Biological Analysis 1426
25.1.2.8 Medico-Legal Work 1427
25.1.2.9 Medico-legal Research 1428
25.2 COMPUTERS AND LAW **1428**
25.3 NATURE **1429**
25.3.1 CPU 1429
25.3.2 Motherboard 1429
25.3.3 Hard disk 1429
25.3.4 Random Access Memory (RAM) 1429
25.3.5 Input Devices 1430
25.3.6 Output Devices 1430
25.4 COMPUTER WORK **1430**

CHAPTER 26
COMPUTER FORENSICS (COMPUTER/CYBER CRIMES)

26.1 GENERAL **1432**
26.1.1 Definition 1432
26.1.2 Computer crimes 1433
26.1.3 Computer and crime 1433
26.1.4 Computer Crimes: Motives 1434
26.1.5 Cyber crimes 1435
26.1.6 Characteristics 1435
26.1.6.1 Intangible Evidence 1435
26.1.6.2 Substantial Losses 1435
26.1.6.3 Prevalent Climate 1436
26.1.7 Investigative Impediment 1437
26.1.7.1 Hi-tech Crime 1437
26.1.7.2 International Crime Global Ramification 1437
26.1.7.3 No-Scene Crime 1437
26.1.7.4 Faceless Crime 1437
26.1.7.5 All/No-time Crime 1437

26.1.7.6 Inadequate or non-existent laws on national or international level 1437
26.1.7.7 Inadequate international co-operation 1437
26.1.7.8 Inadequate governmental or public defence 1437
26.1.7.9 General lack of information about their modus operandi or handling 1437
26.2 CLASSIFICATION 1438
26.2.1 Internet Crimes 1438
26.2.2 Computer Frauds/Crimes 1439
26.2.2.1 Information Piracy and Vandalism 1439
26.2.2.2 Theft of Information Services 1439
26.2.2.3 Organised Crime 1439
26.2.2.4 Infringement of Copyrights 1440
26.2.2.5 Theft 1440
26.2.2.6 Wire Tapping 1440
26.2.2.7 Data Destruction 1440
26.2.2.8 Virus 1440
26.2.2.9 Logic Bombs 1440
26.2.2.10 Spy Software 1441
26.2.2.11 Money Laundering 1441
26.2.2.12 Electronic Funds Transfer 1441
26.2.2.13 Electronic Personation 1442
26.2.2.14 Hacking 1442
26.2.2.15 Crackers 1442
26.2.2.16 Software Piracy 1443
26.2.2.17 Miscellaneous 1443
26.3 COMPUTER CRIMINALS 1444
26.3.1 Employees 1444
26.3.2 Computer Experts 1444
26.3.3 Other Computer Criminals 1445
26.3.4 Handling 1445
26.3.5 Laws, Legislation 1445
26.4 PREVENTION 1446
26.4.1 Access 1446
26.4.1.1 Passwords 1446
26.4.1.2 Cards 1446
26.4.1.3 Biometrics 1447
26.4.1.4 Secrecy 1447
26.4.1.5 Integrity 1447
26.4.1.6 Staff 1448
26.4.1.7 Accountability 1448
26.4.1.8 Logging 1448
26.4.1.9 Encryption 1449
26.4.1.10 Physical Protection 1449
26.4.1.11 Security Software 1450

26.5 COMPUTER CRIME INVESTIGATION 1450
26.5.1 Basis of Investigation 1450
26.5.2 Principles 1450
26.5.3 Action Protocol 1452
26.6 FORENSICS EXPERT INVESTIGATIONS 1454
26.6.1 Tools and Techniques 1454
26.6.1.1 Volatile data 1455
26.6.1.2 Deleted files 1455
26.6.1.3 Data Theft 1455
26.6.1.4 Steganography 1456
26.6.1.5 X-Ways Forensics 1456
26.6.1.6 SANS Investigative Forensic Toolkit (SIFT) 1456
26.6.1.7 EnCase 1456
26.6.1.8 Computer Online Forensic Evidence Ext (COFEE) 1456
26.6.1.9 Bulk Extractor 1456

FORENSIC ANTHROPOLOGY

34.1 GENERAL 1600
34.1.1 Forensic Anthropology 1600
34.1.2 Forensic Anthropologist 1600
34.1.3 Evidentiary Clues 1601
34.1.4 Possibilities 1601
34.2 PRACTICAL POLICE WORK (PPW) 1601
34.2.1 Fundamentals 1601
34.2.2 Scene of Occurrence 1602
34.2.3 Action 1603
34.3 FORENSIC ANTHROPOLOGIST IN ACTION 1605
34.3.1 Forensic Anthropologist at the Scene 1606
34.3.2 Laboratory Investigations 1606
34.3.2.1 Human bones 1607
34.3.2.2 Age Determination 1607
34.3.3 Sex Determination 1610
34.3.3.1 General Appearances 1610
34.3.3.2 Pelvis 1611
34.3.3.3 Skull 1611
34.3.3.4 Examine jaws 1611
34.3.3.5 Miscellaneous 1611
34.3.4 Mode of Death 1611
34.3.4.1 Gunshot Injuries 1611
34.3.4.2 Blunt Weapon Damage 1612
34.3.4.3 Cut Marks 1612
34.3.5 Determination of Stature 1612
34.3.5.1 Long bones 1612
34.3.5.2 Complete Skeleton 1613
34.3.6 Identity of the Victim 1613
34.4 PRESENTATION 1616
34.5 ADDITIONAL READING 1616
34.6 SUPREME COURT CASES 1616
34.6.1 Forensic Anthropology in Action 1616
34.6.2 Identity of Scattered Body Parts 1619

CHAPTER 35
FORENSIC ODONTOLOGY

35.1 GENERAL **1621**
35.1.1 Definition 1621
35.1.2 Application 1622
35.1.3 Background 1622
35.2 IMPORTANCE **1623**
35.2.1 Definite Identity 1623
35.2.2 High Profile Crimes 1624
35.3 NATURE **1624**
35.3.1 Dentition, Teeth 1625
35.3.2 Milk teeth 1625
35.3.3 Permanent Teeth 1626
35.3.4 Tooth Architecture 1627
35.3.4.1 The Crown 1627
35.3.4.2 The Root 1627
35.3.4.3 The cavity 1627
35.3.4.4 Saliva 1627
35.4 PRACTICAL POLICE WORK **1628**
35.4.1 Basic Principles 1628
35.4.2 Scene of Occurrence 1629
35.4.3 Evidentiary Clues 1630
35.4.4 Bites on Dead or Live Body 1631
35.4.5 Action Protocol 1631
35.4.6 Standard Dental Data 1631
35.5 FORENSIC ODONTOLOGIST **1631**
35.5.1 The Expertise 1632
35.5.2 Evaluations 1633
35.5.2.1 Confirmation of Death 1633
35.5.2.2 Identifications in Mass Disasters 1634
35.5.2.3 Mass Murders 1634
35.5.2.4 Mental patient 1635
35.5.2.5 Miscellaneous 1635
35.6 AGE DETERMINATIONS **1636**
35.6.1 Eruptions of Teeth 1636
35.6.2 Teeth Development 1637
35.6.3 Age of Foetus and Infant 1637
35.7 BITE MARKS **1637**
35.7.1 Bite Mark Variables 1639
35.7.2 Identifying Features 1641
35.7.3 Bite Marks Collection 1642
35.7.4 Action 1642
35.7.4.1 Sites 1642
35.7.4.2 Quality 1643
35.7.4.3 Collection of Bite Marks 1643
35.7.5 Bite mark Identification Process 1644

35.8 REPORT **1645**
35.8.1 Recent Advances 1645
35.8.1.1 Dentition Library 1645
35.8.1.2 DNA Profiling 1645
35.8.1.3 Induction of 3-D Photography 1645
35.8.1.4 Computers in Forensic Odontology 1645
35.9 LIMITATIONS **1646**

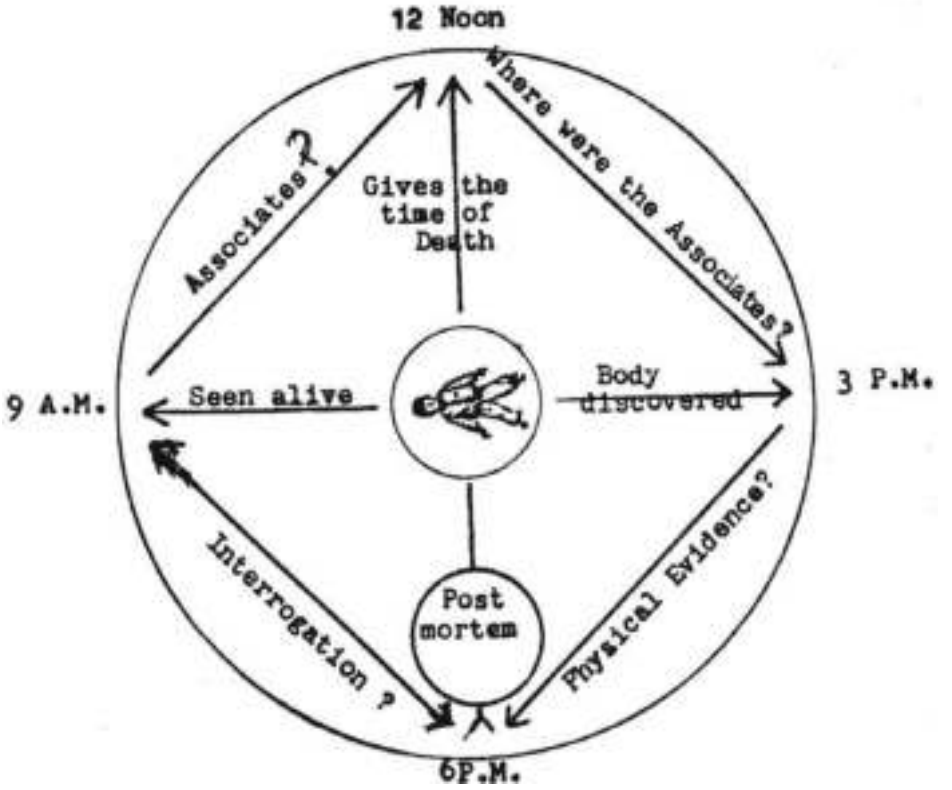

Fig. 1.1
Time element clock

1.1 GENERAL

Forensic Science in criminal investigation and trials is mainly concerned with materials and indirectly through materials with men, places, and time. Among men, the investigating officer is the most important person. In fact, it is his work that determines the success or failure of the application of forensic science in the processing of a criminal case. If he fails to collect the relevant evidences, allows them to be contaminated, mutilated, switched, destroyed, or does not provide correct samples for comparisons, the findings of a forensic scientist will not only be useless; but they will be misleading and even may help the culprit.

Forensic science processes, identifies, and compares the materials. They establish the presence or absence of a link between the crime, the criminal, the victim, the weapon of offence, the place and the time of occurrence *inter se*. The important materials and the processes involved, therefore, form the various chapters of the book. In addition, the place of occurrence (the crime scene) being the most important source of materials has also been discussed.

1.2 NATURE

Forensic science embraces all branches of science and applies them to the purposes of law. Originally, all the techniques were borrowed from various scientific disciplines like chemistry, medicine, surgery, biology, photography, physics, and mathematics. However, in the past few decades it has developed not only its own techniques but also its own branches, which are more or less exclusive domains of forensic science. The science of fingerprints, anthropometry, track marks, documents (especially the examination of handwriting), and forensic ballistics essentially belongs to forensic science alone. In the relatively recent times, significant advances have been made in serology, voice analysis, odour analysis, and in studies relating to pattern recognition, digital photography, automation in processing evidence, and harnessing the computer in the evaluation of the evidence to the extent that it has become an indispensable workhorse of forensics now. The most significant development of the 20th century, in addition to the revolution in information technology, has been DNA profiling for identification of human beings. It has been extended to animals and even to plants.

Two peculiarities characterise Forensic Science:

1. It is multi-professional.
2. It is multidisciplinary.

The forensic scientist has to depend upon the investigating officer, on one hand, for proper functioning of forensic science, and on the presenting counsel and the judge, on the other, for its effective utilisation in the dissemination of justice. If the investigating officer does not know how to collect the correct clues, how to preserve them, how to pack them, and keep intact the integrity and the identity of the clue material, the best of the expertise and the best of instrumentation with the scientists would not help. The investigating officer has to be a specialist in handling the clue correctly. Likewise, the counsel and the judge have to know the science broadly so that they can co-relate the scientific evidence with the rest of the evidence: oral, circumstantial, or of other specialists. Public also has to know the importance of forensic science and the clue materials so that they do not disturb, destroy, or contaminate the clues at the crime scene or elsewhere, and can demand application of forensic science from the authorities if they have failed to do so.

The second peculiarity is that this science is an all-inclusive science and call for comprehensive Forensic Science Laboratories which should have experts in all disciplines, equipment for all branches and comprehensive libraries and other required utilities. It is not possible to do so being too costly to set up the system. Hence, it is not even attempted. The major facilities, which form the bulk of the work referred to the laboratory, are organised. Assistance for the specialities, which are utilised only rarely, is obtained from institutions of higher learning and research, including universities where such facilities are available. The laboratories, in fact, are located at such places where other scientific institutions such as universities, medical institutes, institutes of technology, or other institutes of higher learning, research, and development are available.

1.3 APPLICATIONS

There is an urgent and widespread need for the application of forensic science in the criminal justice system. The present scenario of crime investigation and prosecution of criminals in India is rather dismal. A large percentage of the trials, in heinous crimes, ultimately end in acquittals. The official figure for the acquittal is very high. Unofficial figures are even higher, above 90%. It is estimated that the prosecution agencies spend lakhs of rupees on each trial. Thus, not only the money stands wasted in acquittal cases, but worse still, a dangerous criminal goes scot-free and is let loose in the society. The worst consequence of these frequent acquittals

is that the citizen loses respect for the law. The acquittals embolden the criminals. They escalate crime and burgeon criminals.

The need for the application of science in the dissemination of justice is imperative. Many factors including the following are responsible for the same.

1.3.1 Social Changes

The society is undergoing drastic *social changes* at a rapid pace. India has changed from a colonial subject nation to a democratic republic. Sizeable industrial complex has sprung up. The transport facilities and the means of communications have been revolutionised. A criminal may commit a crime and in two hours he may be an anonymous figure in any metropolitan city.

Satellite communications were used to guide the terrorist group in Mumbai while the mentors were sitting cosily in Karachi and watching the ongoing holocaust.

There is a growing shift from a rural to an urban society. These changes have made the old techniques of criminal investigation obsolete. In British days, the police was so much feared that once it laid hands upon an individual, he would "confess" to any crime, he may not have even known. The fear is vanishing now. However, the use of those "third degree methods" continues even today[1]. Besides, the abuse of the Third-Degree Methods is not only becoming increasingly less effective but it is becoming hazardous to the perpetrator increasingly. It does not find favour with the current generation of the administrators, the judges, and the public at large.

Other legal, effective, efficient, and humane methods must fill the vacuum.

1.3.2 Anonymity

The quick means of transport and the high density of population in cities have facilitated the criminal to escape from immediate arrest (and punishment) after the commission of crime. The criminal can hide himself in a corner of a city or move away to thousands of miles in a few hours after committing a crime at a particular place. Nobody, at the new place, would know or try to know who he is or where he has come from. He, thus, often escapes apprehension and prosecution.

The individual is becoming self-centred. He, especially in cities, does not know even his next-door neighbour. Thus, even if the neighbours are killed, the murders come to light many days later; sometimes only when the bodies putrefy and emit a foul smell. In the meanwhile, the culprit(s) leave the scene and the evidence is also destroyed, obscured, becomes indistinct, or diminished.

> *Anuradha Bali, a lawyer in Punjab and Haryana High Court eloped with an already married person, Deputy Chief Minister of Haryana (who had to resign later), lost her job and later was divorced. She was found dead on 4 August 2012 in a small house in Chandigarh. The stink from her putrefied body revealed her death. (CH)*

1.3.3 Technical Knowledge

The technical knowledge of an average person has increased tremendously over the years. The criminals are using this technical knowledge. The crime techniques are getting refined. The investigating officer, therefore, needs to know and use scientific methods to combat the modern scientific criminal. For example, some years ago, the terrorists in Punjab using night vision appliances killed many police personnel. The security forces could meet the challenges only when they also employed night vision devices to fight them.

1. Between 2001 and 2013, 1275 custodial deaths occurred in India. (NCRB data) National Human Rights Commission (NHRC) recorded 14,231; i.e., 4.33 persons died every day in police and judicial custody in India from 2001 to 2010. This includes 1,504 deaths in police custody and 12,727 deaths in judicial custody.

Fig. 1.2
The race between criminal and state

1.3.4 Wide Field

The field of operation of the criminals is widening at a terrific rate. Formerly, the criminals were usually local, now we find that national or international criminals are a common phenomenon. Smuggling, drug trafficking, money laundering, financial frauds, and forgeries offer fertile and ever-expanding fields.

International terrorism is a developing horrific phenomenon. The IS terrorist of Arabia has gone global. No country can call themselves safe. The terrorists are using gadgetry, which is truly overwhelming to the common investigator.

> *The attack on the World Trade Centre in New York and on Pentagon in Washington, in 2001, destroying property worth billions of dollars and killing thousands of persons, in one go, is really more than an eye-opener to the world about the capabilities of the terrorists. (CH)*

Cybercrimes have gone beyond the earth — in the space, though the perpetrators are earthly beings. They use ultra-high sophistication.

1.3.5 Better Evidence

Forensics evaluate physical evidence, which is objective. If a fingerprint is found at the scene of crime, it can belong to one person only. If this person happens to be the suspect, he must account for its presence at the scene. Likewise, if a bullet is recovered from a dead body, it can be linked to only one firearm. If this firearm happens to be that of the accused, he must account for its involvement in the crime. Such evidence is always verifiable. It is free from human failings other than outright dishonesty.

Fig. 1.3
Eye-witnesses not always reliable

1.3.6 Alternatives

If we do not adopt scientific methods, what are the other alternatives and what is their ultimate utility?

The alternatives to scientific methods that have been in vogue since time immemorial are:

- Eye Witnesses
- Confessions
- Approvers
- Stock Witnesses

1.3.6.1 The eyewitnesses

The eyewitnesses were/are the kingpins in the criminal justice system. They rule the roost even today. Their evidence is likely to continue to be the most depended upon evidence for some time to come. However, the eyewitness' accounts have inherent weaknesses. Observation power, memory, descriptive skill, emotional inputs, bias, conformational syndrome, and subconscious rationalisation of the eyewitnesses affect the evidence tremendously. The actual observational content of the account of the eyewitness becomes highly subjective and hence, the suspect. Besides, emotional involvement, unconscious bias, and influence of others, especially that of the media, make the evidence of the eyewitnesses highly unreliable. Yet we continue to depend upon the evidence, almost religiously. It results in miscarriages of justice, as it actually took place in the famous case of *Adolf Beck*:

> *There was one John Smith. He defrauded women of their petty belongings after gaining their confidence. His technique was to contract an acquaintance with a woman and visit her residence. After some time he would suggest that she should live with him as his mistress, to which the woman would agree. He would collect some petty items (like a ring) and borrow small amounts of money and would disappear. After some time he was caught and convicted for these frauds.*

Fourteen years after his release, the frauds started again. The modus operandi was the same. One Adolf Beck was suspected to be John Smith. He was found to have some significant differences: (i) He had a German accent while John Smith was reported to have normal accent; (ii) He dressed himself shabbily, whereas John Smith was known to dress properly — a necessity for the kind of fraud; and (iii) he wrote clumsily, whereas John Smith was known to have a good handwriting. But twelve women identified him to be John Smith who had defrauded them! Only one woman was positive that he was not the man. The court convicted him for the crimes on the testimony of these eyewitnesses and imprisoned.

The defending counsel for Adolf Beck was convinced of his innocence. He tried his best to get him released but without success.

About two years after his release, the frauds were repeated. Adolf Beck was again in the dock and convicted on the identification of a set of four women!

He was still in the judicial lockup, awaiting imprisonment, when the frauds were again committed. This time the real man, John Smith was apprehended. He admitted to have committed all the sixteen frauds for which Adolf Beck was convicted.

The authorities instituted an inquiry and found their follies in convicting Adolf Beck. He was released and compensated monetarily for wrongful convictions.

The inquiry's made a significant comment:

The evidence as to the eyewitness accounts is highly dangerous and nobody should be convicted on the evidence of the eyewitness accounts only. (CH)

1.3.6.2 Confessions

True **confessions** are rare. Most of the confessions put up before the courts in India are obtained through *Third Degree* methods, which are illegal, unethical, and inhuman. They are retracted frequently. Besides, in the changed social/political scenario, they often recoil.

Fig. 1.4
Dictated confessions

1.3.6.3 Approvers

The **approver** is an approved class of witness. He confesses or accepts his role in the commission of the crime for personal pardon. He, thus, saves his skin, implicates his friends and perhaps relatives also. He is an unethical witness, though he is a legally correct witness. He often

retracts his statement especially if he finds his good going on the other side. His services are a slur on our justice system.

1.3.6.4 Stock Witnesses

The abuse of **stock witnesses,** like Prem Chand Paniwala,[2] is not only shameful but it is also illegal and a degradation of human values. It is indeed a curse on the society. Besides, the utility of the stock witness, who appears time and again, is limited. The court and the counsel become aware of the character and activity of the stock witness. He is exposed. Yet it goes on. Is the creed of the stock witnesses dwindling? It does not seem to.

Fig. 1.5
The above stock witness was the convenient '*witness*' in over 200 cases

1.3.6.5 The Genie against Crime

Forensic Science has progressed tremendously over the past years. It has crossed all physical barriers as far as the analysis of the evidentiary clues are concerned. Even the tiniest clue of a nanogram or less can be analysed. Forensic Science, therefore, in position, is the IO's Genie to provide the help practically in all cases and in all aspects.

The traditional evidential inputs have become inefficient. The result is frequent acquittals of the criminals. They have to give way to better evidence to control the downward slide in the dissemination of justice.

Forensic science is the modern source of furnishing evidence to find "the truth, the whole truth and nothing but the truth". It holds the beaconing light to criminal justice system to provide real evidence for or against a suspect, because:

- Evidence is always available. Locard's Principle of Exchange, ("every contact exchanges traces") holds.
- Forensic Science can link the culprit with the crime, the victim, the scene, the weapon, and other evidence *inter se* decisively in most of the cases through exchanged evidentiary clues. They are unique. The Law of Individuality holds.

2. *Prem Chand v UOI,* AIR 1981 SC 613 : (1981) 1 SCC 639 : 1981Cr L J 5 (SC).

- Evidence is free from human failings: "bias", "emotions", "rationalisation", "memory lapses", "perjury", and others provided, the scientist is honest, trained, experienced, and dedicated.
- Is verifiable. Other honest scientists can confirm the findings.
- Is efficient: time and cost-effective. Automation and computers have conferred wings to the evaluation processes.

In a nutshell, forensic science is the modern avatar which holds the key to the dissemination of real/true justice for the above reasons.

Promotion and use of Forensic science on a much larger scale is the need of the hour to improve the criminal justice system so that it can serve the society effectively.

1.4 FUNCTIONS

Forensic science performs many functions including the following:

1.4.1 Establish *corpus delicti*[3]

Consider the case of the recovery of a dead body. Death could be natural, accidental, suicidal, or homicidal. Forensic science ascertains the nature of death to establish whether the death was homicidal or non-homicidal. Likewise, it determines whether the given incident is a crime/faked incident/accident/Act of God (Nature). It establishes the existence or non-existence of *corpus delicti.*

Fig. 1.6
Establishing corpus delicti

1.4.2 Determines the *Modus Operandi* of a Crime

The examination of the *corpus delicti*, the crime scene, the evidentiary clues, and the circumstances surrounding the occurrence indicate the possible *modus operandi*.

3. Body of crime.

1.4.3 Identifies the Criminal

Forensic science establishes the identity of the culprit through many clues, in many situations, including the following:

1. The culprit's mobile telephone record may point the needle of suspicion towards the suspect.
2. His computer (SMS, E-mails, transactions) may give details relating to the participation/promotion of the crime.
3. He may leave clues like fingerprints, footprints, tyre prints, hair, blood drops, saliva, semen, or other body fluids at the scene, on the victim, on the weapon of offence, on objects at the scene, in the vehicle he used in the commission of crime or on the arrival/departure routes.
4. He may pick up similar clues from the victim, from the scene, and the paraphernalia thereon.
5. He may leave objects and materials at the scene in the crime vehicle on the weapon of offence or with the victim, or picked up from these entities (scene, victim, and vehicle).
6. The time Analysis of whereabouts at the material time may place at the crime scene.
7. The circumstances surrounding the case may connect the suspect with the crime.

1.4.4 Identity of the Victim

Forensic science through the personal clues on the person of the victim (deceased) helps to identify the unknown deceased/mutilated body/skeletal remains. DNA profiling and fingerprints are the most important clues in this respect. However, the clues mentioned under para 1.7 are equally valid for the identification of the victim.

1.4.5 Miscellaneous

The forensic scientist helps criminal justice system in many other ways including the following:

1. The forensic scientist provides leads to the investigators.
2. He discriminates the real crime scene from the fake.
3. He locates hidden clues, identifies correct clues, and helps to collect proper samples clues for comparison.
4. He establishes a sequence of events.
5. He appraises/verifies the prosecution/defence and finds the correct versions.
6. He helps to identify the innocent accused by de-linking him, *via* clues, with the victim or with the scene of crime.
7. He identifies the correct crime weapon.

1.5 DEVELOPMENT

Forensic Science for effective application in criminal investigation demands multi-professional approach:

1. The investigating officer has to know it.
2. The counsels have to understand it.
3. The judges have to comprehend/appraise/utilise (or discard) it.

The investigator is the *prima donna* in the process. He collects the physical evidentiary clues. He has to know:

1. The nature of physical clues, which are to be collected.
2. Where they are located.
3. How they are collected, preserved, packed, dispatched, and maintaining their identity, integrity, authenticity, and chain of custody.
4. What standard samples for comparison purposes are necessary; and where they are available?
5. How much sample is required and how the sampling is done, how it is collected?
6. What he expects from the analysis of the clues, and what are the forensic possibilities of the forensic analysis?
7. How the analysis results fit with the other evidence (eyewitness accounts, circumstantial evidence,)?

In short, the investigator has to be a specialist in utilising forensics in his own right. The investigating officer is, therefore, given a thorough grounding, both in theoretical and practical aspects, in the above elements at the police training institutions where they have courses on scientific aids. However, the syllabi and the teaching standards are far from satisfactory. They should involve forensic specialists on a large scale in teaching. Periodical attachment of investigating officers to the departmental forensic science laboratories can go a long way in inculcating the scientific spirit and methodology. Some police departments have taken up the initiative; others are likely to follow suit.

The other professionals involved, the lawyers and the judges must also know forensics, its potentialities and limitations, so that they can utilise the evidence correctly and fully in the dissemination of justice.

The public should also know the basics; how to preserve the evidence at the scene or with the victim, so that the authenticity and integrity of the evidence remains intact and the evidence can provide an irrefutable linkage between the criminal and the crime.

1.5.1 Academic Courses

Academic courses in forensic science have come up in many Indian Universities and Institutions. Most of them run postgraduate courses. Some of them (Sagar University, MP, Bundhelkhand University Jhansi, and others) also runs a graduate course. Some others have diploma/certificate courses, which are mainly meant for the non-specialist professionals (police, lawyers, and advocates), who use forensics in their profession. Some universities have introduced Forensics as one of the subjects taught in science degree courses.

In fact, there have been a mini-explosion of academic courses in Forensics in India in the past one or two decades. More than 50 universities/institutes have started various courses. However, most of these institutions are poorly staffed and equipped. It will take some time before they come up with respectable standards.

1.5.2 Research

There are few whole-time researchers in forensic science. This is in spite of the fact that the field is yet unexplored. A few research papers, however, do appear in journals. They are mostly by persons engaged in actual laboratory routine. Some interesting facets of a problem may coax the scientist to investigate the problem further. Or, a sheer necessity in the examination of a case may compel him to carry out experiments on an extensive scale. An average laboratory

worker is too busy with the routine to find time for research. Induction of Forensic Science in the Universities augurs well for research. Persons are taking up research for doctoral degrees.

1.5.3 Dissemination

Forensic Science is not confined to the four walls of a Forensic Science Laboratory, and it is not the concern of forensic scientist only. Its ramifications involve all, particularly the public and all constituents of the criminal justice system. All must know to create better law and order conditions. Proper dissemination of forensic science knowledge is, therefore, indisputable. Modern modes of dissemination like multimedia and internet should be utilised.

Common inter-agency forums should be a standard feature. Here, the police officers, the forensic scientists, the lawyers, the judges, and even the laity should get together and discuss topics of common interest. The print media, conferences, seminars, and formation of societies should also contribute to spreading information all around.

1.6 PRINCIPLES

The laws and principles of all the sciences form the bases of forensic science. In addition, it has also developed its own principles.

1.6.1 Law of Individuality

Every object, natural or manmade, has an individuality, which is not duplicated in any other object. It is unique. Neither the nature has duplicated itself nor can man.

This principle, at first sight appears to be contrary to common belief and observations. The grains of sand or common salt, seeds of plants, or twins look exactly alike. Likewise manmade objects: coins of the same denomination in the same mint, currency notes printed with the same printing block one after the other (excluding the serial number), and typewriters of the same make, model, and batch appear to be indistinguishable. Yet the individuality is always there. It is due to small flaws in the materials, in the arrangement of crystals, imperfect stamping, or due to inclusion or exclusion of some extraneous matter.

The individuality has been verified in certain forensic fields. The most extensive work has been carried out in fingerprints. Millions of prints have been checked but no two fingerprints, even from two fingers of the same persons have ever been found identical.

In a series of experiments carried out by the author during the study of superimposition techniques for fingerprints, footprints, footmarks, die marks, and marks obtained from various parts of firearms, it was observed that with the best of efforts exactly alike imprints even from the same finger could not be produced, which could be superimposed perfectly. The fingerprints were taken one after the other, on the same paper, with the same ink, and by the same person; yet a perfect duplication to give a perfect superimposition could not be achieved. Imperfect inking, unequal pressure, slight differences in the texture of the surface of the paper, or interference from extraneous matter always introduce some differences. If the same finger failed to give identical prints, it is difficult to imagine that exact duplication can be achieved with any other object.

The law of individuality is fundamental in forensic science. Anything and everything involved in a crime, has individuality. Thus, the culprit is unique, his *modus operandi* is unique, his weapon of offence is unique, scene of crime is unique, evidentiary clues, leftover or picked up by the culprit, are unique. We only have to identify the uniqueness to link the crime with the criminal.

1.6.2 Principle of Exchange

Whenever two entities come in contact, mutual exchange of traces takes place.

Edmond Locard, who enunciated the principle, has put in beautiful words:

Fig. 1.7
The linkage—"contact leaves traces"

Edmond Locard Explains

Wherever he (offender) steps, whatever he touches, whatever he leaves, even unconsciously, will serve as a silent witness against him. Not only his fingerprints or his footprints, but his hair, the fibers from his clothes, the glass he breaks, the tool mark he leaves, the paint he scratches, the blood or semen he deposits or collects. All of these and more, bear mute witness against him. This is evidence that does not forget. It is not confused by the excitement of the moment. It is not absent because human witnesses are. It is factual evidence. Physical evidence cannot be wrong, it cannot perjure itself, it cannot be wholly absent. Only human failure to find it, study and understand it, can diminish its value.

This is the principle or law of exchange. The French scientist, Edmond Locard, was the first person to enunciate it. The law of exchange is also known as Locard's principle.

According to the principle, when a criminal and/or his instruments of crime come in contact with the victim or the objects surrounding him, they leave traces. Likewise, the criminal and/or his instruments pick up traces from the same contact. Thus, a mutual exchange of traces takes place between the criminal, the victim and the objects involved in the crime. If these left over/picked up traces are linked to the corresponding original sources (culprit/victim/scene/objects around the victim at the scene), they establish the contact and link the criminal/victim/scene/weapon of offence, *inter se*.

The principle of exchange is vividly demonstrated in hit and run cases. Numerous evidentiary clues are exchanged including paint, glass, vehicle's broken parts, scratches/ impressions/indentations, spilt fuel oil, Mobil oil, lubricants, greases, mud, dust, fibres, hairs, clothe pieces, blood, other body fluids, tracks and trails, scent, foot and footwear marks and tyre marks (skid), and many more clues.

All contacts in crime exchange traces. Chance fingerprints, tool marks, dust, paint, soils and professional dust, body fluids, and fibres are the prominent clues. It is difficult to imagine a crime where the criminal, the victim, the crime scene, or the objects involved, would not exchange traces. Of course, the dimensions/quantities and the forms of the clues vary.

The basic requirement of the principle is the identification of correct sites or objects with which the criminal or his tool actually came in contact. If the investigating officer is able to establish the points of contact, he is likely to reap a rich harvest of physical evidentiary clues.

If a culprit enters the premises through a ventilator, he leaves his footprints in dust on the sill. He also picks up dirt from the place.

If he breaks a window or a door, the jimmy or other instrument used, leaves its marks on the wooden frame. Fragments of paints, wood, and glass also get transferred to the jimmy, to the clothes or person or the culprit.

The clothes of a burglar (including shoes), who opens a safe by an explosive, are covered with insulating material as well as some exploded and some unexploded explosive materials. He carries them with him wherever he goes, until they are dislodged intentionally or otherwise. If he is apprehended in time, the collection and evaluation of the traces can link him with the explosive, explosive device, and the explosion.

The culprit leaves and carries minute traces only, in most of the cases. It is seldom that he dares or neglects to leave or carry gross objects or traces. On a thorough search, the traces connect the crime and the criminal as effectively as the gross objects, perhaps more subtly.

1.6.3 Law of Progressive Change

"Everything changes with the passage of time".

In other words, nothing is permanent immutable or non-variable. The rate of change varies tremendously with different objects and under different situations.

The impact of the law on forensic science is immense.

The criminals undergo progressive changes. If the criminal is not apprehended in time, he becomes unrecognisable except perhaps through his fingerprints, bone fractures, or other characteristics of permanent (comparatively speaking) nature. They are not always available. The best mode for identification, which now forensics provides, is DNA profiling.

The scene of occurrence undergoes rapid changes. The weather, the vegetable growth, and the living beings (especially humans) make extensive changes, in comparatively short time. Longer the delay in examining the scene, greater will be the changes. After some time, the scene may become unrecognisable. For example, the evidentiary clues in a road accident on a busy road will lose all evidence if the same is not protected/collected/ processed immediately.

The objects involved in crime also suffer change. The firearm barrels are "washed" by the hot gases. The process increases the bore diameter. Metal objects rust. The shoes suffer wear and tear. Repeated use of the tool changes the functional surface characteristics. The extent of change depends upon the time, the upkeep, the atmospheric conditions and the extent and frequency of use/misuse of the particular tool. In the course of time, the object may lose all evidential peculiarities for practical identity *vis-a-vis* a particular crime committed earlier.

The principle, therefore, demands prompt action in all aspects of the criminal investigation.

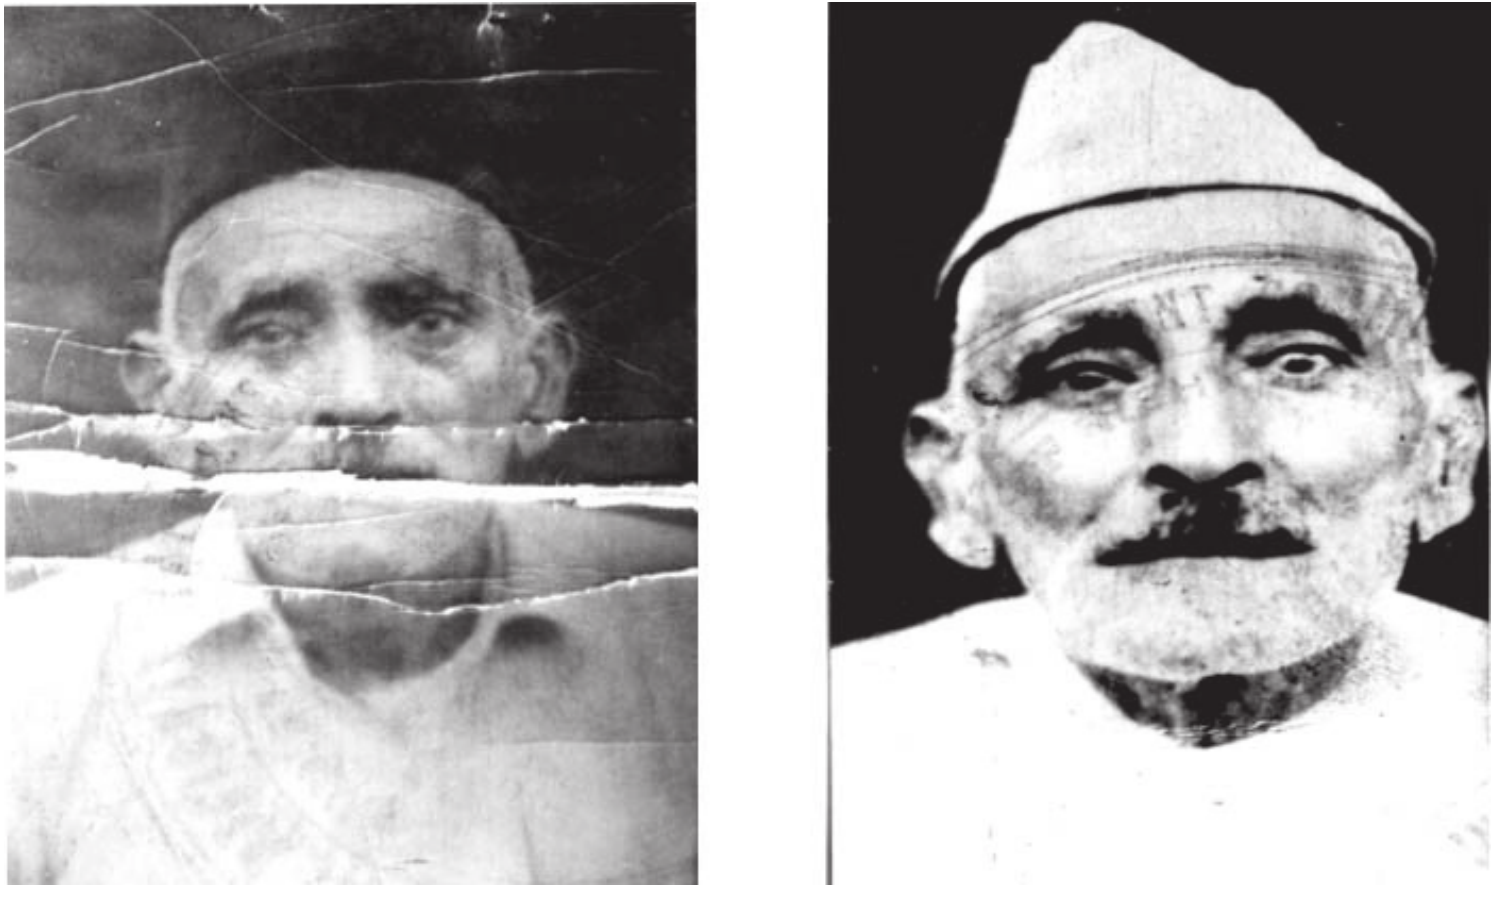

Fig. 1.8
The leader after 25 years. Are the two same? Ears indicate so

1.6.4 Principle of Comparison

"Only the likes can be compared."

It is the principle of comparison. It emphasises that the necessity of providing corresponding samples/specimens/standards for comparison with the questioned items:

In a murder case, a bullet is recovered from the deceased body. The expert opines that the bullet has been fired from a firearm like a service rifle, firing high velocity projectiles. It is futile to send shotguns, pistols, or revolvers as the possible suspect firearms.

A bunch of hair is recovered from the hands of the deceased. The expert opines that the hair belongs to a Negroid person. Hair from persons of white races for comparison will not be of any use.

If the questioned writing is written with a ball pen, it is futile and absurd to send a fountain pen to link the writing with the instrument.

> *Writings, allegedly written on a wall, made available through a photograph, did not give worthwhile results when compared with specimens written normally on a paper. The author requested the investigating officer to provide corresponding specimens written on the same wall, at the same height and with the similar instrument (a nail). It allowed comparison. (CH)*

> *A few years ago, an investigating officer sent moulds bearing footwear impressions lifted from the scene of occurrence along with specimen moulds prepared before a magistrate. The sole patterns were different. An inquiry revealed that the investigating officer had used new pairs of shoes to get the specimens prepared. The investigating officer thought that the culprit could be identified from the pressure patterns from the individual impressions on each mould! (CH)*

1.6.5 Principle of Analysis

"The analysis can be no better than the sample analysed".

Improper sampling and contamination render the efforts of an experienced analyst useless even when he uses the correct tools and techniques. The principle emphasises the necessity of correct sampling and correct packing for useful and worthwhile results.

A criminal while is running away from the scene of occurrence, brushes against a painted surface. Some powdered particles of paint get deposited upon the clothes. The investigating officer scrapes a few grams of paint from the nearby surface with a penknife and sends it as control sample. The result of the analysis shows that the two paints do not match. Why?

A small amount of dust is recovered from a small sticky patch of the shoe of a culprit. The investigating officer collects about 2 kg of soil from the scene, packs it in a tin and sends it as a control sample. The result of comparison is inconclusive. Why?

In a rape case, the investigating officer collects the clothes of the victim. The clothes carry both blood and semen stains. The investigating officer dries the clothes, packs them together and sends them through a railway parcel. He wants to know if the clothes carry semen stains, and if so, to which blood group does the culprit belong? The semen gave AB group. The culprit had A group. The victim had B group.

Why the wrong results?

1.6.6 Law of Probability

All identifications, definite or indefinite are made consciously or unconsciously on the basis of probability.

"Probability" is misunderstood by most. If we say that according to probability a particular fingerprint has come from the given source, the defence counsels plead that it is not a definite opinion. Consequently, it is not customary to talk of "probability" or "probability figure" in courts.

Probability is a mathematical concept:

It determines the chances of occurrence of a particular event in a particular way, out of a number of ways in which the event can take place or fail to take place with equal facility.

If P represents probability, N_s the number of ways in which the event can successfully occur (with equal facility) and N_f the number of ways in which it can fail (with equal facility), the probability of success is given by the formula:

$$P_s = \frac{N_s}{N_s + N_f}$$

If the event consists of two occurrences, which can take place *independently*, the probability of the second occurrence is also given by the same formula. If we denote probabilities of the first and second occurrences by attaching digits 1 and 2 to the relevant letters, the net probability (P_t) is given by the formula:

$$P_t = P_1 \times P_2$$

Likewise, if the event consists of "n" independent occurrences, the net probability of the event is given by:

$$P_t = P_1 \times P_2 \times P_3 \ldots P_n$$

Similarly, if the probability relates to separate events, the net probability is given by:

$$P_t = P_1 + P_2 + P_3 + \ldots P_n$$

A coin is flung. It can rest either head-upward or tail-upward with equal facility. The chances of success therefore are:

$$P_s = \frac{1}{1+1}$$
$$= \frac{1}{2}$$

An unknown woman is found murdered. The corpse has one gold-plated tooth, a tattoo scar on its left hand, and a healed fracture of the collarbone. A woman with these characteristics is reported missing. What is the probability of the corpse being the missing woman? (Given the occurrence of the gold-plated teeth in the area, 1 in 5000, collarbone fractures 1 in 20000, and of tattoo scars 1 in 100).

Here

$$P_1 = \frac{1}{5000} = \frac{2}{(10)^4}$$

$$P_2 = \frac{1}{20000} = \frac{5}{(10)^5}$$

$$P_3 = \frac{1}{100} = \frac{2}{(10)^2}$$

$$P_t = P_1 \times P_2 \times P_3 = \frac{2}{(10)^4} \times \frac{5}{(10)^5} \times \frac{1}{(10)^2}$$

$$= \frac{1}{(10)^{10}}$$

Thus, the chances of the corpse being of another woman are 1 in 10,000,000,000.

We have neglected other factors (sex, age, and dress) and even without these additional factors, the identity of the deceased is established beyond "reasonable doubt".

1.6.7 Likelihood Ratio

Reverend Thomas Bayes, in the 18th century, gave a concept of calculating the chances of occurrence of an event in the form of finding the **Likelihood Ratio** of an occurrence. The idea, in recent decades, is being applied to chances of occurrence relating to Forensic events. The main improvement over the simple probability is that it takes into consideration the prior factors influencing the occurrence of the current incident and the probability of those prior factors is calculated and used in the calculations. The Bayesian probability is then obtained by multiplying the two probabilities.

In the calculation Bayesian probabilities, for both the chances of occurrence and non-occurrence, are calculated. The ratio of the two gives the **Likelihood Ratio**. Thus:

Probability of common source (say)	= 95%
Probability of non-common source	= 5%
then: Likelihood Ratio of common source	= 95/5
	= 19/1; or 19:1
Similarly Likelihood Ratio of non-common source	= 5/95
	= 1/19; or 1:19

Notes:

1. The two probabilities are calculated independently.
2. The Likelihood Ratios are also called **"Odds"**.
3. Knowledge of the prior events and their extent of influence on the current occurrence must be known.

1.6.8 Facts do not Lie

"Facts do not lie, men can and do". It indicates the importance of circumstantial evidence *vis-a-vis* the evidence of the eyewitnesses. The testimony of the eyewitnesses is modified

by auto-suggestion, external influence; suggestions, descriptions, and opinions of others; conscious or unconscious bias and rationalisation. Eyewitness accounts, therefore, is coloured, whereas material evidence is free from these infirmities.

But the material evidence can be manipulated:

1. A person is killed in an accidental firing. The relatives want to implicate their opponents. They procure an unlicensed firearm, fire a cartridge, place the empty firearm at the scene, and plant the firearm on the opponent.

   The police recover the shell and the firearm. The shell is married to the firearm. The police prosecute the person.

2. A person is in the armed forces. He is seen carrying out duty up to 1 a.m. in the unit. He slips through the guarded premises, goes about a 100 miles, commits a murder, returns to his unit, enters into the guarded premises secretly, and he is present on duty at 7.30 am.

   He proves his presence in the unit throughout the night by circumstantial evidence.

3 *A* threatens *B* with death. The next day *B* is found murdered. *B* had no other enemies except *A*. Police suspects *A* as the murderer. He is not found anywhere. He is declared a proclaimed offender. Soon after "A" appears before a magistrate and says he had gone on a pilgrimage, but checking at the allegedly visited places, his visits to the places are not established. He is arrested and prosecuted. In defence, he produces the jail record. He was behind the bars at the relevant time. He escapes the sentence.

1.7 TOOLS AND TECHNIQUES

The tools and techniques of forensic science are oriented to meet the following exacting demands in analysis:

- Sensitivity
- Specificity
- Rapidity

The instruments and technique should be highly sensitive, because the quantities of materials involved are extremely small, often in micro, sub-micro, or microscopic ranges. For example, a few milligrams of certain poisons are sufficient to kill a person. The quantity is distributed in the whole body. Only a few hundred grams of the body matter is provided for analysis. The sample contains quantities of the poison only in micro or nanogram ranges. It must be identified correctly. In comparatively recent times, the quantities involved in some crimes like offences under drug acts have gone infinitesimally small, for example the LSD's dose in micrograms and designer's drugs like Fentanyl, are used in nanogram ranges only.

Paints, soils, dusts, inks, and body fluids clues are sometimes found in sub-micro quantities.

A clue material has to be identified positively in most of the situations. Otherwise, the evidentiary value of the clue is limited. The tools (instruments) and techniques must, therefore, be highly specific. In a poisoning case, it is not sufficient to identify the killer drug as a barbiturate but it is necessary to find out which one it is, so as to trace its source.

The number of cases requiring evaluation of clues is increasing every day. The tools and techniques, therefore, have to be time-effective.

Classical processing of viscera for poisoning involves lengthy procedures of extraction, purification, identification, and estimation. The results are checked and crosschecked for mistakes. Modern techniques may eliminate most of these steps. For example, a poison is extracted from the convenient body part (say blood, urine, lungs, hair, or kidneys). It is identified through chromatography (thin layer, gas/liquid/GS-MS). The quantity is estimated through ultra-violet-spectrophotometry and specific poison is identified through infrared spectrophotometry, FTIR, or mass spectrography. The classical method needs days and weeks for the complete analysis, whereas the above procedure identifies and estimates the clue material in a few hours. Similarly, gas chromatography identifies/estimates blood alcohol in a few minutes. A drop of blood (or less) sample is sufficient.

There are other techniques such as DNA Profiling, Brain fingerprinting, Brain mapping, Narco-Analysis, Polygraph test, Forensic photography, Laser Ablation Inductively Coupled Plasma Mass Spectrometry (LA-ICP-MS), High-Speed Ballistics Photography, Video Spectral Comparator 2000, Magnetic Fingerprinting, and Automated Fingerprint Identification (AFIS), which play pivotal role in criminal investigations to find out the crime and criminals. Today the investigating authorities are employing these effective techniques in solving the crime problems.

Modern forensic science laboratories, in India, use both classical and modern tools and techniques.

1.7.1 Measurements

Examination of clue materials requires numerous types of measurements. Determination of dimensions (length, breadth, height, depth, curvature, and diameter) angles, melting point (including mixed melting points), boiling points (including boiling point curves and ranges), densities, refractive indices, birefringence, and fluorescence is a daily routine. They require elementary knowledge of science, yet they fix the identity of a material in a number of cases.

Refinement of techniques has improved efficiency and accuracy considerably over time. For example, density gradient tubes have permitted density determination of very small amounts with high accuracy. Likewise, using a hot stage, in Beckline method, small differences in refractive indices can be determined very accurately.

1.7.2 Microscopy

A microscope is one of the most important tools of a forensic science laboratory. It is used in most of the branches (disciplines).

A microscope in its simplest form is a magnifying lens. Continuous improvement and inventions have given a variety of microscopes suitable for different purposes. Compound microscopes, stereomicroscopes, comparison microscopes, fluorescence microscopes, phase contrast microscopes, and metallurgical microscopes are common items in forensic science laboratory.

The use of infrared microscopy (by using an image converter) and scanning electron microscopy (magnification of the order of 20 X to 30,000 X) are comparatively recent innovations. They are being used increasingly in forensics. For example, Scanning Electron Microscope (SEM) is becoming indispensable in Forensic Ballistics (GSR analyses) and Micro-Trace Analysis.

1.7.3 Photography

Photography of old days is vanishing. It's avatar digital imaging in its numerous forms finds extensive use in forensics. It is indispensable in documentation of crime scene, identity record of the criminals, and collection of evidence. It is also used to demonstrate invisible traces, visually unrecognisable clues, stains, and the like. Ultraviolet rays, infrared rays, X-rays, and coloured filters have widened the vision of the forensic scientist. Macro-graphs (magnified photographs), micrographs (photograph of microscopic evidence taken in conjunction with a microscope), microphotography (miniature photography), video-filming have conferred additional handling arms to criminal justice system in general and to the forensic scientist in particular.

The variety of cameras used is very large. The traditional camera has given way to the digital camera, which is changing the scenario of Forensic Photography. Its convenience, quality, cost, and other advantages have more or less pushed out the film photography from the field[4].

Holography is a relatively recent innovation. Here photographs (holograms) are taken with the help of a laser beam. The technique can photograph prints and impressions even on carpets and grass.

1.7.4 Invisible Rays

The use of ultraviolet rays in a criminal investigation is well-known. The use of infrared and X-rays are comparatively later additions and are making their impact increasingly.

Some materials/surfaces absorb ultra-violet rays. The surface fluoresces, thus the invisible entities become visible. The phenomenon is called fluorescence. The absorption power of different materials varies greatly. Even small differences in the surface structures of an item give different fluorescence. The differences help the observer in the identification and differentiation of erasures, stains, sealing waxes, papers, inks, dyes, paints, varnishes, and more importantly forged and genuine currency notes.

Infrared rays have greater wavelength than the visible light. They also have penetration power and pass through some materials. They are useful in the examination of documents, clothes, stains, and the like.

The X-rays have the shortest wavelength of the three types of rays. They have greater penetration power and give fluorescence under suitable conditions (*e.g.*, on a specially coated screen). They are useful in the study of paintings, documents, bullet holes, and fractures, and for locating metal objects in sealed containers (or foreign objects in a body).

1.7.5 Chromatography

Chromatographic techniques have assumed great importance in forensic science. All its forms: Column Chromatography, Thin Layer Chromatography, High Performance Liquid Chromatography, and Gas Chromatography are handy tools. They are used to separate, purify, identify, and estimate clue materials even in sub-microgram quantities. The impurities do not substantially interfere during the analysis.

4. See chapter 'Digital Images'.

1.7.5.1 Column Chromatography

Column chromatography is mainly used to isolate/purify a substance and to separate mixtures. The material is dissolved in a suitable solvent and passed through a suitable stationary phase, packed in a column. The substance is then eluted with one or more solvents. The required material, due to difference in adsorption power, is eluted out of the column in a pure form at different phases, before or after the impurities and other constituents of the mixture, depending upon their solubility and adsorption powers.

Paper chromatography is similar in principle and action. Paper's cellulose fibre and water absorbed by the paper constitute the stationary phase. Two dimensional and reversed phase chromatography are additional innovations in paper chromatography.

Paper chromatography is used for identification, isolation, and purification of the clue materials. For this purpose, the ratio of the distance travelled by the material and the solvent is found, which is characteristic of the substance. It is called the $\mathbf{R}_f$ value of the substance for the system. Circular paper chromatography is handier for the purpose. However, Thin Layer Chromatography (TLC) has almost completely replaced the paper chromatography techniques. The latter gives better separation and less tailing. It is quicker also.

1.7.5.2 Thin Layer Chromatography (TLC)

Thin layer chromatography is very convenient. A thin even layer of the solid stationary (*e.g.*, silica or alumina) is deposited on a glass plate. The clue substance to be identified is processed as in paper chromatography. The results are quicker and more accurate. The stationary phase and the mobile phases can be varied at will. TLC is a method of choice for most of the preliminary investigations, purifications, and identifications of narcotics, drugs, and poisons. It is equally effective for other chemicals in small amounts.

1.7.5.3 Gas Liquid Chromatography (GLC)

Gas chromatography is one of the most important tools in forensic science. The technique is:

1. Highly specific; individualise the entity.
2. Highly sensitive; needs only minute quantities for analysis.
3. Highly fast; gives analysis results within minutes.

The technique is used in the analysis of gases, liquids, vaporisable solids, and for such substances which on heating pyrolyse to give identifiable volatile products. The materials analysed include petroleum products, liquors, perfumes, lacquers, varnishes, paints, barbiturates, soaps and organic insecticides, and many more.

The technique is simple in principle and practice. In general, a liquid or a solid stationary phase supported on small chips or other similar material is packed in the column or some material coated on the inner surface of the column. The column is kept in an oven, maintained at a required temperature; or the temperature is increased progressively to the predetermined final temperature. A variety of the materials are used for the stationary and mobile phase depending upon the nature of the sample being analysed. The length and diameter of columns are also varied for better results. Capillary columns are also used with advantage.

The material to be processed (for purification/identification/estimation or for separation of mixtures) is passed through the column with the help of a carrier gas like Nitrogen,

Helium, Argon, or Hydrogen. The sample in its passage through the column is fractionated. Different constituents come out of the column at different intervals and pass through the detector.

A large variety of detectors, with varying degrees of sensitivities, is available. Some of them are sample specific. They are detected by changes in the current of a circuit fitted therein. A recorder records these changes on a graph paper. Comparison of the graph with similar graphs of known products permits the identification and estimation of the constituents.

If the out-coming gases or vapours are collected in fractions at intervals indicated by the peaks and troughs of the graph, the separation of constituents is obtained.

1.7.5.4 High Performance Liquid Chromatography (HPLC)

The principles on which the HPLC functions are the same as in the case of GLC. The basic difference is that the mobile phase in this case is liquid, a solvent. The solution of the sample is passed through the column under pressure. Adsorption and elution of the constituents take place at different rates (differentially). The separated constituents are detected/collected at the end of the column.

1.7.5.5 GC-MS/LC-MS

In modern analytical techniques, GLC and HPLC combos with Mass Spectrometer have emerged as highly potent analytical tools. The GLC/HPLC separated constituents are subjected to mass spectrometric analysis. Graphic traces obtained give identities/quantities of the constituents.

These instruments are computer-controlled and programmed to give both qualitative and quantitative analyses. The work of the analyst is thus, greatly facilitated. Most of the Forensic Science Laboratories in India use the combos with excellent results.

1.7.6 Electrophoresis

The technique is particularly useful for colloidal or other materials like proteins, inks, paints, and pigments having a residual charge on the molecules. The technique is used extensively in the study of blood and other proteins.

The material to be analysed is taken on a paper strip (or gel). The two ends of the strip are dipped in an appropriate buffer solution. An electric current of appropriate voltage is applied to the strip. The charged molecules move in either direction depending upon their residual charge. The speeds of the molecules vary with the charge and the weight of the molecules and the absorption power of the medium. Thus, different molecules get separated into bands. The position of a band on the strip identifies the molecule.

Electrophoresis is used in DNA profiling. The DNA molecules are fragmented, which are subjected to electrophoresis and the patterns (profiles) of the fragments are obtained. The comparison of the profiles with the standard (known) profiles from the authentic suspected sources are compared to find the common source or otherwise.

1.7.7 Spectrography

Spectrography is the oldest modern technique used in the analysis of clue materials. Its use is limited to elemental analysis of some elements and their compounds.

A flame, an arc, or a spark vaporises a small amount of the materials. The light emitted is passed through a diffraction grating or a glass/quartz prism. They split the light into its various wavelengths. A photograph of split-up light is taken and studied. The position and number of lines depend upon the nature of the substance giving the light. Comparison with standard spectrograms (photographs of the spectrum) gives the nature of the constituents of the sample analysed.

The quantitative estimates are made by studying the densities of the various lines.

1.7.8 Laser Microprobe

A comparatively recent innovation of the spectrographic technique is laser spectrography. A small narrow beam of intense light (laser beam) is used to vaporise the material. The wavelengths of the light so produced are studied in the usual way.

The technique has not been extensively used in forensic work so far. But it has potential as the sample required is small. A small spot from the object is vaporised. There is no noticeable damage to the object. The analysis is "non-destructive" for all practical purposes. The technique is being utilised to "fingerprint" valuable paintings, statues, ancient items of national heritage, and other works of art.

1.7.9 Mass Spectrometry

Mass spectrometry permits identifications of all substances that can be vaporised into charged particles (most of the materials). The samples required for the analysis are virtually in the molecular (or atomic) range.

The technology permits both qualitative and quantitative estimation. The technique has an extensive use in forensic work.

Mass Spectrography, because of its extremely high sensitivity and versatility, has become a technique of choice especially for highly complex materials and substances in minute quantities like designer drugs. It helps to identify an "Unknown" substance through various fragments, which are formed in the process.

1.7.10 Spectrophotometry

One of the most important techniques in forensic work is spectrophotometry. It is sensitive, specific, and rapid. In addition, it is versatile and useful for both qualitative and quantitative analysis. It is simple in principle. The equipment is, however, sophisticated and costly. A beam of electromagnetic rays of selected wavelengths (from ultraviolet, visible, or infrared range) is passed through the material. The material absorbs some of the energy of the rays from particular wavelengths. The residual rays fall upon a photoelectric cell and produce changes in the current of the circuit. The changes are recorded on a graph paper. The comparison of the graphs with those of the known materials permits identification of the unknown material. Quantitative estimation is possible from the peak area.

The technique is extensively used in the identification of sedatives, drugs, poisons, narcotics, and intoxicants. It is also useful in the identification of liquids and gases.

UV, IR, NIR, and FTIR Spectrophotometers form part of the well-equipped laboratories.

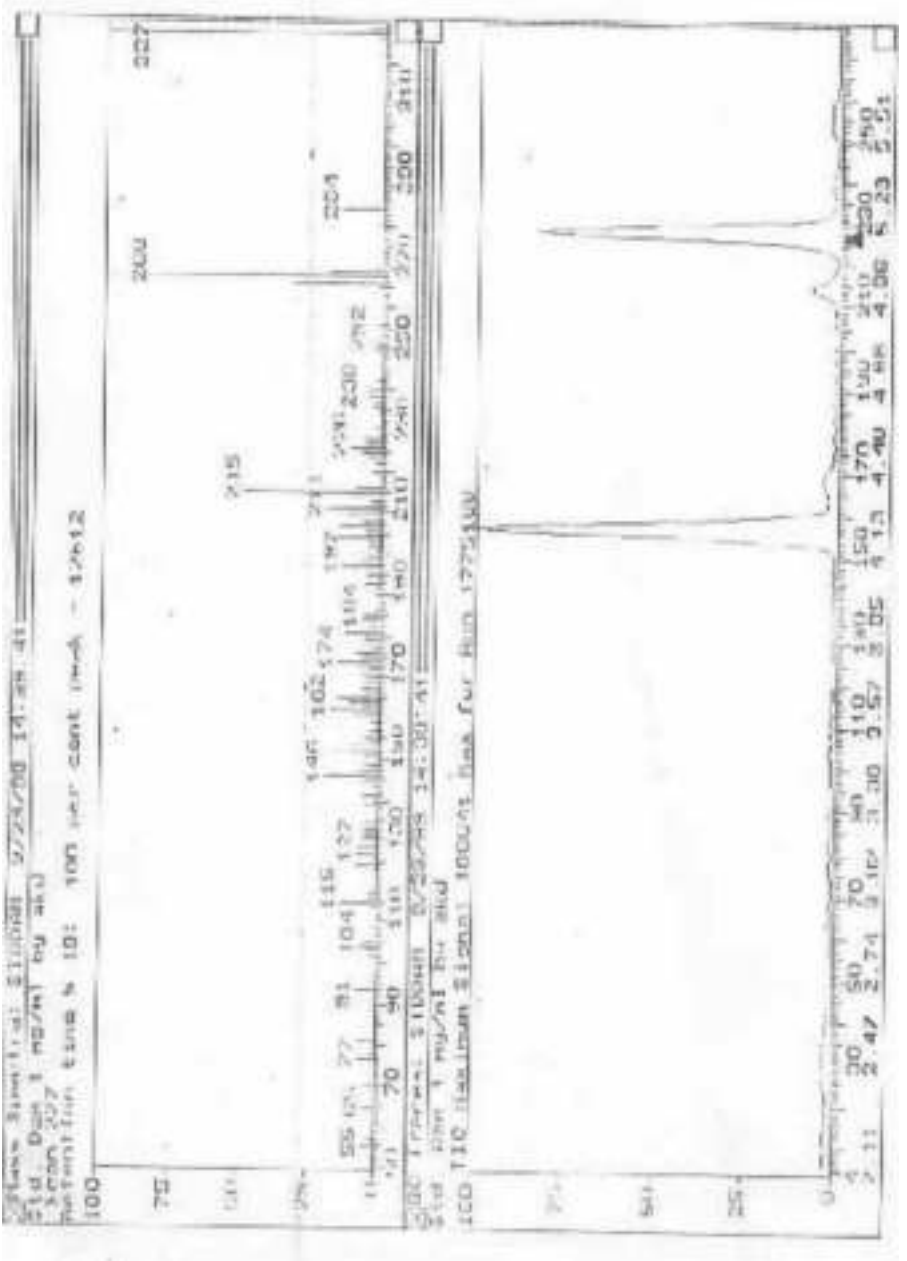

Fig. 1.9
Mass spectrum of heroin

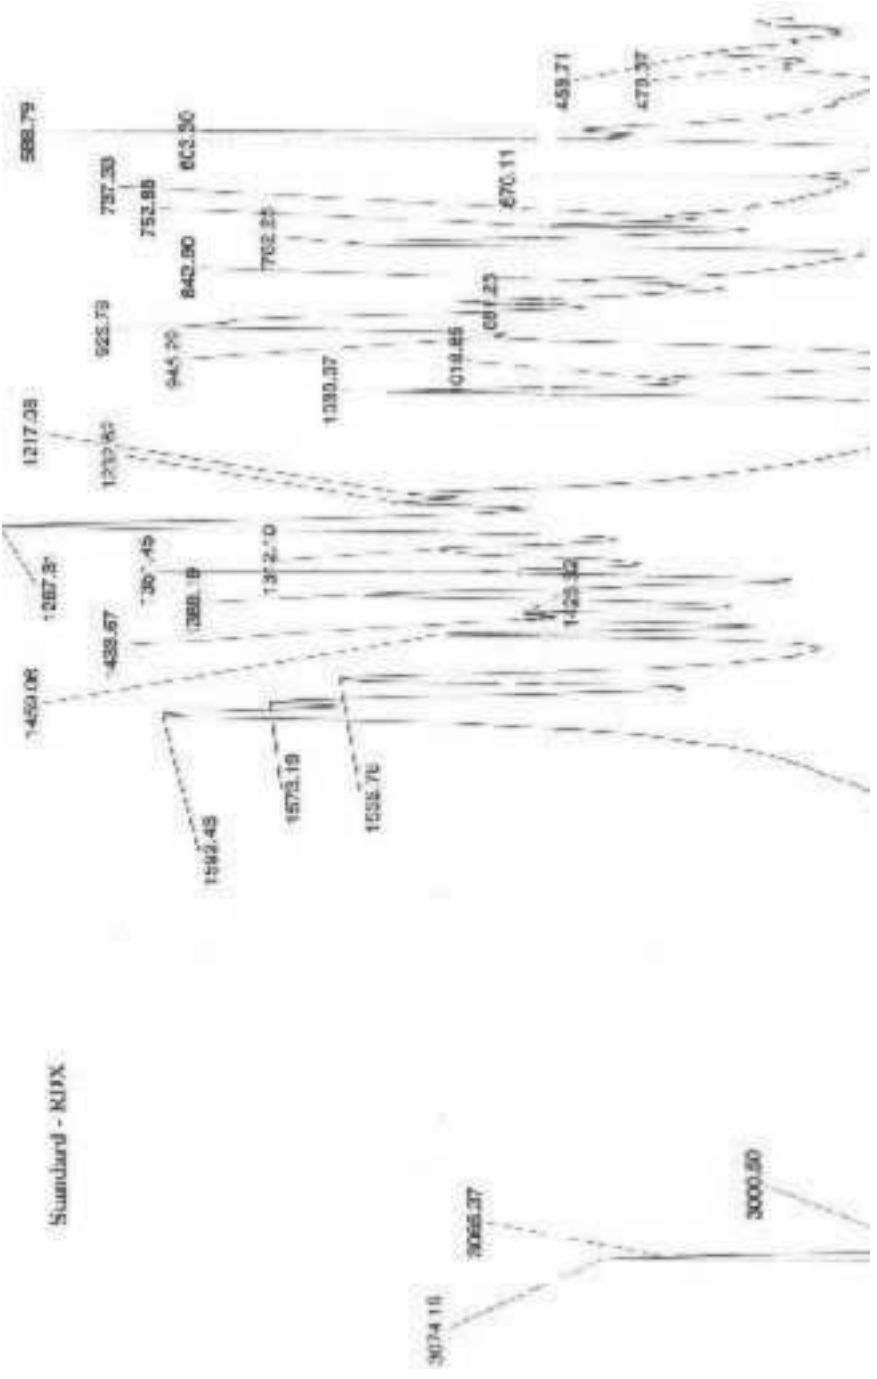

Fig. 1.10
IR spectrum of RDX

1.7.11 Neutron Activation Analysis

Most of the elements can be made radioactive. The radioactivity is characteristic of the element and is studied by spectrometry. The substance is placed in an atomic reactor where it is subjected to high flux neutron bombardment. Neutron sources other than atomic reactors are also known. But they are not so efficient in forensic work.

The technique is one of the most sensitive and specific techniques so far known. It has been utilised in the examination of projectile materials, hair, plant, soils, dust, and other clue materials.

The neutron activation analysis has not become a routine technique nor is it likely to become, it needs high flux neutrons which, in turn, need an atomic reactor. It is a complex and costly gadget.

1.7.12 X-rays Diffraction Analysis

It is a highly sensitive and specific non-destructive technique for the identification of materials. A beam of X-rays is passed through the material. The X-rays are diffracted. The diffraction pattern depends upon the arrangement of the various constituents of the crystal. The patterns of the suspect material are photographed. It is compared with diffraction patterns of known materials to establish identity/non-identity of the substance.

The instrument is usually coupled with a computer, which can store and compare the data so generated and give the identity or common source of the origin of the material.

The technique is useful in the study of barbiturates, glass fragments, minerals, inorganic substances, paints, pigments, corrosion material, dust, and the like.

1.7.13 DTA, NMR, and Polarography

Differential Thermal Analysis (DTA), Nuclear Magnetic Resonance (NMR), and Polarography techniques are important analytical techniques used in chemical analysis. They are being adopted for forensic work. All these techniques are sensitive and specific.

1.7.14 Scanning Electron Microscopy (SEM)

Scanning Electron Microscope is another powerful tool in the hands of forensic scientists. The surfaces is scanned by an electron beam for "observation". Part of the electron beam is absorbed, part is scattered, and part is reflected back.

SEM has the following advantages over optical microscopy:

- SEM gives very high resolution, which highlights even the small differences in surface structure. The resolution approaches the molecular level. Thus, it increases the discrimination power tremendously.
- SEM gives very high magnification (> 30000 X, even more).
- SEM provides images with three-dimensional effect.
- SEM with EDX (an additional gadget) identifies the elemental compositions of the surface or the particles thereon.
- SEM, coupled with computers, has facilitated the evaluation of the GSR (gunshot residues). The instrument provides better evaluations of the surface structures and marks on the fired ammunition.

1.8 FORENSIC SCIENCE INSTITUTIONS

1.8.1 Forensic Science Laboratory

A forensic science laboratory is the main forensic science institution for assisting the Criminal justice system in the dissemination of real justice. It has generally the following scientific departments (divisions):

1. Forensic Chemistry
2. Forensic Physics
3. Forensic Biology
4. Forensic Ballistics
5. Explosives
6. Forensic Toxicology
7. Narcotics
8. Forensic Serology
9. DNA Profiling
10. Forensic Psychology
11. Lie Detector Unit
12. Voice Analysis
13. Photography
14. Instruments
15. Computers/Cybercrimes
16. Scene of Crime

Additional divisions are coming up as per need of the area the laboratory is serving.

Deputy Directors, having a master's degree in their basic specialities, ordinarily head the divisions. They have several years of experience in the expertise and have ample research experience in the specific and related fields. Assistant directors, senior and junior scientific officers, senior and junior scientific assistants, and laboratory assistants and attendants, assist the head of the division.

The non-technical staff carries out clerical work, maintenance of stores and supplies and other non-scientific duties.

The laboratory is guarded against theft and loss of exhibits.

A director who has scientific training and has several years of experience of working in a forensic science laboratory heads the laboratory. In some laboratories, additional/joint directors (technical) and an administrative officer (non-technical) assist the director.

The laboratories, in India, by and large, are well-equipped. They have both the classical and modern equipments. Most of them are using the techniques mentioned above. Sophisticated equipment for techniques like comparison microscopy, spectrography, spectrophotometry, atomic absorption spectrometry, all type of chromatography, electrophoresis, mass spectrography, laser techniques, X-ray diffraction analysis, nuclear magnetic resonance, high performance liquid chromatography, and polarography is increasingly being used in the analysis of the evidentiary clues.

1.8.1.1 Services

The efficiency of a scientist is greatly affected by the services at his disposal. He should have ample working space: search table, chemical benches, lighting arrangement, and regular supply of water, gas, and electricity.

There should be adequate storage space for incoming and outgoing exhibits. They are kept in separate rooms. Each police district is given a separate storage rack so that the exhibits do not get misplaced or intermixed.

The storekeeper for the exhibits handles only sealed packets of the exhibits.

A small workshop greatly adds to the efficiency of the worker, as a slight modification to the equipment and apparatus can be made conveniently in the workshop.

1.8.1.2 Library

It is not possible to subscribe to all the important journals in various scientific disciplines. This deficiency is overcome by locating the laboratory near a university. Here in addition to library and laboratory facilities, consultations with university staff are also possible.

Forensic science literature has been developing during the past few decades. Most of the countries publish one or two journals exclusively dealing with the subject. They should be subscribed for the journals that carry papers on forensic science.

There are not many books on the subject. Therefore, all required books should be available in the library. The bibliography given after the chapters indicate most of the books in the English language. In addition, reference works in chemistry, toxicology, physics, and biology prove useful. They should be purchased.

1.8.1.3 Internet

Modern Internet as source of literature has become indispensable. It may ultimately replace libraries in the usual sense. The literature in digital mode is located at a central place and can be shared through the internet. Most of the literature is now becoming increasingly available internationally through this mode. An E-library of forensic literature at the central level is need of the time. It should be accessible to all the forensic institutions in India.

1.8.1.4 Functions

The main function of a forensic science laboratory is the examination of clue materials involved in crimes. In addition, the laboratories help in the photography and examination of the scene of occurrence, gives lectures, and demonstration to police trainees, prosecutors and judges. The laboratories carry out research in forensic science.

The experts appear in courts whenever required to explain and prove their findings. Section 293 of Cr PC, 1973, has reduced the court attendances tremendously as the reports of the experts are admissible as evidence.

1.8.2 Other Institutions

In addition to forensic science laboratories, the following institutions provide scientific assistance to the criminal justice system in the delivery of real justice:

1.8.2.1 Fingerprint Bureau

All the major States in India have fingerprint bureaus. In addition, the Central Government also has a Central Finger Print Bureau located at Delhi under the Department of National Crime Record Bureau. The fingerprint records at the national level have been digitised and computerised. Any police force in India can utilise its services.

Fingerprint bureau experts perform many functions, including the following:

1. Collect, classify, and store the fingerprint record of the criminals.
2. Eliminate the record of the dead persons.
3. Search the fingerprints records of a given person for his correct identity.
4. Compare the disputed and specimen fingerprints.
5. Visit the crime scene to locate; collect and ultimately compare the fingerprint found at the scene.
6. Give evidence in courts (or on commission) whenever required.

1.8.2.2 Government Examiners of Documents

Some State Governments and some central departments have experts (Government Examiners of Documents) to examine disputed documents exclusively. For example, MHA, Government of India, had three such institutions, known as Government Examiner of Questioned Documents. The oldest one was located at Shimla (partly shifted to Chandigarh and likely to be located finally there). It started functioning somewhere around in 1906. The other two institutions are at Kolkata and Hyderabad. These institutions cater to the zonal needs of not only Central Government departments but also to the State Governments' needs. They have since been merged in the Central Forensic Laboratories at those places.

Some states have named their own document examining institutions as Document Bureaus. Most of the states have established document examination departments in their Forensic Science Laboratories.

1.8.2.3 CID Scientific Sections

Some police forces have scientific divisions in their CID departments, which help the department with technical photography, scientific surveillance, and cater for other technical needs.

1.8.2.4 Computer Divisions

There is hardly any police organisation now that does not have a computer division. The use of computers by police forces in India is yet limited. However, it is growing fast.

1.8.2.5 Chemical Examiners' Laboratories

The institution of Chemical Examiners' laboratories was the first step towards a scientific criminal investigation. The first Chemical Examiner's Laboratory was established in Chennai in 1849. Later the laboratories came up in all the major states (provinces). The main functions of these laboratories were:

- To ascertain poisoning, to identify the poison, to determine the quantity administered if the person had died of poisoning.
- To identify biological stains of all types but mainly blood and semen stains.
- Some Chemical Examiners' laboratories also examined liquors, narcotics, drugs, and food particles.

These exhibits, in many states, are examined by Public Analysts laboratories.

Today, the chemical examiners' laboratories, in most of the states, form part of the Forensic Science Laboratories. In some states, they continue to exist separately; where they perform mainly the first two functions, mentioned above. The analysis relating to liquor and narcotics are carried out by other specified laboratories often under the control of excise department or Narcotic Control Bureau.

1.8.2.6 Department of Explosives

The department of explosives is also a legacy of the 19th century. An Inspectorate of explosives was established in **1898**, at Nagpur. Additional units have since come up almost in all the important cities of India including Metropolitan cities. The Inspectorates of explosives used to handle explosives and explosions in criminal investigations and help mainly:

- To collect evidence from the scene of explosion;
- To identify the explosive(s) and explosive device(s) used in the explosion;
- To collect, identify, and inactivate the live explosive devices; and
- To provide guidelines for further investigations.

However, the department of explosives no longer assists the investigators. This work is gradually being taken over by the Forensic Science Laboratories. Additional help, especially in the disposal of live devices is being provided by:

- The bomb disposal squads of armed forces.
- National Security Guards. They also train the police to handle explosives and explosions.
- Bomb Disposal Squad, Delhi police.
- Bomb handling squads of some para-military forces.

1.8.2.7 Serologist to the Government of India

The Serologist to the Government of India was established in 1910 for the first time. It examined biological stains, particularly blood and semen stains. It thus, provided valuable assistance in a scientific criminal investigation for about 50 years in India. The institution still continues with diminished utility as almost all the Forensic Science Laboratories have their own serology division where the same work is being done perhaps with greater efficiency. Besides, the advent of DNA profiling has limited the utility of other serological tests. Most of the Forensic Science Laboratories have now DNA profiling facilities. Others are in the process of inducting expertise. No laboratory, worth the name, can afford to remain without the facility. Soon it will be available in all the forensic science laboratories.

1.8.2.8 Mobile Laboratories

Most of the States have mobile forensic science units to assist the police in the examination of the crime scene. They vary in number, staff, structure, and in the administrative control. The unit usually has a forensic scientist, a fingerprint expert, and a photographer. The mobile laboratories, at the scene of the crime, assist to:

- Ascertain the genuine or fake nature of the scene.
- Photograph the scene.

  Handle the physical evidence: help to locate, collect, and preserve the incriminating and sample evidentiary clues.

- Provide leads for further investigation, after preliminary evaluation of the evidence and the scene.
- Reconstruct the occurrence and the sequence of event: route of ingress, route of egress, and the number of participants.
- Indicate the nature of occurrence: murder, suicide, or accident.
- Evaluate the accident to determine the cause of the accident and the possible perpetrator.

The number of mobile laboratories in India is too small. There are about 800 districts. It is essential that there should be mobile units in all districts and in all big cities for better scientific criminal investigations.

1.8.2.9 University Departments

Specialists in various universities are highly qualified persons in their specialities. If some analytical work falling in their speciality is referred to them they carry out the analysis competently. The departments of anthropology, chemical technology, and psychology have been utilised in the past. The reference is usually made only when the required expertise or the equipment is not available in the departmental laboratory itself.

The teaching of Forensic Science[5] in the universities has been gathering momentum in the past few decades. Some of the teachers there offer their services on *pro-rata* fee basis, which is shared by the specialist and the university.

Most of these universities can provide expertise of the high order.

1.8.2.10 Medico-legal Institutes

The following institutions provided Medico-legal assistance in India:

- Medico-legal Institutes like the one at Bhopal.
- Medical Colleges; most of the medical colleges especially government medical colleges, have Forensic Medicine Departments. These colleges provide medico-legal expertise.
- Medical Research and referral institutions like All India Medical Institute of Medical Sciences at Delhi, and Postgraduate Institute at Chandigarh have Forensic Departments. They provide expertise.
- The offices of the Police Surgeons.
- Some Forensic Science Laboratories have also opened Medico-legal divisions.

Medico-legal assistance in scientific criminal investigations plays an important role. Post-mortem or medico-legal examination reveals:

- *corpus delicti*;
- nature of death (Suicide? Accident? Murder?);
- cause of death;
- time of death;
- nature and number of injuries, fake or otherwise, grievous or otherwise;

5. LNJPN, National Institute of Criminology and Forensic Science, Delhi has also started M. Sc. Course in Forensic Science.

- nature and the number of the weapon(s) used, and hence, indirectly the number of armed assailants;
- the presence or indication of other crimes (rape, sodomy) along with murder;
- personal identification data (sex, age, height, built, deformity, scars, tattoos, old bone injuries and disease,).

Elementary medico-legal assistance is available in all hospitals. Higher order of medico-legal expertise is available in the institutes mentioned above.

The medico-legal assistance is extremely poor in most of the states in India. The work is entrusted to the junior–most doctor who often makes a mess of the evidence. In some places, the authorities have improved the system. In serious cases, a team of doctors undertakes the work.

1.8.2.11 Private Consultancies

Private individuals and agencies are coming up in our country, increasingly, to provide scientific assistance to the needy in scientific criminal investigations. They are proving to be quite useful. However, yet the consultancy service is limited, with limited investments; though the expertise of very high order is available from the retired government experts. It is hoped that the situation changes for the better in the coming times as the demand and the paying capacity of the public improves.

Fig. 1.11
Private Forensic Detective

1.8.3 Quality Assurance

The fate of the accused persons often depends upon the findings of Forensic Scientist. It has to be ensured that he does not intentionally, negligently, or otherwise give wrong results. The following steps help to prevent his failure:

1. Quality Assurance: the processes, tools, and output of the expertise are well-established standards.
2. Accreditation of the Laboratory and the Experts is done.
3. Standardisation of the tools and techniques is appraised periodically.
4. The quantum of evidence, for proof, is fixed for each type of evidence.
5. Wherever possible automation is inducted in the examination of the evidence, to reduce the human error, and to increase the overall efficiency of the forensic work.
6. Periodic blind tests to ascertain that the expert, the equipment, and the procedures are properly functioning and carried out.

All the steps are essential to streamline the working of forensic science service. They are being adopted in India. However, the speed is slow.

Fig. 1.12
Sherlock Holmes at work

1.9 ADDITIONAL READINGS[6]

1. *Wiley Encyclopedia of Forensic Science,* Allan Jamieson and Andre Moenssens Editors-in-chief, John Wiley & Sons, Inc., 2016 (5 vol set)
2. *Encyclopedia of Forensic Sciences,* Seigel, J. *et al*. Editor in Chief, Elsevier, USA, 2011 (3 vol set).

6. The readings are mainly Forensic scientist's/researcher's fare.

APPENDIX A

ETHICS IN FORENSIC SCIENCE

1. Introduction

1. Ethics, literally speaking is the branch of philosophy concerned with human character and conduct and behaviour. It is the science of morals. Hence, ethics in Forensic Science is concerned with character, conduct, and morals of the Forensic Scientist *vis-a-vis* his work in the field, in his laboratory, in his office, in courts, towards his fellow professionals, suspects, investigators, lawyers, judges and towards the public at large.

2. The importance of the evidence tendered by Forensic Scientists cannot be over-emphasised. The lives and liberties of persons depend upon their findings. On the one hand, the innocent accused loses his life and liberty, on the other, a criminal may be let loose, endangering the lives and liberties of many more. I was once tendering evidence in a court of law against a criminal who had been tried earlier eleven times, for murders. This time, he had murdered his own father. Consider the following situations:

- If a bullet, recovered from the dead body of the victim, is identified in respect of a firearm recovered from a suspect, it links the firearm positively with the killing.
- In a case of rape-murder, if the semen stain is identified to be that of the suspect *via* a DNA profile, the identity of the rapist-murderer is established beyond reasonable doubts.
- Fingerprints in blood found on the door of the murder room, helps in identifying the murderer.

3. If this type of important evidence is allowed to be mangled and mauled by unethical practices, it shall be most unfortunate. Some kaleidoscopic patterns:

a. *In a case of dacoity-cum-murder in a bank, an individual was apprehended. He was "identified" by the bank officials in police identification parades. However, the clinching piece of evidence was a fingerprint allegedly lifted from the cash counter by the police. It was clinching because the accused also produced eyewitnesses who testified that the accused was serving them eats at about 50 kilometres away at the material time. The expert, however, identified that the lift bore the fingerprint from the left index finger of the accused. He was convicted for 40 years imprisonment.*

The accused/convict maintained throughout that he was not the culprit, but to no avail. He went in appeal but before going to the court, he engaged an expert to check the evidence of fingerprints. The findings of the expert were startling:

- *The lift was not in the departmental fingerprint powders. Instead, it was in 'ink', used in electrostatic (Xerox) machines.*
- *This size of the fingerprint on the lift was appreciably smaller than the specimen fingerprint size – indicating the former was probably taken when he was a boy.*
- *On investigation, it was found that the police had taken his fingerprint when he was a boy (about 20 years earlier). The print on police record tallied with the print on the lift, dimensionally, also.*

The court not only dismissed the case, and ordered suitable compensation to the accused/convict but also severely criticised the unethical behaviour of the investigating agency

including that of the fingerprints experts and ordered suitable action against the police-culprit(s).

b. *An established handwriting expert appeared, via special power-of-attorney, in the Punjab and Haryana High Court to cross-examine another handwriting expert, appearing on the opposite side, in an election petition case. The latter expert had identified the authorship of the signatures allegedly on a libellous letter by the client of the former expert. The letter could nullify the election of the legislator. The defending expert was sure, it appeared, about the correctness of the authorship findings of the opposing expert, so he did not appear as an expert to oppose the findings. However, to create doubts in the findings, he adopted a novel technique: There were dimensional differences in the questioned and specimen signatures. The defending expert would pick up each letter, point out the dimensional difference and ask if the other would admit the difference or not. As the dimensional differences existed, the latter had to agree. Thus, he picked up each letter, formation, etc., dramatically and went on until he covered all letters, formations, etc. In the end he asked:*

   "*You have admitted there are differences in all letters, formations of the signatures, would you not like to change your earlier opinion?"*

   With the novel technique, the expert tried to paint the right findings with a thick layer of doubts, to obscure the truth for the 'benefit' of the court! He did not tell any untruths, by giving false evidence by taking the witness stand.

   Ethical? Unethical??

c. *In a case of murder, the police sent a 12 bore cartridge case and a shotgun, the former allegedly taken from the scene and the latter from the suspect. The cartridge was found to have been fired from the alleged shotgun. The doctor had recovered a cushion wad (used in 12 bore cartridges) from the deceased at the time of post-mortem. The expert (who had established the gun-cartridge linkage) was asked if the cushion wad, was fired from the gun, at the time of giving evidence. It could be. So far so good. The snag lay in the fact that the cushion wad did not belong to the cartridge under reference. The expert realized the factum. However, neither he was asked nor he informed!*

   The "Truth"? yes!

   The "whole truth"? No!!

   Ethical/Unethical? Certainly unethical??

2. Tenets of Ethics

The main tenets of ethics in Forensic Science include:

1. The expert must be an honest and dedicated man of science, without any bias/sympathy to any of the parties involved
2. The scientist is qualified.
3. He must possess the necessary technology.
4. He bases his evidence upon properly generated empirical data. It does not emanate from his institution/hunch/conformational syndrome. The data meets the standards fixed by the professional body.
5. He is aware and has studied the contradictory (to his thesis) evidence/data and has accounted for it.

6. He is prompt in his answers. He admits ignorance of something he does not know.
7. He must tell the whole truth.
8. He must not succumb to pressure.
9. He must remain a man of science. He has no friends to save, no enemies to avenge
10. He should not only be honest but also look honest.

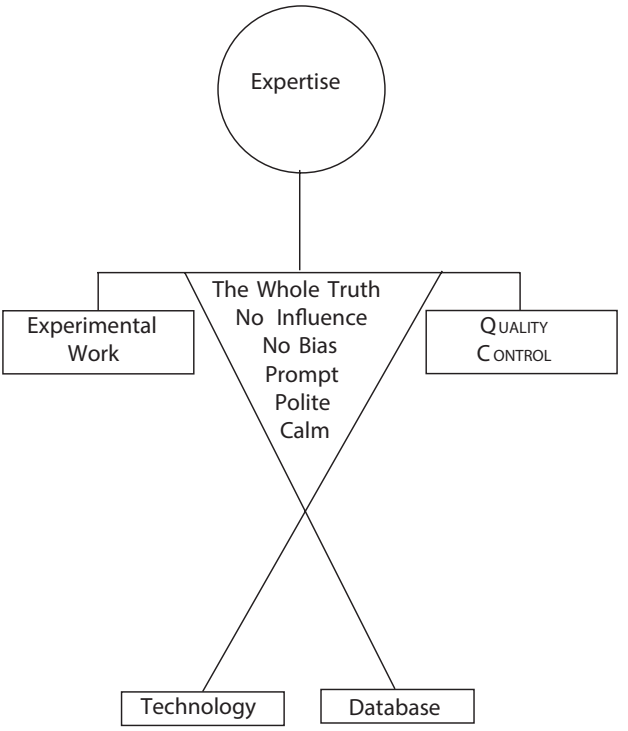

Fig. 1.13
Ethics in Forensics*

2.1 Qualified

Forensic Science is a highly specialized science, divided into a number of specialities. The person professing expertise in any branch must have the basic groundings:

- Basic education in science
- Training in the speciality
- Research in the same or related field
- Publications
- Participation in professional meetings/Seminars/Workshops
- Experience in the involved field
- Certification

Unfortunately, in our country (as elsewhere) some persons pose as experts without possessing adequate expertise. Yet with the felicity of tongue and easy conscience, they dispense cashable fake expertise and make an extra penny on garbled knowledge without having sound groundings. I know of:

- Fingerprint experts who have jumped into the bandwagon of handwriting experts.
- Toxicologists who profess expertise in Ballistics.
- Administrative officers in connected Forensic Science laboratories who practice everything scientific they heard of, in the laboratory.
- Police photographers, who, become handwriting experts/fingerprint/footprint/tool marks, etc.

All unethical, by all standards, I suppose!

In certain countries, there is a system of certification of experts by professional bodies. If the person has qualified the certification test, which is of an adequate standard, the person is properly qualified. In India, we have not introduced the system so far, we should.

2.2 Modern Technology

Practice in Forensic Science, these days, involve hi-tech, sophisticated gadgetry and shifting technologies. The technology is so costly that an ordinary citizen singly cannot possess the same. It is available in governmental institutions or other institutions organised by non-governmental or semi-governmental organisations.

Check points for adequate technology:

- Equipment
- Library — Literature, Internet
- Adequate consultancy — more than one experts
- Innovation/research facilities
- Database

The days of experts hoodwinking courts by their: "Colour-Corrected, auto-illuminated, forgery detection device", a name given to the simple magnifying lens (with light) should be over.

If a person is practising expertise without adequate equipment, he is debasing science. He has no means to generate the needed data. He depends upon his facile tongue and labile conscience. His depositions should not be relied upon.

Is he, or is he not unethical?

2.3 Database

All findings in Forensic Science are identifications of individuals, of materials, of patterns, of places, of situations. All identifications are based upon adequate data, generated by the experiments, observations, and evaluations of circumstances of the given evidence. This data has to be compared with the standard data already generated and stored (database). In some cases, it is generated with known standard samples as well as with blank experiments. The determination of the adequacy of generated data is based upon the experience of the expert and of other workers in the field. Sometimes professional bodies fix such norms.

Has the expert come up with the generated data? Does his data compare well with the data generated from the standards? Or, does his data compare well with prescribed laid down standards?

If the expert is not following the normal norms for evidential data, he is perhaps unethical!

Remember: 'From known (standards) to unknown (questioned entity)'!

2.4 Promptitude

The law has laid time limits for putting up challans in certain types of criminal cases. For example, under the PFA Act, 1955, as modified from time to time, the limit is 40 days. Under Cr. P.C., 1973 this time limit is 90 days. If the expert's report is sent after the prescribed limits; its value is lost. The criminal may get the benefit. "Justice delayed is justice denied".

I know of an officer who would send his reports relating to food analysis only technically before 40 days. Postal delays, office delays would often allow crossing of the limit. The cases would, thus, fall through in the courts.

Delays in Forensic Science are highly deplorable. The delays should be dispensed with. When the staff/work ratio is critical, it is better to refuse cases. — Send them to Central or other Forensic Science Institutes, — rather than accept them and keep them pending for months and years together. Some years ago, I visited a laboratory. Its Toxicology division had crateful of exhibits pending examination. Enquiries from the Director revealed that all the exhibits would need at least 10 years to clear the backlog alone with the present staff, provided. No more exhibits come came (which was impossible). How did he deal with them? He told that he would get examined only those cases in which courts passed orders for examination. The others would die their natural deaths (— cases decided!) exhibits putrefied!

Intentional delay is of course unethical. Is the delay due to heavy workload ethical/unethical; a moot question?

2.5 The Whole Truth

An expert witness, giving evidence in a court is required to take the oath:

> **I solemnly affirm (swear by ……..) that I shall tell the truth, the whole truth and nothing but the truth, so help me …….(God).**

In the initial stages of appearances in the court, the wording perhaps impresses the expert. But with the passage of time, he loses the importance of the word and the recital becomes just a necessary ritual — just like the recital of qualifications, experience, etc. However, the words of the oath are important. It requires of the expert to give "the whole truth and nothing but the Truth". What is "the whole truth"?

Consider the following cases:

a. *In a case of forgery, the disputed signatures, though obtained by trickery, were of the alleged person. Correct identification of the author would have exonerated the forger. There was insufficient other evidence to link him with the forgery. The expert was examined the case erroneously found that the evidence was not sufficient to identify the real author. His evidence thus went against the manipulator. The head of the department winked at the findings, though convinced otherwise!*

   Unethical?

b. *In a case of money transaction, the alleged borrower denied receiving any money or signing the document, promissory note (pronote). The court sent the document to the expert. The signatures of the borrower on the document did not tally with the signatures obtained as*

specimens. However, as a matter of routine the document was exposed to ultraviolet rays. Lo! The UV rays revealed chemically erased signature near the visible disputed signatures. The revealed signatures were of the borrower.

Sticking to the requested examination the author could not expose the fraud. Additional input, ultraviolet rays' examination revealed "the whole truth".

It appears that the court clerk had connived with the borrower in the fraud!

Ethical?

c. *In a case of attempted murder, the police sent one firearm and two fired cartridge cases to the laboratory. Examination revealed one cartridge had been fired from the firearm sent, the second shell was not.*

A week later, in another case, one firearm and two cartridge cases were received from the same police station. Again one cartridge was found fired from the sent firearm, the other was not. However, inter se check of the fired cartridges in the two cases, revealed that left out the cartridge in the first case was fired from the weapon received in the second case and vice versa. The reports were sent accordingly. The examination linked the two cases.

However the investigating officer came running, on receipt of the report. There was no link between the two cases. In fact, the firearm received in the first case was supposed to be in the laboratory when the second case occurred! He wanted to get the reports changed accordingly. He did not want "the whole truth!" The expert did not oblige the IO.

Ethical?

d. *In another case, two assailants who fired at the victim from close range allegedly killed the victim. There were three wounds on the deceased. According to the police two of them were entrance wounds and one was an exit wound. The post-mortem report did not discriminate between the entry and exit wounds. Were there really two entry wounds?*

Check on the shirt worn by the deceased in the courtroom revealed only one hole! It indicated one killer shot only—setting aside the police theory of two shots by two suspects. The court acquitted the accused!

Ethical?

e. *In an interesting case, a nephew shot dead his issueless moneyed uncle (father's brother) and aunt, while they were taking a stroll on their agricultural farm. He was sure that he would inherit the property after them.*

He was the prime suspect. He was tried for murder but the court acquitted him with epitaph—

"Insufficient evidence!"

Did he inherit the property? No. The law and the ballistics expert deprived of the fruits of crime, from the murder. The legal position is that in the case of the death of a spouse the survivor inherits the property of a couple. After the death of the survivor, the heirs of the survivor inherit it.

In this case, therefore it was essential to find out who was killed first.

The case was referred to the author. He studied the shotgun injuries on the deceased. The patterns of pellet spread, the site of the injuries and the range of fire indicated that the husband was fired at from a closer range. He died (killed) first. The lady was fired later and in all probability died later Thus the husband's property legally passed on to her (perhaps for a few seconds only), then to her legal heir(s), of course, different from the alleged murderer, who claimed the property.

"The Whole Truth" found by the expert from the evaluation of the injuries prevented the criminal from enjoying the fruits of crime.

Ethical? Of course!

The "whole truth" concept brings in real justice as it exposes the unethical machinations of the culprit and his co-manipulators. It prevents miscarriages of justice in trials.

It is ethical to find the 'whole truth' It is unethical bypass/ignore/suppress the 'whole truth'!

In short, the "whole-truth" sticklers have the following attributes:

1. He does not wink at the wrong action, real/implied/glossed over by others.
2. He does not promote/practise/accept half-truths.
3. He does make/accept 'honest mistakes'. The experts cannot afford to make mistakes. They must evolve processes, which must dispense with all possibilities of mistakes.— It should form part of the examination or evaluation system. It may be double or

triple self-check or repeat checks by subordinates, colleagues, superiors. In short, the results should be foolproof. The chances of 'Honest Mistakes' should be finished through periodic quality control checks. In expert evidence, there is 'no honest mistake'. It is outright negligence or bad intentions. Both are costly and criminal.

4. He sticks to the solemn oath: ….**"the truth, the whole truth and nothing but the truth"**: Truth for the presenting sides: truth for the defence, truth for the court; the whole truth: asked, or unasked, avoided or secreted, 'volunteered or objected to'.

   The whole truth must come forth as long as the courts permit/accept/give the opportunity to the forensic scientist.

2.6 Man of Science

A man of science is slightly different from other men. He does not depend upon conjectures, intuitions, inner voice, or a hunch, even if he has them. He may take them as possible, experiment upon them and collect evidence from these experiments. From the results, he draws inferences. He crosschecks them himself, gets them checked from his colleagues, subordinates and superiors and forms the final opinion from the total evidence. The evidence he presents, is data-based, open, visible, verifiable and could be evaluated and appreciated by all concerned given the necessary will and attention. It is objective (not subjective) evidence that he produces.

If it is a new field of investigation, he submits his experiments, observations and inferences to the scrutiny of fellow scientists in the same institution, in other institutions carrying out similar work, and in seminars, meetings and workshops. If his findings still stand the scrutiny after receiving repeated hammerings, it has passed the acid test.

The process was adopted, almost in its entirety, in the Biggar Murder case:

> *A girl was found murdered in the cemetery of a small town. The girl did not belong to the town and nobody had seen her alive in those parts. She had been strangulated to death manually. She had no evidence on her person or at the scene that could lead to the culprit except a bite mark on her breast. The police collected and preserved bite mark evidence (photographs, lifts).*
>
> *The investigation of the police led to the belief that one of the boys of the local college had committed the crime. There were 421 boys in the college at that time. Dental casts of all of them were obtained. Most of the students could be eliminated as suspect easily. Eleven dental casts were ultimately left for detailed examination. A team of dentists was constituted. The team identified the culprit.*
>
> *It was the first case of identity based solely on the 'bite marks' evidence. The evidence therefore, was submitted to other specialists of the country also. Nay, it was also sent to some renowned odontologists abroad.*
>
> *After massive consultations, the evidence was finalised and put up in the court. The court seeing the amount of work done and near unanimous findings of the specialists accepted the evidence and convicted the accused for murder on the sole evidence of bite mark.*

A man of science sticks to scientific process. He generates experimental data, he makes intensive observations, records the positive/negative data, determine the positive and negative odds and draws inference on the basis of preponderance of data. The man of science does not go beyond the dictates of data that he generated. He does not enter the realm of speculation. He does not extend or stretch the findings.

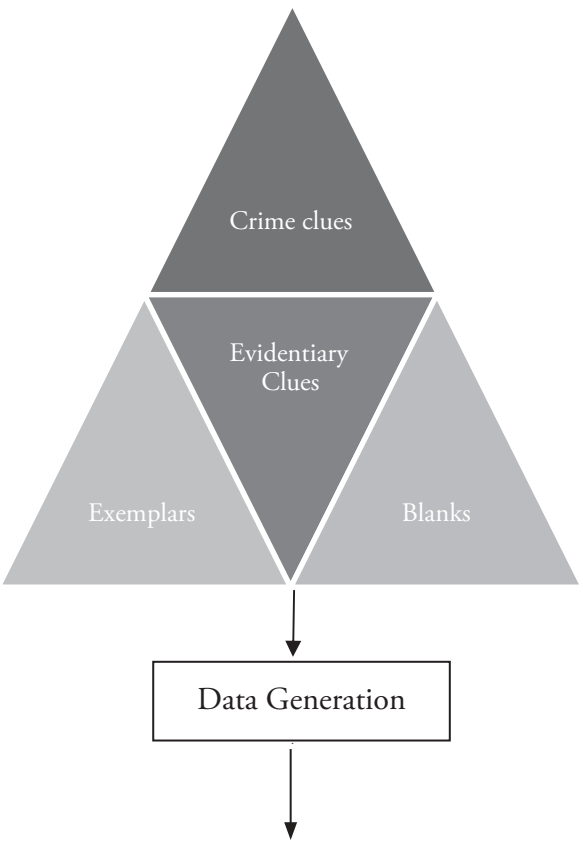
The man of science is a witness of science, not of individuals or parties. His finding may help one party or the other. Or, it may be just useless data from the court's point of view. The expert has to remain neutral, non-combatant, within the boundaries of generated data.

The man of science has no innocents to save, no culprits to punish. He is just to provide the information he has been able to generate from his examination of men, materials and situations.

In short, an ethical man of science:

1. Is steeped in scientific culture.
2. Is open to scrutiny/appraisal.
3. Is stickler to transparency/openness.
4. Has no friends, no foes, vis-à-vis his work.
5. Has no innocents to save, no culprits to punish.
6. Dives deep into the problem, to find the roots cause.
7. Sticks to scientific processes.
8. Generate adequate empirical data in support of his thesis.
9. Compares the generated data, with the standard data.
10. Bases his opinion on the quantum of required data.
11. Uses no dogmas, jargons no complex theories.
12. Appraises alternative possibilities/theories.
13. Collects data, both for and against the propositions.

2.7 Evidentiary Clues



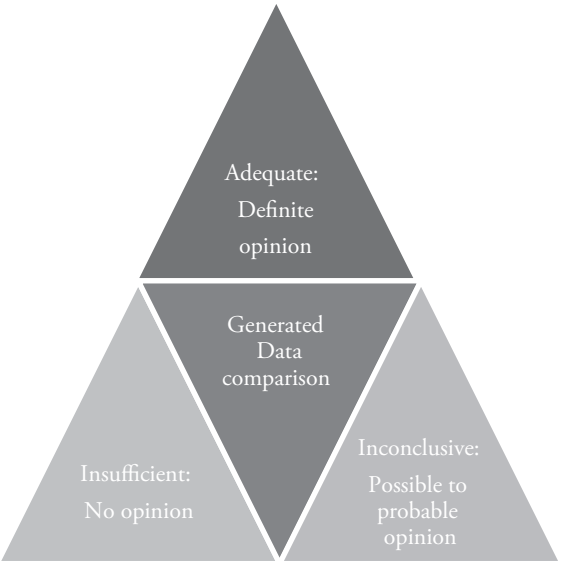


Fig. 1.14
Scientific process

2.8 Behaviour

The behaviour of Forensic Scientists in the court (and elsewhere) is important. The following aspects may be noticed.

1. Present day expert does not sit in the IVORY TOWERS. The general knowledge of the average man has gone up very high; thanks to governmental effort at universal education and also to the media (especially TV), they can understand most of the applications of Forensic Science — except perhaps the intricate instrumentation and details of the sophisticated techniques. The expert cannot get away with the plea that the evidence is technical and a non-expert cannot understand it. It is blasphemy, unethical misbehaviour!
2. The expert keeps his mental balance. Some defence counsels provoke the expert, to rattle him. They hope to get reports/answers that may not be completely correct. The expert must keep his cool even on provocation.
3. Sometimes the expert is asked to tender evidence in court. It is a bad practice. The court and the counsels lose the chance to know the evidence first hand and get clarifications of some parts of the evidence.
4. There is no prescribed court dress code for an expert in the court. However, the court does expect the expert to appear in a decent dress—the concept varies with places, times, customs and individuals. However, the formal dress prescribed by government for its employees should be used whenever possible.
5. Expert evidence is based upon experiments, observations and inferences. However, it is desirable to thrash them out with colleagues, subordinates, superiors,
6. Sometimes the defence counsel or the judge asks questions on some new facet of evidence when the expert is in the witness box. The correct answer may

need exploration, which in turn will need time for data generation, evaluation, comparison, The expert should not give half-cooked answer, which may not convey even half the truth. He requests the court to give him time to study/examine/evaluate the problem. The courts appreciate the intention and allow time.

Instant expertise demand is usually a defence counsel's trap to the expert. He should avoid it. Instant expertise can mislead at times. The demand is, therefore, unethical.

7. What should be the attitude of an ethical expert towards 'Yes'/ 'No' answers or towards hypothetical questions? Both are pitfalls and often mislead. Enlightened courts permit elaboration of the former and inhibit the latter. We must volunteer correct and full information with the permission of the court, even if a party objects to the explanation.
8. What should be the attitude of an ethical expert towards cases sent for a second opinion? This problem has been bother-some. Is it ethical to avoid the second examination? Or, is it ethical to take up? Perhaps, it is so. Refusal to examine the case is perhaps unethical.
9. Ethical behaviour of an expert, in the courts, includes:—
   - He is polite.
   - He stands by his findings. At the same time he is dogmatic.
   - He is respectful to the court/counsels. He does not ridicule their ignorance about the expertise.
   - He gives his best honestly, persuasively and in easily intelligible wording/illustrations/photographs, etc.
   - He answers the relevant question correctly, intelligibly and politely.
   - He does his best to promote real justice.

2.9 Bias

The scientific evidence has no place for bias. However, human beings handle the evidence. Every person has many infirmities, including-

1. Emotions: sympathy, anger
2. Likes and dislikes
3. Arbiter's feeling—the ego

It will be wrong to imagine that a person will be totally free from bias. However, a process is evolved where bias is controlled/reduced drastically. The following steps help:

- The background of the case is not intimated to the expert. If he does not know the history of the case, bias is eliminated in many cases.
- The involved parties are not allowed to meet the expert. The step prevents the development of bias. If he does not come in contact with the personalities involved, he does not develop sympathy/hostility towards their plight, accused/victim alike.
- He is an ethical man of science. If he 'plays the game', the bias is eliminated.
- Bias, theoretically speaking, is always present. But in real practice, it is minimal, especially when the expert work is streamlined and the examination is done by more than one expert.

- There is a danger of sub-conscious bias in the mind of the scientist. However, he strictly follows the scientific process, the sub-conscious bias stands eliminated.
- There is a mantra for the scientist to guard himself against subconscious bias. He may adopt it with advantage. The mantra is writing and recitation of the text:

"I have No bias. No friends to save. No enemies to punish.

Scientific data alone guides/controls my findings."

The scientist writes the mantra on opening the file and on closing the file. He recites the mantra every time when he handles the file.

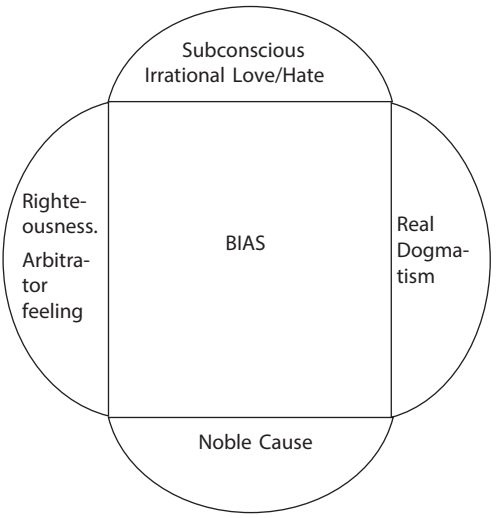

Fig. 1.15
Bias

2.10 Pressure—Influence?

Pressure, like bias, is ever present danger hanging like a sword of Damocles on the head of the expert. Politicians often try to influence directly, or indirectly. Some superior officers also try. Public—the involved persons, often try: Money, friendship, relationship threats are all used. If the scientist succumbs to the influence even once, he is sure to end up perhaps in a few cases a financial success but surely a mental and ethical wreck. Ethical men cannot bear the continued mental and emotional torture and end up in suicides, or contract serious physical, mental ailments.

When I was leaving university to join my job as Director CID Scientific Laboratory, in 1957, I went to the Head of the Department, a renowned Scientist, for his blessings. These blessings were unique. He said, Remember: Scientists in your new shoes commit suicide; Remember. He said no more, no less.

I related the same to my eldest brother. He reacted sharply and recited a couplet from Sheikh Sadi:

"*Kas Na Deedam Keh Gum Shud Uz Rahe Rast.*"

(I have not seen any person losing his way while following the right path)

Influence is against the truth. At times, resistance to influence becomes torturous and perhaps gives temporary career set back, but remember: "Even this shall pass away".

It is gratifying, perhaps, to know that those who can resist influence earn real respect from all concerned, even from those whose influence is resisted. I had personally been in conflict with two toughest Chief Ministers, who through their agents offered 'everything' for doctored reports. The resistance for the time being created fear for the 'consequences' but fortunately it passed off. Later rendezvous however, clearly indicated that my stand had earned respect and admiration from the individuals. Of course, I had to pay its price in the initial stages.

A lot of water has since flowed under the bridge. In these days of changing politics and frequently changing politicians with questionable moral and ethical background, in some cases at the helm of the affair and rampant corruption, it is practical to avoid taking sides. Next change of politicians may bring in wrath for the favours rendered to the outgoing ones. And you may be the scapegoat. In the prevailing circumstances perhaps; it is best not to bask in the anterooms of the powers that be, but be confined to the walls of the laboratories in anonymity. It is difficult; yet, a must for the ethical man.

In short, in not succumbing to influence, avoid it through:

1. Tact
2. Politeness
3. Firmness
4. Anonymity

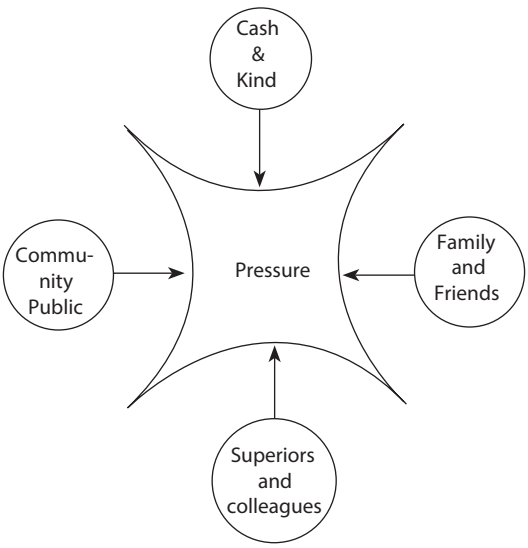

Fig. 1.16
Pressure

3. Conclusion

Forensic Science plays a crucial role in the dissemination of justice. Unethical practices in its functioning betray justice. A code of conduct (one of the three essential ingredients of ethics:

morals, character and conduct) is, therefore, essential for its practitioners. The Chief Forensic Scientist to the Government of India may take up the task.

Ethical conduct in the practice of Forensic Science has many facets:

- Scientific inputs (Si)
- Sound expertise (E)
- Adequate available technology (T)
- Prevalence of scientific work culture (W)

The ethics in Forensic Science (E_{FS},) therefore, is indicated by:

$$\mathbf{E_{FS} \propto S_i\,(E+T+W)} \tag{1}$$

Some ethical character factors have an inhibiting effect on the value of the expertise. They are:

- Bias (B)
- Pressure—influence (P).

Even the smallest amount of these factors destroys the values of the expertise as it affects the ethical character of the scientist inversely and exponentially. This aspect of ethic is graphically represented as under:

$$E_{FS} \propto \frac{1}{(B+P)} \tag{2}$$

It is somewhat modified by scientific environment prevailing in the country and in the criminal justice system. This factor may be represented by 'K'. Thus, the ethics (both conduct and character from (1) and (2) in Forensic Science may be formulated as (3):

$$E_{FS} = K\ \frac{Si\,(E+T+W)}{(B+P)} \tag{3}$$

1.10 SUPREME COURT CASES

(21st century)

1.10.1 Emerging Fields of Forensics[7]

Author's Summary

This is an unfortunate negative landmark SC judgment on noetic sciences, namely, *polygraph/ narco-analysis/the Brain Electrical Activation Profile (BEAP)* tests. It disallowed their effective use as evidence in courts and allowed their use in investigation only, subject to the consent of the accused.

The ruling, thereby, tacitly allowed the investigators to use their traditional III Degree modes in interrogation. It, thus, promote inhuman treatment of the suspect under interrogation.

The SC has ruled that for voluntary use of these scientific tests, the guideline provided by the Human Right Commission must be followed scrupulously.

Highlights italicised

7. *Selvi v State of Karnataka,* AIR 2010 SC 1974.

Relevant Extracts (Verbatim)

1. The legal questions in this batch of criminal appeals relate to the involuntary administration of certain scientific techniques, namely ***narcoanalysis, polygraph examination and the Brain Electrical Activation Profile (BEAP)*** test for the purpose of improving investigation efforts in criminal cases. This issue has received considerable attention since it involves tensions between the desirability of efficient investigation and the preservation of individual liberties. Ordinarily the judicial task is that of evaluating the rival contentions in order to arrive at a sound conclusion. However, the present case is not an ordinary dispute between private parties. It raises pertinent questions about the meaning and scope of fundamental rights which are available to all citizens. Therefore, we must examine the implications of permitting the use of the impugned techniques in a variety of settings.

2. Objections have been raised in respect of instances where individuals who are the accused, suspects or witnesses in an investigation have been subjected to these tests without their consent. Such measures have been defended by citing the importance of extracting information which could help the investigating agencies to prevent criminal activities in the future as well as in circumstances where it is difficult to gather evidence through ordinary means. In some of the impugned judgments, reliance has been placed on certain provisions of the Code of Criminal Procedure, 1973 and the Indian Evidence Act, 1872 to refer back to the responsibilities placed on citizens to fully co-operate with investigation agencies. It has also been urged that administering these techniques does not cause any bodily harm and that the extracted information will be used only for strengthening investigation efforts and will not be admitted as evidence during the trial stage. The assertion is that improvements in fact-finding during the investigation stage will consequently help to increase the rate of prosecution as well as the rate of acquittal. Yet another line of reasoning is that these scientific techniques are a softer alternative to the regrettable and allegedly widespread use of 'third degree methods' by investigators.

3. *The involuntary administration of the impugned techniques prompts questions about the protective scope of the 'right against self-incrimination' which finds a place in Article 20(3) of our Constitution. In one of the impugned judgments, it has been held that the information extracted through methods such as 'polygraph examination' and the 'Brain Electrical Activation Profile (BEAP) test' cannot be equated with 'testimonial compulsion' because the test subject is not required to give verbal answers, thereby falling outside the protective scope of Article 20(3). It was further ruled that the verbal revelations made during a narcoanalysis test do not attract the bar of Article 20(3) since the inculpatory or exculpatory nature of these revelations is not known at the time of conducting the test.*

To address these questions among others, it is necessary to inquire into the historical origins and rationale behind the 'right against self-incrimination'. The principal questions are whether this right extends to the investigation stage and whether the test results are of a 'testimonial' character, thereby attracting the protection of Article 20(3). Furthermore, we must examine whether relying on the test results or materials discovered with the help of the same creates a reasonable likelihood of incrimination for the test subject.

4. We must also deal with arguments invoking the guarantee of 'substantive due process' which is part and parcel of the idea of 'personal liberty' protected by article 21 of the Constitution. The first question in this regard is whether the provisions in the Code of Criminal Procedure, 1973 that provide for 'medical examination' during the course of an investigation can be read expansively to include the impugned techniques, even though the latter is not explicitly enumerated. To answer this question, it will be necessary to discuss the principles governing the interpretation of statutes in light of scientific advancements. Questions have also been raised with respect to the professional ethics of medical personnel involved in the administration of these techniques. Furthermore, article 21 has been judicially expanded to include a 'right against cruel, inhuman or degrading treatment', which requires us to determine whether the involuntary

administration of the impugned techniques violates this right whose scope corresponds with evolving international human rights norms. We must also consider contentions that have invoked the test subject's 'right to privacy', both in a physical and mental sense.

5. The scientific validity of the impugned techniques has been questioned and it is argued that their results are not entirely reliable. For instance, the narcoanalysis technique involves the intravenous administration of sodium pentothal, a drug which lowers inhibitions on part of the subject and induces the person to talk freely. However, empirical studies suggest that the drug-induced revelations need not necessarily be true. Polygraph examination and the BEAP test are methods which serve the respective purposes of lie-detection and gauging the subject's familiarity with information related to the crime.

These techniques are essentially confirmatory in nature, wherein inferences are drawn from the physiological responses of the subject. However, the reliability of these methods has been repeatedly questioned in empirical studies.

In the context of criminal cases, the reliability of scientific evidence bears a causal link with several dimensions of the right to a fair trial such as the requisite standard of proving guilt beyond a reasonable doubt.

* * *

7. At this stage, it will be useful to frame the questions of law and outline the relevant sub-questions in the following manner:

I. Whether the involuntary administration of the impugned techniques violates the 'right against self-incrimination' enumerated in article 20(3) of the Constitution?

I-A. Whether the investigative use of the impugned techniques creates a likelihood of incrimination for the subject?

I-B. Whether the results derived from the impugned techniques amount to 'testimonial compulsion' thereby attracting the bar of article 20(3)?

II. Whether the involuntary administration of the impugned techniques is a reasonable restriction on 'personal liberty' as understood in the context of article 21 of the Constitution?

It was unanimously held that the 'general acceptance' standard articulated in Frye (supra.) had since been displaced by the enactment of the Federal Rules of Evidence in 1975, wherein rule 702 governed the admissibility of expert opinion testimony that was based on scientific findings. This rule provided that:

> *If scientific, technical, or other specialized knowledge will assist the trier of fact to understand the evidence or to determine a fact in issue, a witness qualified as an expert by knowledge, skill, experience, training, or education, may testify thereto in the form of an opinion or otherwise.*

23. It was held that the trial court should have evaluated the scientific evidence as per rule 702 of the Federal Rules of Evidence which mandates an inquiry into the relevance as well as the reliability of the scientific technique in question. The majority opinion (Blackmun, J.) noted that the trial judge's step should be a preliminary assessment of whether the testimony's underlying reasoning or methodology is scientifically valid and whether it can be properly applied to the facts in issue. Several other considerations will be applicable, such as:

1. whether the theory or technique in question can be and has been tested
2. whether it has been subjected to peer review and publication
3. its known or potential error rate
4. the existence and maintenance of standards controlling its operation
5. whether it has attracted widespread acceptance within the scientific community

24. It was further observed that such an inquiry should be a flexible one, and its focus must be solely on principles and methodology, not on the conclusions that they generate. It was reasoned that instead of the wholesale exclusion of scientific evidence on account of the high threshold of proving "general acceptance in the particular field," the same could be admitted and then challenged through conventional methods such as cross-examination, presentation of contrary evidence and careful instructions to juries about the burden of proof. In this regard, the trial judge is expected to perform a 'gate-keeping' role to decide on the admission of expert testimony based on scientific techniques. It should also be kept in mind that Rule 403 of the Federal Rules of Evidence, 1975 empowers a trial judge to exclude any form of evidence if it is found that its probative value will be outweighed by its prejudicial effect.

* * *

1.10.2 Conclusion

221. *In our considered opinion, the compulsory administration of the impugned techniques*[8] *violates the 'right against self-incrimination'. This is because the underlying rationale of the said right is to ensure the reliability as well as voluntariness of statements that are admitted as evidence. This Court has recognised that the protective scope of Article 20(3) extends to the investigative stage in criminal cases and when read with section 161(2) of the Code of Criminal Procedure, 1973 it protects accused persons, suspects as well as witnesses who are examined during an investigation. The test results cannot be admitted in evidence if they have been obtained through the use of compulsion. Article 20(3) protects an individual's choice between speaking and remaining silent, irrespective of whether the subsequent testimony proves to be inculpatory or exculpatory. Article 20(3) aims to prevent the forcible 'conveyance of personal knowledge that is relevant to the facts in issue'. The results obtained from each of the impugned tests bear a 'testimonial' character and they cannot be categorized as material evidence.*

222. We are also of the view that forcing an individual to undergo any of the impugned techniques violates the standard of 'substantive due process' which is required for restraining personal liberty. Such a violation will occur irrespective of whether these techniques are forcibly administered during the course of an investigation or for any other purpose since the test results could also expose a person to adverse consequences of a non-penal nature. The impugned techniques cannot be read into the statutory provisions which enable medical examination during investigation in criminal cases, *i.e.,* the *Explanation* to sections 53, 53A and 54 of the Code of Criminal Procedure, 1973. Such an expansive interpretation is not feasible in light of the rule of '*ejusdem generis*' and the considerations which govern the interpretation of statutes in relation to scientific advancements.

> *We have also elaborated how the compulsory administration of any of these techniques is an unjustified intrusion into the mental privacy of an individual. It would also amount to 'cruel, inhuman or degrading treatment' with regard to the language of evolving international human rights norms. Furthermore, placing reliance on the results gathered from these techniques comes into conflict with the "right to fair trial". Invocations of a compelling public interest cannot justify the dilution of constitutional rights such as the 'right against self-incrimination'.*
>
> *223. In light of these conclusions, we hold that no individual should be forcibly subjected to any of the techniques in question, whether in the context of investigation in criminal cases or otherwise. Doing so would amount to an unwarranted intrusion into personal liberty. However, we do leave room for the voluntary administration of the impugned techniques in the context of criminal justice, provided that certain safeguards are in place. Even when the subject has given consent to undergo any of these tests, the test results by themselves cannot be admitted as evidence because the subject does not exercise conscious control over the responses during the administration of the test. However, any information or material that is subsequently discovered with the help of voluntary administered test results can be admitted, in accordance with section 27 of the Evidence Act, 1872.*

8. Polygraph Test, Narco-analysis, and Brain Electrical Activation Profile.

The National Human Rights Commission had published 'Guidelines for the Administration of Polygraph Test (Lie Detector Test) on an Accused' in 2000. These guidelines should be strictly adhered to and similar safeguards should be adopted for conducting the 'Narcoanalysis technique' and the 'Brain Electrical Activation Profile' test.

The text of these guidelines has been reproduced below:

(i) No Lie Detector Tests should be administered except on the basis of the consent of the accused. An option should be given to the accused whether he wishes to avail such test.

(ii) If the accused volunteers for a Lie Detector Test, he should be given access to a lawyer and the physical, emotional and legal implication of such a test should be explained to him by the police and his lawyer.

(iii) The consent should be recorded before a Judicial Magistrate.

(iv) During the hearing before the Magistrate, the person alleged to have agreed should be duly represented by a lawyer.

(v) At the hearing, the person in question should also be told in clear terms that the statement that is made shall not be a "confessional" statement to the Magistrate but will have the status of a statement made to the police.

(vi) The Magistrate shall consider all factors relating to the detention including the length of detention and the nature of the interrogation.

(vii) The actual recording of the Lie Detector Test shall be done by an independent agency (such as a hospital) and conducted in the presence of a lawyer.

(viii) A full medical and factual narration of the manner of the information received must be taken on record.

1.10.3 Brain Mapping[9]

Author's Summary

A.K. Telgi, a master forger, committed forgery and fraud on an unprecedented scale. He looted thousands of crores of rupees by producing and selling fake stamp paper. He was convicted for the crime; though the SC did not accept the new type of evidence (brain printing) produced by the prosecution dubbing it was vague and not well established.

Highlights italicised

Relevant Extracts (Verbatim)

III. According to the prosecution, the following circumstance could not be explained by the applicant.

(a) The fact that he had closed door meeting with A.K. Telgi in isolation between himself and A.K.L. Telgi only to the exclusion of other high ranking officers (Statement of ACP Supriya Patil at Page No. 11912. DCP (HQ) Koregaonkar at Page No. 11898 and DCP Jay Jadhav at Page No. 111940).

(b) The applicant knew A.K.L. Telgi even when he was at Mumbai earlier is also apparent from the statement of DCP Vasant Koregaonkar (Page No. 11898).

9. *Ranjitsing Brahmajeetsing Sharma v State of Maharashtra*, AIR 2005 SC 2277 : AIR 2005 SCW 2215 : 2005 Cr LJ 2533.

(c) Brain Maping (P. 300) of AKL Telgi, shows that he had given positive responses to the question relating to payment made to the applicant, favour shown by the applicant in Pune cases and facilities provided in Mumbai custody by the applicant (Page No. 12960 to 12963)."

13. The plea taken by the Appellant herein about his innocence was rejected by the High Court.

87. *Apart from the fact that nothing has been brought on record to show as to how far a report of brain mapping test can be relied upon, the report appears to be vague. It appears, the Respondents themselves did not want to put much reliance on the said report.*

88. Furthermore, the admissibility of a result of a scientific test will depend upon its authenticity. Whether the brain mapping test is so developed that the report will have a probative value so as to enable a court to place reliance thereupon, is a matter which would require further consideration, if and when the materials in support thereof are placed before the Court.

89. In *Frye v United States,* [293 F 1013 (DC Cir) (1923)], the principles to determine the strength of any investigation to make it admissible were stated in the following terms:

> Just when a scientific principle or discovery crosses the line between the experimental and demonstrable stages is difficult to define. Somewhere in the twilight zone the evidential force must be recognized, and while the Courts will go a long way in admitting the expert testimony deduced from a well-recognized scientific principle or discovery, the thing from which the deduction is made must be sufficiently established to have gained general acceptance in the particular field in which it belongs.

90. *Frye* (supra), however, was rendered at a time when the technology, the polygraph test, was in its initial stage and was used in few laboratories. The guidelines issued therein posed a threat of lack of judicial adaptation of the new developments and ignored the reliability on a particular piece of evidence.

1.10.4 Nirbhaya Rape-murder[10]

Author's Summary

It is a landmark judgment where the judges have utilised Forensic Science extensively for the dissemination of justice in this case of inhuman brutal rape- murder case.

The facts of the case are that the victim Nirbhaya, along with her friend (PW- 1) boarded a bus going to Dwarka/Palam. They noticed that six persons were already inside the bus. The accused did not allow anyone else to board. The bus moved and the inside lights of the bus were put off. A few minutes later, three persons (identified as accused Ram Singh, Akshay and a juvenile) started to abuse. Pw-1 objected that led to altercation. The two other joined the melee. PW-1 was beaten badly. He became immobile. Nirbhaaya was raped by all the six mauled, her so beastly/brutally that she died a few days later, in spite of the best medical help.

The police did an excellent job of locating and using all the available scientific evidence (CCTV footage for the identification of bus, fingerprints, bite marks, hair, DNA to inter-link the victims and the culprits) and presented an airtight case.

All the courts (trial/ high courts and the Supreme Court) appreciated the evidence. They found it **'rarest of the rare cases'** and sentenced them to death, excluding the juvenile.

Highlights italicised

10. *Mukesh v State for NCT Delhi*, Criminal Appeal Nos. 607–608 of 2017, decided on 5 May 2017 (SC). Bench: Dipak Misra, R Banumathi, Ashok Bhushan.
The Supreme Court has discussed the evidence relating to DNA, Bite Marks and Fingerprint lucidly, with numerous case citations.

Relevant Extracts (Verbatim)

1. The prosecution case, as projected, is that on 16 December 2012, the deceased, 'Nirbhaya' (not her real name), had gone with her friend, the informant, PW- 1, to the PVR situated in Select City Walk Mall, Saket to watch a movie. After the show was over, about 8:30 p.m., they took an auto and reached Munirka bus stand wherefrom they boarded a white coloured chartered bus [DL- 1P-C-0149, Ext.P1] which was bound to Dwarka/Palam Road, as a boy in the bus was calling for commuters for the said destination. As per the version of the informant, PW-1, the friend of the prosecutrix, the bus had yellow and green lines/stripes and the word "Yadav" was written on it.

2. After both of them had entered the bus, they noticed that six persons were already inside the bus, four in the cabin of the driver and two behind the driver's cabin. The deceased and the informant sat on the left side in the row of two-seaters and paid the fare of twenty rupees as demanded. Before they could get the feeling of a safe journey (though not a time-consuming journey), a feeling of lonely suffocation and a sense of danger barged in, for the accused persons did not allow anyone else to board and the bus moved and the lights inside the bus were put off. With the lights being put off, the darkness and the fear of the unexpected darkness ruled.

3. A few minutes later, three persons (who have been identified as accused Ram Singh, Akshay and a young boy, who has been treated as a juvenile in conflict with the law) came out of the driver's cabin and started to abuse PW- 1. The young companion of the deceased raised opposition to the abuse that led to an altercation which invited the other two who were sitting outside the driver's cabin to join.

4. The spirit to oppose and the duty to save the prosecutrix had to die down and perilously succumb to the assault by the accused persons with the iron rods that caused injuries to his head, both the legs and other parts of the body and the consequence was that he fell on the floor of the bus to hear the painful cries of the lady who, he knew, was being treated as an object, an article for experimentation and prey to the pervert proclivity of the six but could do nothing except to hear unbearable cries made in agony and pain. His spirit was dead, and bound to.

5. As the prosecution story further unfurls, the two accused persons, namely, Pawan and Vinay, pinned the young man down and robbed the victims of their mobiles besides robbing the informant of his purse carrying a Citi Bank credit card, ICICI Bank Debit Card, his identity card issued by his employer-company, metro card, a sum of rupees one thousand, his Titan Watch, a golden ring studded with jewels and a silver ring studded with pearl, black colour Hush Puppies shoes, black colour Numero Uno jeans, a grey colour pullover and a brown colour blazer. As per the version of the prosecution, PW-1 was carrying two mobiles and the prosecutrix was carrying only one, and the accused snatched away all the three mobiles.

6. The overpowering was not meant to satisfy the avarice. As the accusations proceed, after the informant was overpowered, as it could only have a singular result, the accused persons, namely, Ram Singh, Akshay and the Juvenile in Conflict with Law (JCL) took the prosecutrix to the rear side of the bus and she was raped by them, one after the other.

7. After committing rape, the accused Ram Singh (since deceased), accused Akshay and the JCL came towards the informant, PW-1, and nailed him down; then the accused Vinay and accused Pawan went to the rear side of the bus and committed rape on the prosecutrix, one by one. PW-1 noticed that earlier the bus was moving at fast speed but after some time, he felt that the speed of the bus was reduced and he saw that the accused Mukesh, who was driving the bus, came near him and hit him with the rod and he also went to the rear side of the bus and raped the prosecutrix.

The prosecutrix was brutally gang raped by the accused one after the other and she was also subjected to unnatural sex. Her private parts and her internal organs were seriously injured by inserting an iron rod and hand in the rectal and vaginal region. As per PW-1, he had heard the cries of the prosecutrix like "chod do, bachao". PW-1 could hear the prosecutrix shouting in a loud oscillating voice. The prosecutrix was carrying a grey colour purse having an Axis Bank ATM card and other belongings.

The accused persons robbed her of her belongings and stripped her. They also took away the clothes of the informant while beating him with iron rods. The accused were exhorting that both the victims be not left alive. The accused then tried to throw both the informant and the prosecutrix out of the moving bus from its rear door but could not open it and so, they brought them to the front door and threw them out of the moving bus at National Highway No. 8, Hotel Delhi 37, Mahipalpur flyover by the side of the road.

8. As indicated earlier, the prosecutrix and PW-1 were noticed by PW-72, Raj Kumar, who heard the voice of 'bachao, bachao' from the left side of the road near a milestone opposite to Hotel Delhi 37. PW-72 saw PW-1 and the prosecutrix sitting naked having blood all around. Immediately thereafter, PW-72, Raj Kumar, informed PW-70, Ram Pal, who was in the Control Room, requesting him to call PCR. PW-70, Ram Pal, of EGIS Infra Management India (P) Limited, dialled 100 No. and even asked his other patrolling staff to reach the spot.

9. About 10:24 p.m., PW-73, H.C. Ram Chander, who was in charge of PCR van Zebra 54, received information about the incident and the lying of victims in a naked condition near the foot of Mahipalpur flyover towards Dhaula Kuan opposite GMR Gate. PW-73 reached the spot and found the victims. He got the crowd dispersed and brought a bottle of water and a bedsheet from the nearby hotel and tore the same into two parts and gave it to both the victims to cover themselves.

Collection of samples and identity of accused persons

32. The blood sample of the informant was collected by Dr. Kamran Faisal, PW-15, Safdarjung Hospital, on 25.12.2012 and was handed over to SI Pratibha Sharma, PW-80, vide seizure memo Ex.PW-15/A by Constable Suresh Kumar, PW-42. Similarly, as mentioned earlier, PW-49, Dr. Rashmi Ahuja, had collected certain samples from the person of the prosecutrix which are reflected in Ex.PW-49/A from point B to B. All the samples were collected by Inspector Raj Kumari, PW-59, vide seizure memo Ex.PW-59/A and were handed over to PW-80, SI Pratibha Sharma, at Safdarjung Hospital in the morning of 17.12.2012.

Also the samples of gangrenous bowels of the prosecutrix were taken on 24.12.2012 and were handed over to SI Gajender Singh, PW-55, who seized the same vide seizure memo Ex.PW-11/A. All the samples were deposited with the MHC(M) and were not tampered with in any manner. A specimen of scalp hair of the prosecutrix was also taken on 24.12.2012 by Dr. Ranju Gandhi, PW-29, and was handed over to PW- 80, SI Pratibha Sharma, vide seizure memo Ex.PW-29/A.

33. The accused were also subjected to medical examination and samples were taken from their person which were sent for DNA analysis.

34. The *DNA analysis was done at the behest of PW-45, Dr. B.K. Mohapatra, Sr. Scientific Officer, Biology, CFSL, CBI, and Biological Examination and DNA profiling reports were prepared which are exhibited as Ex. PW-45/A-C. The report, after analysing the DNA profiles generated from the known samples of the prosecutrix, the informant, and each of the accused, concluded that: "An analysis of the above shows that the samples were authentic and established the identities of the persons mentioned above beyond reasonable doubt."*

35. On 17 December 2012 and 18 December 2012, a team of experts from the CFSL went to Thyagaraj Stadium and ***lifted chance prints from the bus*** in question, Ex.P-1. On 28.12.2012, PW-78, Inspector Anil Sharma of P.S. Vasant Vihar, the then S.H.O. of Police Station Vasant Vihar, requested the Director, CFSL, for taking digital palm prints and footprints of all the accused persons vide his letter Ex.PW-46/C. Pursuant to the said request made by PW-78, Inspector Anil Sharma, the CFSL, on 31.12.2012, took the finger/palm prints and footprints of the accused persons at Tihar Jail.

After comparing the chance prints lifted from the bus with the fingerprints/palm prints and footprints of all the accused persons, PW-46, Shri A.D. Shah, Senior Scientific Officer (Finger Prints), CFSL, CBI submitted his report Ex.PW- 46/D. In the report, the chance prints of accused Vinay Sharma were found to have matched with those on the bus in question.

36. ***Bite mark analysis was also undertaken by the investigative team to establish the identity and involvement of the accused persons. PW-66, Asghar Hussain, on the instructions of the I.O., S.I. Pratibha Sharma, had taken 10 photographs of different parts of the body of the prosecutrix at SJ Hospital on 20.12.2012 between 4:30 p.m. and 5:00 p.m. which were marked as Ex.PW-66/B (Colly.) [10 photographs of 5" × 7" each] and Ex.PW-66/C (Colly.) [10 photographs of 8" × 12" each]. PW-66 also proved in Court the certificate provided by him in terms of Section 65-B of the Evidence Act in respect of the photographs, Ex. PW-66/A.***

Thereafter, PW-18, SI Vishal Choudhary, collected the photographs and the dental models from Safdarjung Hospital on 01.01.2013 and duly deposited the same in the malkhana after he, PW-18, had handed them over to the S.H.O. Anil Sharma, PW-78. The same were later entrusted to S.I. Vishal Choudhary, PW-18 on 02.01.2013, which is proved vide RC No.183/21/12 and exhibited as Ex.PW-77/V. PW-71, Dr. Ashith B. Acharya, submitted the final report in this regard which is exhibited as Ex. PW-71/C. In the said report, he has concluded that at least three bite marks were caused by accused Ram Singh whereas one bite mark has been identified to have been most likely caused by accused Akshay.

Thereafter, on 03.01.2013, the report of the CFSL was received. In fact, the trial court had assured itself of the correct identification of the bus by playing the said CCTV footage shown in the pen drive, Ex.PW-67/1, and the CD, Ex.PW-67/2, during the cross-examination of PW-67, Pramod Jha.

98. Learned counsel Mr. Singh has asserted that bus, Ex. P-1, has been falsely implicated in the present case as is evidenced from the recovery of the CCTV footage. In an attempt to discredit the CCTV footage, he pointed out that only the CCTV recording alleged to be of this bus was recorded and not of all other white buses that had 'Yadav' written on them. The learned counsel for the defence subsequently maintained that the CCTV footage cannot be relied upon as the same has been tampered with by the investigating officers.

99. PW-76, Gautam Roy, HOD, Computer Cell, Forensic Division, has testified that on 02.01.2013, he had received two sealed parcels sealed with the seal of PS and the seals tallied with the specimen seals provided. He marked the blue coloured pen drive found in parcel No.1 as Ex.1 and the Moser Baer CD found in the second parcel as Ex.2. He further testified that both the exhibits were played by him on the computer and the bus was seen twice, at 9:34 p.m. and 9:54 p.m.

He had photographed all these three by freezing the pen drive and the CD and these photographs were compared by him with the photographs taken by the photographer, PW-79, P.K. Gottam, which he had summoned. The witness testified that he had prepared the three comparison charts in this regard as Ex.PW-76/B, PW-76/C and PW-76/D, and his detailed report as Ex.PW-76/E.

The footage taken in a CD and pen drive was sealed in PW-67's presence and as the recording was automatic data being fed on regular basis into the hard disk, the question of tampering with the

same could not arise. PW-79, P.K. Gottam, from CFSL, CBI, has stated in his examination that he took photographs of the bus bearing No.DL- 1P-C-0149 parked at Thyagaraj Stadium, INA, New Delhi from different angles on 17.12.2012 and 18.12.2012 and handed over the same to PW-76. The said photographs were marked as B1 in Ex.PW-76/B; as C1 and C2 in Ex.PW-76/C; and as D1 in Ex.PW-76/D. He has deposed as to the genuineness of the photographs by deposing that the software used for developing the photographs was tamper proof.

100. Once it is proved before the court through the testimony of the experts that the photographs and the CCTV footage are not tampered with, there is no reason or justification to perceive the same with the lens of doubt. The opinion of the CFSL expert contained in the CFSL report marked as Ex.PW-76/E authenticates that there was no tampering or editing in both the exhibits, Ex.P-67/1 and Ex.P- 67/2, and that a bus having identical patterns as the one parked at Thyagraj Stadium is seen in the CCTV footage, which includes the word "Yadav" written on one side, "back side dent (left)" and absence of wheel cover on the front left side. The contents of the report is also admitted to be true by its author, PW-76, Gautam Roy. Quite apart from that, it is perceptible that the High Court, in order to satisfy itself, had got the CCTV footage played during the hearing and found the same to be creditworthy and acceptable. 157.

207. *Having dealt with the aspect pertaining to insertion of rod, it is apposite to advert to the medical evidence and post mortem report. We have, while dealing with other aspects, referred to certain aspects including* ***DNA analysis*** *of medical evidence but the same requires to be critically dealt with as the prosecution has placed heavy reliance upon it.*

208. DNA is the abbreviation of Deoxyribonucleic Acid. It is the basic genetic material in all human body cells. It is not contained in red blood corpuscles. It is, however, present in white corpuscles. It carries the genetic code. DNA structure determines human character, behaviour and body characteristics. DNA profiles are encrypted sets of numbers that reflect a person's DNA makeup which, in forensics, is used to identify human beings. DNA is a complex molecule. It has a double helix structure which can be compared with a twisted rope 'ladder'.

209. The nature and characteristics of DNA had been succinctly explained by Lord Justice Phillips in Regina v Alan James Doheny & Gary Adams[83]. In the above case, the accused were convicted relying on results obtained by comparing DNA profiles obtained from a stain left at the scene of the crime with DNA profiles obtained from a sample of blood provided by the appellant. In the above context, with regard to DNA, the following was stated by Lord Justice Phillips: "Deoxyribonucleic acid, or DNA, consists of long ribbon-like molecules, the chromosomes, 46 of which lie tightly coiled in nearly every cell of the body. These chromosomes - 23 provided from the mother and 23 from the father at conception, form the genetic blueprint of the body. Different sections of DNA have different identifiable and discrete characteristics.

When a criminal leaves a stain of blood or semen at the scene of the crime it may prove possible to extract from that crime stain sufficient sections of DNA to enable a comparison to be made with the same sections extracted from a sample of blood provided by the suspect. This process is complex and we could not hope to describe it more clearly or succinctly than did Lord Taylor C.J. in the case of Deen (transcript: December 21, 1993), so we shall gratefully adopt his description. "The process of DNA profiling starts with DNA being extracted from the crime stain and also from a sample taken from the suspect. In each case the DNA is cut into smaller lengths by specific enzymes. The fragments produced are sorted according to size by a process of electrophoresis.

This involves placing the fragments in a gel and drawing them electromagnetically along a track through the gel. The fragments with smaller molecular weight travel further than the heavier ones. The pattern thus created is transferred from the gel onto a membrane. Radioactive DNA probes, taken from elsewhere, which bind with the sequences of most interests in the sample DNA are then applied. After the excess of the DNA probe is washed off, an X-ray film is placed over the membrane

to record the band pattern. This produces an auto radiograph which can be photographed. When the crime stain DNA and the sample DNA from the suspect have been run in separate tracks through the gel, the resultant auto-radiographs can be compared. The two DNA profiles can then be said either to match or not.""

210. In the United States, in an early case Frye v United States [84], it was laid down that scientific evidence is admissible only if the principle on which it is based is substantially established to have general acceptance in the field to which it belonged. The US Supreme Court reversed the above formulation in Daubert v Merrell Dow Pharmaceuticals, Inc.[85] stating thus: "11. Although the Frye decision itself focused exclusively on "novel" scientific techniques, we do not read the requirements of Rule 702 to apply specially or exclusively to unconventional evidence. of course, well- established propositions are less likely to be challenged than those that are novel, and they are more handily defended. Indeed, theories that are so firmly established as to have attained the status of scientific law, such as the laws of thermodynamics, properly are subject to judicial notice under Fed.Rule Evid.201.

13. This is not to say that judicial interpretation, as opposed to adjudicative fact finding, does not share basic characteristics of the scientific endeavour: "The work of a judge is in one sense enduring and in another ephemeral... In the endless process of testing and retesting, there is a constant rejection of the dross and a constant retention of whatever is pure and sound and fine." B.Cardozo, The nature of the Judicial Process 178, 179 (1921)."

211. The principle was summarized by Blackmun, J., as follows: "To summarize: "general acceptance" is not a necessary precondition to the admissibility of scientific evidence under the Federal Rules of Evidence, but the Rules of Evidence-especially Rule 702-do assign to the trial judge the task of ensuring that an expert's testimony both rests on a reliable foundation and is relevant to the task at hand. Pertinent evidence based on scientifically valid principles will satisfy those demands. The inquiries of the District Court and the Court of Appeals focused almost exclusively on "general acceptance," as gauged by publication and the decisions of other courts. Accordingly, the judgment of the Court of Appeals is vacated and the case is remanded for further proceedings consistent with this opinion."

212. After the above judgment, the DNA Test has been frequently applied in the United States of America. In District Attorney's Office for the Third Judicial District et al. v William G. Osborne[86], Chief Justice Roberts of the Supreme Court of United States, while referring to the DNA Test, stated as follows: "DNA testing has an unparalleled ability both to exonerate the wrongly convicted and to identify the guilty. It has the potential to significantly improve both the criminal justice system and police investigative practices.

The Federal Government and the States have recognized this, and have developed special approaches to ensure that this evidentiary tool can be effectively incorporated into established criminal procedure-usually but not always through legislation. ... ... Modern DNA testing can provide powerful new evidence unlike anything known before. Since its first use in criminal investigations in the mid- 1980s, there have been several major advances in DNA technology, culminating in STR technology. It is now often possible to determine whether a biological tissue matches a suspect with near certainty. While of course many criminal trials proceed without any forensic and scientific testing at all, there is no technology comparable to DNA testing for matching tissues when such evidence is at issue."

213. DNA technology as a part of Forensic Science and scientific discipline not only provides guidance to the investigation but also supplies the Court accrued information about the tending features of identification of criminals. The recent advancement in modern biological research has regularized Forensic Science resulting in radical help in the administration of justice. In our country also like several other developed and developing countries, DNA evidence is being increasingly relied

upon by courts. After the amendment in the Criminal Procedure Code by the insertion of Section 53A by Act 25 of 2005, DNA profiling has now become a part of the statutory scheme. Section 53A relates to the examination of a person accused of rape by a medical practitioner.

214. Similarly, under Section 164A inserted by Act 25 of 2005, for medical examination of the victim of rape, the description of material taken from the person of the woman for DNA profiling is a must. Section 53A sub-section (2) as well as Section 164(A) sub-section (2) are to the following effect:

"Section 53A. Examination of a person accused of rape by Medical Practitioner.-

(1) ... ...

(2) The registered medical practitioner conducting such examination shall, without delay, examine such person and prepare a report of his examination giving the following particulars, namely:- the name and address of the accused and of the person by whom he was brought, the age of the accused, marks of injury, if any, on the person of the accused, the description of material taken from the person of the accused for DNA profiling, and other material particulars in reasonable detail. Section 164A. Medical Examination of the victim of rape.-

(1) ... ...

(2) The registered medical practitioner, to whom such woman is sent, shall, without delay, examine her person and prepare a report of his examination giving the following particulars, namely:- the name and address of the woman and of the person by whom she was brought; the age of the woman; the description of material taken from the person of the woman for DNA profiling; marks of injury, if any, on the person of the woman; general mental condition of the woman; and other material particulars in reasonable detail."

215. This Court had the occasion to consider various aspects of DNA profiling and DNA reports. K.T. Thomas, J. in Kamti Devi (Smt.) and another v Poshi Ram[87], observed:

"10. We may remember that Section 112 of the Evidence Act was enacted at a time when the modern scientific advancements with deoxyribonucleic acid (DNA) as well as ribonucleic acid (RNA) tests were not even in contemplation of the legislature. The result of a genuine DNA test is said to be scientifically accurate. ..."

216. In Pantangi Balarama Venkata Ganesh v State of Andhra Pradesh[88], a two-Judge Bench had explained as to what is DNA in the following manner:

"41. Submission of Mr Sachar that the report of DNA should not be relied upon, cannot be accepted. What is DNA? It means: "Deoxyribonucleic acid, which is found in the chromosomes of the cells of living beings is the blueprint of an individual. DNA decides the characteristics of the person such as the colour of the skin, type of hair, nails and so on. Using this genetic fingerprinting, identification of an individual is done like in the traditional method of identifying fingerprints of offenders.

The identification is hundred per cent precise, experts opine." There cannot be any doubt whatsoever that there is a need of quality control. Precautions are required to be taken to ensure preparation of high molecular weight DNA, complete digestion of the samples with appropriate enzymes, and perfect transfer and hybridization of the blot to obtain distinct bands with appropriate control. (See the article of Lalji Singh, Centre for Cellular and Molecular Biology, Hyderabad in DNA profiling and its applications.) But in this case there is nothing to show that such precautions were not taken.

42. Indisputably, the evidence of the experts is admissible in evidence in terms of Section 45 of the Evidence Act, 1872. In cross-examination, PW 46 had stated as under: "If the DNA fingerprint of a person matches with that of a sample, it means that the sample has come from that person only. The probability of two persons except identical twins having the same DNA fingerprint is around 1 in 30 billion world population.""

217. In Santosh Kumar Singh v State Through CBI[89], which was a case of a young girl who was raped and murdered, the DNA reports were relied upon by the High Court which were approved by this Court and it was held thus:

"71. We feel that the trial court was not justified in rejecting the DNA report, as nothing adverse could be pointed out against the two experts who had submitted it. We must, therefore, accept the DNA report as being scientifically accurate and an exact science as held by this Court in Kamti Devi v Poshi Ram (supra). In arriving at its conclusions the trial court was also influenced by the fact that the semen swabs and slides and the blood samples of the appellant had not been kept in proper custody and had been tampered with, as already indicated above. We are of the opinion that the trial court was in error on this score. We, accordingly, endorse the conclusions of the High Court on Circumstance 9."

218. In Inspector of Police, Tamil Nadu v John David[90], a young boy studying in MBBS Course was brutally murdered by his senior. The torso and head were recovered from different places which were identified by the father of the deceased. For confirming the said facts, the blood samples of the father and mother of the deceased were taken which were subject to the DNA test. From the DNA, the identification of the deceased was proved. Paragraph 60 of the decision is reproduced below: "60. ... The said fact was also proved from the DNA test conducted by PW 77. PW 77 had compared the tissues taken from the severed head, torso and limbs and on scientific analysis he has found that the same gene found in the blood of PW1 and Baby Ponnusamy was found in the recovered parts of the body and that therefore they should belong to the only missing son of PW 1."

219. In Krishan Kumar Malik v State of Haryana[91], in a gang rape case when the prosecution did not conduct DNA test or analysis and matching of semen of the appellant-accused with that found on the undergarments of the prosecutrix, this Court held that after the incorporation of Section 53- A in CrPC, it has become necessary for the prosecution to go in for DNA test in such type of cases. The relevant paragraph is reproduced below:

"44. Now, after the incorporation of Section 53-A in the Cr.P.C w.e.f 23.06.2006, brought to our notice by the learned counsel for the respondent-State, it has become necessary for the prosecution to go in for DNA test in such type of cases, facilitating the prosecution to prove its case against the accused. Prior to 2006, even without the aforesaid specific provision in CrPC the prosecution could have still restored to this procedure of getting the DNA test or analysis and matching of semen of the appellant with that found on the undergarments of the prosecutrix to make it a foolproof case, but they did not do so, thus they must face the consequences."

220. In Surendra Koli v State of Uttar Pradesh [92], the appellant, a serial killer, was awarded the death sentence which was confirmed by the High Court. While confirming the death sentence, this Court relied on the result of the DNA test conducted on the part of the body of the deceased girl. Para 12 is reproduced below:- "12. The DNA test of Rimpa by CDFD, a pioneer institute in Hyderabad matched with that of blood of her parents and brother. The doctors at AIIMS have put the parts of the deceased girls which have been recovered by the doctors of AIIMS together. These bodies have been recovered in the presence of the doctors of AIIMS at the pointing out by the accused Surendra Koli. Thus, recovery is admissible under Section 27 of the Evidence Act."

221. In Mohammed Ajmal Mohammad Amir Kasab alias Abu Mujahid v State of Maharashtra[93], the accused was awarded death sentence on charges of killing a large number of innocent persons on 26th November, 2008 at Bombay. The accused with others had come from Pakistan using a boat 'Kuber' and several articles were recovered from 'Kuber'. The stains of sweat, saliva and other bodily secretions on those articles were subjected to DNA test and the DNA test matched with several accused. The Court observed:

222. In Sandeep v State of Uttar Pradesh[94], the facts related to the murder of pregnant paramour/girlfriend and unborn child of the accused. The DNA report confirmed that the appellant

was the father of the unborn child. The Court, relying on the DNA report, stated as follows: "67. In the light of the said expert evidence of the Junior Scientific Officer it is too late in the day for the appellant Sandeep to contend that improper preservation of the foetus would have resulted in a wrong report to the effect that the accused Sandeep was found to be the biological father of the foetus received from the deceased Jyoti.

As the said submission is not supported by any relevant material on record and as the appellant was not able to substantiate the said argument with any other supporting material, we do not find any substance in the said submission. The circumstance, namely, the report of DNA in having concluded that accused Sandeep was the biological father of the recovered foetus of Jyoti was one other relevant circumstance to prove the guilt of the said accused."

223. In Rajkumar v State of Madhya Pradesh[95], the Court was dealing with a case of rape and murder of a 14 year old girl. The DNA report established the presence of semen of the appellant in the vaginal swab of the prosecutrix. The conviction was recorded relying on the DNA report. In the said context, the following was stated:

"8. The deceased was 14 years of age and a student in VIth standard which was proved from the school register and the statement of her father Iknis Jojo (PW1). Her age has also been mentioned in the FIR as 14 years. So far as medical evidence is concerned, it was mentioned that the deceased prosecutrix was about 16 years of age. So far as the analysis report of the material sent and the DNA report is concerned, it revealed that semen of the appellant was found on the vaginal swab of the deceased. The clothes of the deceased were also found having appellant's semen spots. The hair which was found near the place of occurrence was found to be that of the appellant."

224. In Nandlal Wasudeo Badwaik v Lata Nandlal Badwaik and another[96], the appellant, father of the child born to his wife, questioned the paternity of the child on the ground that she did not stay with him for the last two years. The Court directed for a DNA test. The DNA result opined that the appellant was not the biological father of the child. The Court also had the occasion to consider Section 112 of the Evidence Act which raises a presumption that birth during marriage is conclusive proof of legitimacy. The Court relied on the DNA test holding the DNA test to be scientifically accurate. The pertinent observations are extracted below:

"19. The husband's plea that he had no access to the wife when the child was begotten stands proved by the DNA test report and in the face of it, we cannot compel the appellant to bear the fatherhood of a child, when the scientific reports prove to the contrary. We are conscious that an innocent child may not be bastardised as the marriage between her mother and father was subsisting at the time of her birth, but in view of the DNA test reports and what we have observed above, we cannot forestall the consequence. It is denying the truth. "Truth must triumph" is the hallmark of justice.

20. As regards the authority of this Court in Kamti Devi, this Court on appreciation of evidence came to the conclusion that the husband had no opportunity whatsoever to have liaison with the wife. There was no DNA test held in the case. In the said background i.e. non-access of the husband to the wife, this Court held that the result of DNA test "is not enough to escape from the conclusiveness of Section 112 of the Act."

The judgment has to be understood in the factual scenario of the said case. The said judgment has not held that DNA test is to be ignored. In fact, this Court has taken note of the fact that the DNA test is scientifically accurate. We hasten to add that in none of the cases referred to above, this Court confronted with a situation in which a DNA test report, in fact, was available and was in conflict with the presumption of conclusive proof of legitimacy of the child under Section 112 of the Evidence Act.

In view of what we have observed above, these judgments in no way advance the case of the respondents." From the aforesaid authorities, it is quite clear that DNA report deserves to be accepted unless it is absolutely dented and for non- acceptance of the same, it is to be established that there had

been no quality control or quality assurance. If the sampling is proper and if there is no evidence as to tampering of samples, the DNA test report is to be accepted.

225. In order to establish a clear link between the accused persons and the incident at hand, the prosecution has also adduced scientific evidence in the form of DNA, fingerprint and bite mark analysis.

226. Various samples, for the purpose of DNA profiling, were lifted from the person of the prosecutrix; the informant; the accused, their clothes/ articles; the dumping spot; the iron rods; the ashes of partly burnt clothes; as well as from the offending bus. PW-45, Dr. B.K. Mohapatra, analysed the said DNA profiles and submitted his report thereof. In his report, he concluded that the samples were authentic and capable of establishing the identities of the persons concerned beyond a reasonable doubt.

Guidelines and methodology documented in the Working Procedure Manuals of the laboratory which have been validated and recommended for use in the laboratory. He further added that once a DNA profile is generated, its accuracy is 100%. The trial court and the High Court have consistently noted that the counsel for the defence did not raise any substantial ground to challenge the DNA report during the cross-examination of PW-45. In such circumstances, there is no reason to declare the DNA report as inaccurate, especially when it clearly links the accused persons with the incident.

227. After establishing the identities of each of the accused persons, the informant and the prosecutrix through DNA analysis, ***the DNA profiles*** *generated from the remaining samples, where the identity of biological material found thereon needed to be ascertained, were matched with the DNA profiles of the prosecutrix, the informant and the accused, generated earlier from known samples. Such an analysis cogently linked each of the accused with the victims as also with the crime scene. A summary of the findings in the report submitted by PW-45, Dr. B.K. Mohapatra, is as under:*

"S.No.	*Accused*	*DNA EVIDENCE*
1	*Ram Singh*	*Rectal swab from the prosecutrix contained DNA of male origin, which was found consistent with the DNA developed from the blood sample of this accused.*
		DNA profile developed from the blood stains from the underwear, T-shirt and slippers of this accused was found consistent with the DNA of the prosecutrix.
2	*Mukesh*	*DNA profile developed from the blood stains from the pants, T-shirt and jacket of this accused was found consistent with the DNA of the prosecutrix.*
3	*Akshay*	*Breast swab of the prosecutrix contained DNA of male origin which was found consistent with the DNA of this accused.*
		DNA profile developed from the blood stains from the jeans of this accused was found consistent with the DNA of the prosecutrix.
4	*Vinay*	*DNA profile developed from the blood stains from the underwear, jacket and slippers of this accused was found consistent with the DNA of the prosecutrix.*
5	*Pawan*	*DNA profile developed from the blood stains from the sweater and shoes and slippers of this accused was found consistent with the DNA of the prosecutrix."*

228. Further, a summary of the DNA analysis of the biological samples lifted from the material objects such as the bus, the iron rods, and the ash and unburnt pieces of clothes is also worth producing here:

"Serial No.	*Identity of the Victim*	*Findings of DNA Analysis*
	Informant	*The DNA profile developed from burnt cloth pieces were found to be of male origin and was consistent with the DNA profile of complainant.*
		The bunch of DNA profile developed from hair and blood stained pieces of paper recovered from the bus was found consistent with the DNA profile of complainant.
		The DNA profile developed from blood stained dried leaves collected from the place where both the victims were thrown matched with the DNA profile of complainant.
	Prosecutrix	*The DNA profile developed from blood stains from both the iron rods recovered at the instance of accused Ram Singh from bus was of female origin and was consistent with the DNA profile of prosecutrix.*
		The DNA profile developed from blood stains from curtains of the bus matched with the DNA profile of prosecutrix.
		The DNA profile developed from blood stains from seat covers was found consistent with the DNA profile of prosecutrix.
		DNA profile developed from blood stains from the bunch of the hair recovered from floor of the bus below sixth row seat, blood stains prepared from the roof of the bus near back gate, blood stains prepared from the floor of the bus near back gate, blood stains taken from side of back stairs of the bus, and blood stains taken from the inner side of the back door of the bus was found consistent with the DNA profile of prosecutrix.

230. Mr. Sharma, learned counsel appearing for appellants - Mukesh and Pawan Kumar Gupta, submitted that in the instant case, the DNA test cannot be treated to be accurate, for there was blood transfusion as the prosecutrix required blood and when there is mixing of blood, the DNA profiling is likely to differ. It is seemly to note, nothing had been put to the expert in his cross-examination in this regard. As the authorities relating to DNA would show, if the quality control is maintained, it is treated to be quite accurate and as the same has been established, we are compelled to repel the said submission of Mr. Sharma.

The evidence relating to finger print analysis:

231. Next aspect that is required to be adverted is the **evidence of fingerprint analysis** adduced by the prosecution to establish the identity of the accused persons. By virtue of the finger print analysis, the prosecution has tried mainly to establish the presence of the accused in the offending bus. On 17.12.2012 and 18.12.2012, a team of experts from the CFSL had lifted chance finger prints from the concerned bus, Ex.P-1, at Thyagraj Stadium. On 28.12.2012, PW-78, Inspector Anil Sharma of P.S. Vasant Vihar, the then S.H.O. of Police Station Vasant Vihar, requested the Director, CFSL for taking digital palm prints and foot prints of all the accused persons vide his letter Ex.PW-46/C. Pursuant to the said request made by PW-78, Inspector Anil Sharma, the CFSL on 31.12.2012 took the finger/palm prints and foot prints of the accused persons at Tihar Jail. After comparing the chance prints lifted from the bus with the finger prints/palm prints and foot prints of all the accused persons, PW-46, Shri A.D. Shah, Senior Scientific Officer (Finger Prints), CFSL, CBI, submitted his report, Ex.PW-46/D.

232. As per the report, Ex.PW-46/D, the result of the aforesaid examination of the Finger Print Division of the CFSL, CBI, New Delhi was that the chance prints of accused Vinay Sharma were found on the bus in question. The relevant portion of the report is as under:

Result of Examination

1. The chance print marked as Q.1 is identical with left palmprint specimen of Vinay Sharma S/o Sh. Hari Ram Sharma marked here as LPS-28 on the slip marked here as S.28 (Matching ridge characteristics have been found in their relative positions in the chance palmprint and specimen palm print. This forms the basis of the opinion that these prints are identical. Eight of them have been marked with projected red lines with their detailed description are placed at Annexure-1)

II. The chance print marked as Q.4 is identical with right thumb impression of Vinay Sharma S/o Sh. Hari Ram Sharma marked here as RTS-23 on the slip marked here as S.23 (Matching ridge characteristics have been found in their relative positions in the chance print and specimen finger print. This forms the basis of the opinion that these prints are identical. Eight of them have been marked with projected red lines with their detailed description are placed at Annexure-2)." The above report incontrovertibly proves that accused Vinay was present in the bus at the time of the incident. Be it noted, the other chance prints were found to be unfit for comparison or different from specimen print.

The comparison also shows that there is a concordance in terms of general alignment and angulation of the biting surfaces of the teeth of the lower jaw on the dental models of the accused person with the name Akshay and the corresponding bite marks visible on Photograph No.5. In particular, the comparison revealed concordance between the biting surface of the teeth on the lower jaw of the dental models of the accused person with the name Akshay and the bite mark visible on Photograph No.5 in relation to the rotated left first incisor whose mesial surface pointed towards the tongue.

Overall, the bite mark shows some degree of specificity to the accused person's teeth by virtue of a number of concordant points, including one corresponding unconventional/ individual characteristic. There is an absence of any unexplainable discrepancies between the bite mark and the biting surfaces of this accused person's teeth. Therefore, the teeth on the dental models of the accused person with the name Akshay probably caused the bite marks visible on Photograph No.5."

239. Be it noted, the present is a case where the victim's body contained various white bite marks. Bite mark analysis plays an important role in the criminal justice system. Advanced development of technology such as laser scanning, scanning electron microscopy or cone-beam computed tomography in forensic odontology is utilised to identify more details in bite marks and in the individual teeth of the bite. Unlike fingerprints and DNA, bite marks lack the specificity and durability as the human teeth may change over time.

However, bite mark evidence has other advantages in the criminal justice system that links a specific individual to the crime or victim. For a bite mark analysis, it must contain abundant information and the tooth that made the mark must be quite distinctive.

240. Bite marks in the skin are photographed in cases where the suspect is apprehended. A thorough dental combination is administered after dental examination of the suspect. A final comparison of the details of the original mark with the dentation of the suspect is done by experts.

241. The bite marks generally include only a limited number of teeth. The teeth and oral structure of the accused are examined by experts and, thereafter, bite marks are compared and

reports are submitted. Forensic Odontology is a science and the most common application of Forensic Odontology is for the purpose of identification of persons from their tooth structure.

242. Forensic Odontology has established itself as an important and indispensable science in medico-legal matters and expert evidence through various reports which have been utilized by courts in the administration of justice. In the case at hand, the report is wholly credible because of matching of bite marks with the tooth structure of the accused persons and there is no reason to view the same with any suspicion. Learned counsel for the appellants would only contend that the whole thing has been stage- managed. We are not impressed by the said submission, for the evidence brought on record cogently establish the injuries sustained by the prosecutrix and there is consistency between the injuries and the report. We are not inclined to accept the hypothesis that bite marks have been managed. Acceptability of the plea of alibi

> **Aggravating circumstances**: A court may, however, in the following cases impose the penalty of death in its discretion:
>
> (a) if the murder has been committed after previous planning and involves extreme brutality; or
>
> (b) if the murder involves exceptional depravity; or
>
> (c) if the murder is of a member of any of the armed forces of the Union or of a member of any police force or of any public servant and was committed-
>
> (i) while such member or public servant was on duty; or
>
> (ii) in consequence of anything done or attempted to be done by such member or public servant in the lawful discharge of his duty as such member or public servant whether at the time of murder he was such member or public servant, as the case may be, or had ceased to be such member or public servant; or
>
> (d) if the murder is of a person who had acted in the lawful discharge of his duty under Section 43 of the Code of Criminal Procedure, 1973, or who had rendered assistance to a Magistrate or a police officer demanding his aid or requiring his assistance under Section 37 and Section 129 of the said Code." After reproducing the same, the Court opined: "Stated broadly, there can be no objection to the acceptance of these indicators but as we have indicated already, we would prefer not to fetter judicial discretion by attempting to make an exhaustive enumeration one way or the other.

333. Thereafter, the Court referred to the suggestions pertaining to mitigating circumstances: "Mitigating circumstances.-In the exercise of its discretion in the above cases, the court shall take into account the following circumstances:

(1) That the offence was committed under the influence of extreme mental or emotional disturbance.

(2) The age of the accused. If the accused is young or old, he shall not be sentenced to death.

(3) The probability that the accused would not commit criminal acts of violence as would constitute a continuing threat to society.

(4) The probability that the accused can be reformed and rehabilitated. The State shall by evidence prove that the accused does not satisfy the conditions (3) and (4) above.

(5) That in the facts and circumstances of the case the accused believed that he was morally justified in committing the offence.

(6) That the accused acted under the duress or domination of another person.

(7) That the condition of the accused showed that he was mentally defective and that the said defect impaired his capacity to appreciate the criminality of his conduct." The Court then observed: "We will do no more than to say that these are undoubtedly relevant circumstances and must be given great weight in the determination of sentence."

357. When we cautiously, consciously and anxiously weigh the aggravating circumstances and the mitigating factors, we are compelled to arrive at the singular conclusion that the aggravating circumstances outweigh the mitigating circumstances now brought on record. Therefore, we conclude and hold that the High Court has correctly confirmed the death penalty and we see no reason to differ with the same.

CHAPTER 2

CRIME, CRIMINAL & CRIMINAL INVESTIGATION

SYNOPSIS

2.1 Crime 67
2.1.1 Classification of Crime 68
2.1.2 Causes of Crime 70
2.1.3 Is it crime? 71
2.2 Criminal 71
2.2.1 Who is a Criminal? 71
2.2.2 Identity of a Criminal 72
2.2.3 Classification of Criminals 73
2.3 Criminal Investigation 75
2.3.1 Laws and Rules 75
2.3.2 Investigations 76
2.3.3 The Investigator 77
2.3.4 The Crime Scene 79
2.3.5 People Involved 79
2.4 Criminal Justice System 81
2.4.1 The Legislature 81
2.4.2 The Investigation Agencies 81
2.4.3 The Prosecution Agencies 81
2.4.4 Defence 82
2.4.5 Court 82
2.4.6 Prisons, Reformatories 83
2.4.7 Media 83
2.5 Supreme Court Cases — 21st Century 84
2.5.1 Conviction for murder on Circumstantial Evidence alone 84
2.5.2 Relevant Extracts (Verbatim) 84
2.5.3 Dereliction in Investigation 87
2.5.4 Relevant Extract (Verbatim) 88
2.5.5 Duties of the Court 91
2.6 Additional Case Law 93
2.6.1 Judicial Misuse of "beyond reasonable doubt" 93
2.6.2 Relevant Extracts (Verbatim) 93
2.6.3 Scientific Criminal Investigation 94
2.6.4 Relevant Extracts (Verbatim) 94
2.6.5 Broken Custody Chain; Recovery Doubtful 96
2.6.6 Good Evidence 98
2.6.7 Eyewitness Accounts v Medico-Legal Expert Evidence 99
2.6.8 *Corpus Delicti* 101
2.6.9 Corroboration 102
2.6.10 Third Degree Methods 104
2.6.11 Police Padding 105
2.6.12 Stock Witness 106
2.6.13 Voluntary Confession 107
2.6.14 Trustworthiness of Police 109
2.6.15 Immediate Dispatch 110
2.6.16 Identification Marks 110
2.6.17 Chain of Custody 111
2.6.18 Delay in Dispatch 111
2.6.19 Seals on parcels intact 112

ESSENTIALS OF CRIMINAL INVESTIGATION

1. Criminal Investigation is prerogative of the police. Other official/non-official organisations/individuals also investigate crime.
2. It has two branches: Reactive and Proactive. Former is reaction task to a committed crime. Proactive activity is to pre-empt/control the impending/ongoing crime.
3. It aims to find truth of the incident: Crime? Accident? Self-created fraud (suicide!)/ fake crime or an Act of God.
4. It locates, identifies, arrests, and detains the suspect criminals as per law.
5. It's ideal objectives are to fix *corpus delicti*, if it exists, to locate/identify the culprit/ victim/witness/weapon of offence/*modus operandi*/associates, etc.
6. It recovers looted/stolen money and property.
7. It searches incriminating evidence and hidden valuables, document the recoveries, preserve them, and get them evaluated from experts to prove the guilt of the accused beyond a reasonable doubt.
8. It fixes the location of exchanged connecting clues from all possible sources (the scene, the victim, the culprit, the vehicle used, and the places visited after committing the crime), documenting them, preserving them, and getting them evaluated from concerned experts.
9. It involves interviews/interrogations of the victim/culprits/suspects witnesses.
10. It tends to deter the would–be criminal to commit more crimes.
11. It satisfies the victims of crime.
12. It utilizes services of scientists who use both classical and modern tools and techniques. Computers, Digital Forensics, Forensic Biometrics, DNA profiling, GS-MS spectrometry, and SEM are assisting the criminal investigation in a big way to achieve its objectives.
13. It utilizes criminal profiling and *Modus Operandi* to identify an unknown criminal.
14. It uses informants, undercover agents, wiretapping, and electronic surveillance to reach the criminal and his associates. These tools and techniques have acquired tremendous importance in relatively recent times.
15. It is increasingly using noetic sciences [PDD (Lie Detector), Brain Profiling, and Narco Analysis) for interrogation in place of III Degree Methods of yester years.
16. It utilizes the databases compiled by the police (NCRB in India) for crimes, criminals, and objects for efficient solution of the crime.

2.1 CRIME[1]

Crime, in sociological parlance, is the deviant behaviour of a person *vis-à-vis* the established or accepted standards of behaviour of a society. The deviance is from the social, religious, educational, and political norms of the society. It is time variant and region variant and is affected by the religious beliefs and social practices of the crime affected people.

1. A wit has described crime in a funny way: "**commission of crime is not a crime but being caught for the same is crime**".

Crime, in legal parlance, is an act, which is against the laws of the land. The act adversely affects the victim (a person, a group of persons, or the society as a whole). Usually the element of intension/motive lurks behind the criminal act.

For orderly, normal, and proper societal functioning, the legal concept of crime prevails. It is an act of an individual or individuals that involves breach of the established rules or laws, usually enacted law: national or international laws, or the rules and norms of a functional group, society, or of a community.

The crime as a legal concept varies from country to country, society to society, and even from locality to locality. Some of the examples are:

1. Gay marriage is not an offence in some countries, while in others, it is unlawful at present but there is a move to make them legal.[2]
2. Driving after consuming limited amount of liquor is allowed in certain jurisdiction, not in others.
3. Possession of firearms requires licence in some countries, and not in others.
4. Production of liquor for home consumption is allowed in certain areas of Himachal Pradesh, and not in other parts of the same state.

The concept of crime is time-variant. *Sati* was an honoured custom among the Rajputs in India, in olden days. It is a serious crime today.

Some tribes in Africa and at other places used to abandon their aged relative in jungles where they would die of hunger, natural elements, or were killed by the jungle beasts. It is illegal in most of the societies.

The latest concept of crime is that it is *the violation of human rights.*

2.1.1 Classification of Crime

Crime has been classified in various forms. The common traditional classification divides crime into two main classes:

1. Offences against person
2. Offences against property
3. Crimes against State

In the Indian Penal Code, 1860 the offences have been grouped into chapters.[1] The nature of the crimes and the punishments thereof has been discussed therein. The offences in various Chapters are:

V. Of Abetment
VA. Criminal Conspiracy
VI. Of Offences against the State
VII. Of Offences relating to the Army, [3][Navy and the Air force]
VIII. Of Offences relating to Public Tranquility
IX. Of Offences by or relating to Public Servants

2. In August 2017, a Bench of nine Supreme Court judges pronounce judgment that "**personal privacy**" is a fundamental right. It also indicated that gay marriages also comes under personal privacy.
[1]See Chapters V to XXIII of the Indian Penal Code, 1860.
3. Subs. by Act 10 of 1927, section 2 and Sch I, for "AND NAVY".

IXA. Of Offences relating to Elections

X. Of Contempt of the Lawful Authority of Public Servants

XI. Of False Evidence and Offences against Public Justice

XII. Of Offences relating to Coins and Government Stamps

XIII. Of Offences relating to Weights and Measures

XIV. Of Offences affecting the Public Health, Safety, Convenience, Decency, and Morals

XV. Of Offences relating to Religion

XVI. Of Offences affecting the Human Body

XVII. Of Offences against Property

XVIII. Of Offences relating to Documents and to [4][***] Property Marks

XIX. Of the Criminal Breach of Contracts of Service

XX. Of Offences relating to Marriages

XXA. Of Cruelty by Husband or Relatives of Husband

XXI. Of Defamation

XXII. Of Criminal Intimidation, Insult, and Annoyance

XXIII. Of Attempts to Commit Offences

The first four Chapters discuss definitions and other preliminaries.

The National Crime Record Bureau (**NCRB**), Ministry of Home Affairs, and the Government of India has also classified the crime *via* victimology. The major classes, given by the NCRB, are:

1. Violent Crimes
2. Crime against Women
3. Crime against Children
4. Crime against Scheduled Castes and Scheduled Tribes
5. Property Crimes
6. Cybercrimes

The detailed delineations of the offences and punishment thereof confer legitimacy to the Indian law.

The Indian Constitution proclaims that all are equal before law and the law is the same for all. It has promoted the phrase **"All are equal before the law".** It is a different thing that, in practice, some are more equal than others; of course, through misuse of pelf and power!

The major types of modern crimes, in addition to the traditional crimes, which are proving to be a severe worry to the law keepers and the public are:

1. Terrorism
2. Corruption
3. Money Laundering

4. The words "TRADE OR" omitted by Act 43 of 1958, section 135 and Sch (w.e.f. 25-11-1959).

4. Black Money in Foreign Banks (Secret Accounts)
5. Cybercrimes including internet and computer crimes
6. Misuse of mobile phone
7. Drug Abuse, their illegal manufacture and trade
8. Organised Crime
9. Illegal arms manufacture, trade, and trafficking
10. Juvenile Delinquency
11. Smuggling and drug trafficking
12. Political Crime
13. Public Order Crime

In addition to the above classifications of crime, India has some peculiar crimes that are more or less native to the country. They are:

1. **Honour Killing:** If a young person marries in a caste that is prohibited by the elders, the couple is killed. The Indian law does not permit honour killing and considers such killings as murders. But the *Khap Panchayats*[5] not only approve but also order such murders.
2. **Female Foeticide/Infanticide**: A number of social evils are responsible for female foeticide. Religious demands for a male issue, to continue the lineage, dowry requirements at marriage, and inability to find suitable boy for the girl are some of the major reasons for female foeticide. Additionally, the sex-determination test during pregnancy has facilitated foeticide. Quite a few private clinics carry out the test illegally and help pregnant woman to abort the foetus. The law is against both the tests and the abortions, nevertheless both are flourishing unabated.
3. **Dowry Deaths**: Many bridegrooms and their parents expect the parents and the relatives of the bride to give substantial dowry to the groom and his kith and kin. If the dowry is below their expectations, they start pestering the bride, some murder the bride while others force them to commit suicide.

   There are stringent laws against dowry deaths. However, they are ineffective and the evil continues.

2.1.2 Causes of Crime

There are many causes of crime. They are people variant and time variant. In olden days, the main causes of crime were grouped in three categories, all starting with **'Z'**:

1. Zun (woman)

The women, in olden days, was a potent source of crime in most of the societies. Adultery, rape, kidnapping and their possession were the cause of many a crime including wars (Allauddin-Padmini!).

2. Zamin (land)

Land was the main source for subsistence in olden days and land disputes often arose which sometimes led, even today, to murders. It is a historical fact that the fertile Indo-Gangetic plains of India have attracted invaders time and again in the past.

5. A self-styled panchayat of the village elders. They decide Honour killings.

3. Zar (Property: money, jewellery and valuables)

Zar had been beckoning and still beckons many evil minds for a variety of crimes. Theft, robbery, dacoity, kidnappings for ransom, smuggling and trading in narcotics, illegal arms trade are crude heinous crimes of the muscleman. However, the educated has gone to collect hundreds of crores of rupees through forgeries, frauds, counterfeiting currency (even stamp papers!) and trading in spurious or imitation products to rake in crores of rupees. Cuts and commissions for business and other favours have been filling the coffers of the bigwigs (political leaders, administrators, and business men) in no uncertain terms. They are raking in the tainted **Zar** and have stashed lakhs of crores of rupees in foreign bank coffers in secret bank accounts, identified by only numbers!

Other important causes of crime are:

1. Lust for power: Political crimes (political murders, grabs, scams, bribes (corruption), quotas, subsidies, promoting families, and kith and kin).
2. Religious fanaticism.
3. Revenge for real or imaginary insults, humiliations, and the like.
4. Disparity [economic, social], hunger versus lavish wastage.
5. Psychopathy (inborn mental emotional imbalance and aberration): Sex maniac, serial killers, kleptomaniac, schizophrenics, and the like.
6. Honour killing.
7. Provocations.
8. Nurture (environment, association, differential treatment, personal, familial, and social disorganisation).
9. Loss of faith in God's dispensation and in religious teachings.
10. Change in social values.
11. Rise of subcultures, rise of terrorism, and *fidayeen* (suicide squads).

The knowledge relating to the causes of crime and their control is important. They form important investigative and research fields with the psychologist and the sociologist. A lot of research work goes on to understand the problems and find effective preventive, detective, and remedial measures for the same.

2.1.3 Is it crime?

A crime is usually discriminated from accidents, act of God, suicides. It is identified from:

1. The presence of *corpus delicti* of the crime; it varies tremendously, depending on the nature of a crime and the *modus operandi* of the criminal. For example, in an alleged murder, the dead body is the *corpus delicti*. In explosions, the presence of explosive or its decomposed fragments are the *corpus delicti*.
2. The information furnished by genuine eyewitnesses.
3. The appraisal of the circumstantial evidence.

2.2 CRIMINAL

2.2.1 Who is a Criminal?

"Who is criminal?" It is a simple question in common parlance. Any person who commits a crime is a criminal. In legal terms, it becomes complicated. In law, a person committing a crime

is not a criminal unless a court finds that the evidence produced proves that he has committed a crime beyond reasonable doubt and the judge declares him a criminal. The person is just a "suspect" or an "accused" until a judge pronounces him a criminal. The police suspects an individual(s) for committing a crime; investigates the crime to identify the criminal (and the victim sometimes); to find evidence against the suspect; and to dub him as an "accused". If the police find sufficient evidence against suspect/culprit, it goes to the court with the evidence. The court decides whether the evidence produced by the prosecution is sufficient to identify him as a criminal beyond any reasonable doubt and the accused is then a criminal. If the evidence is insufficient the accused or the suspect is innocent. Thus, most of the criminals continue to be "non-criminals" legally. Only legal identification/conviction/punishment of the accused for his criminal act brings him to the epithet of a "criminal" in legal terms.

2.2.2 Identity of a Criminal

Identifying the criminals and linking them with crime are the major tasks in a criminal investigation. The following pieces of evidence help to identify the criminal:

1. Confession of a culprit that he/she committed the crime attributed to him/her.
2. The eyewitnesses who saw him/her committing the crime at the crime scene, identifying the culprit.
3. The victim identifying the culprit.
4. *Portrait Parle*, Artist's sketch, Identity Kit Sketch, or Photofit photograph built on the description given by the eyewitness help to identify the culprit.
5. Interrogation of the culprit (and the victim) through lie detector/narco-analysis/ brain profiling often help to identify the culprit.
6. Forensic biometrics help to identify a culprit.
7. Cells from human body parts is a deciding clue that helps in identifying the culprit, beyond reasonable doubt. The culprit can leave them at the scene, with the victim, on the discarded weapon of offence, on the route, or in the vehicle used in the commission of crime. It facilitates the identification of the culprit.
8. Evidentiary clues that the culprit picks up from the scene, from the victim, from the discarded weapon of offence or from the vehicle used in the commission of crime may indicate his identity.
9. Circumstantial evidence is potent mode leading to the identity of the criminal.
10. Acts of commission and omission and behaviour of the suspect after committing the crime may give out his identity.
11. Motive(s) is a powerful indicator of the complicity in the criminal act. They point the needle of suspicion towards the culprit.
12. The post-incident activities of the culprit (to hide the crime, to extricate himself, and to make unavailable) are potent indicator of the involvement of the person.
13. The recovery of valuables or other entities belonging to the victim are strong proofs of his complicity in the crime.

The investigating officer(s) interrogates the subjects, locates the clues, collects them, get them evaluated, and collates the total evidence to identify and link the suspect with the crime. He often procures experts' help in these processes.

Forensic Science assists the IO to identify the culprit and to link him with the crime.

2.2.3 Classification of Criminals

The classification of criminals is somewhat complicated. However, for general understanding the following types are considered:

1. **Violent Criminals:** They commit crime against a person. Sexual offenders, kidnappers, murderers, dacoits, robbers, religious fanatics, and terrorists are some types of violent criminals.
2. **Public Order Agitators:** They include terrorists, anarchist, revolutionaries, political agitators, *Coup d'état* promoters, and others trying to overthrow the government in power.
3. **Fraudsters:** Include a variety of con artists. Forgers, impersonators, cheats, chain business promoters, commercial and financial fraudsters, spurious substitute drug manufacturers, patent, and copyright violators.
4. **Narcotic drug** smugglers, peddlers, traders, and manufactures.
5. **Firearms** and ammunition smugglers.
6. **Narcotics traders** manufacturers/smugglers/stockiest/distributors/peddlers.
7. **Fake currency dealers** or prohibited currency dealers and spurious currency printers.
8. **Perjurers**: They are stock witnesses, persons who switch evidence and those who "pad" evidence to "strengthen cases".
9. **Juvenile Delinquents:** They are those criminals who have not acquired adulthood. They commit all sorts of crimes. Sex crimes, crime against property, rioting, and agitations are their favourite crimes. August 2011 riots, in London and other cities of England, were rather a revelation to the shape of things to come *via* juvenile delinquency.
10. **Cybercriminal:** A new class of criminals have emerged who carry out computer and cybercrimes.

Law deals with the delinquent juveniles rather leniently in the hope of bringing them back to normal stream of life.

The criminals are also classified on the basis of their entry into the criminal world. Thus we, have:

1. **Chance Criminal**

   The chance criminal is one who prior to the commission of the act had no intention to commit the crime**.** Accidental discharge of a gun, injuring, or killing someone makes the shooter a chance criminal. Likewise, in a road accident damage to the vehicle or injury to a person is not intentional. The person responsible for the accident is a chance criminal.

2. **Provoked Criminal**

   Here the crime is committed due to a sudden provocation. Prior to the occurrence the culprit had no intention to commit the crime. But sudden provocation, verbal, or through some action on the part of the victim brought in reaction in the form of the given crime.

3. **Pre-planner**

   The criminal in this category preplans the crime. Dacoities and kidnappings are the aftermath of proper planning. Most of the murders are also planned murders.

4. **Recidivist**

   A recidivist is a criminal who has been convicted once (or more times) and has again started committing the crime. It is believed that association with the hardened criminals in the jail promotes emergence of recidivists.

5. **Professional**

   A criminal is a professional if he has adopted crime as a profession. There are many types such as: Professional killers, arsonists, forgers, fraudsters, and burglars are some of them.

6. **Mentally Sick Criminals**

   Some criminals who commit a crime are mentally ill. Sex maniacs, serial killers, fanatic murderers, and kleptomaniacs are glaring examples of such criminals.

7. **Crime Syndicates**

   Organised crime syndicates are found in every country. A number of criminals combine forces and carry out criminal activity conjointly.

8. **Shady Go-getters**

   Bigwigs, politicians, bureaucrats, businesspersons, and especially the politicians are often the ones to decide big deals where stakes are high. The interested parties almost invariably offer fantastic amounts as grease money. Quattrocchi of Bofors infamy is a well-exposed notorious example.

9. **Religious fanatics**

   Religious fanatics who spread hate among the sections of different faith/religions/sects.

10. **Political fanatics**

    They are anarchists who spread chaos in a country.

11. **Money launderers**

    They are magicians. They churn "black money" and produce "white money". Safe transformation of black money is a major crime. They receive black money and change it to white money, on commission basis. They usually have foreign partners or local Hawala[6] people to accomplish the task.

    The increasing corruption in all businesses has increased the quantum of black money manifolds. Quattrocchi cooked up hundreds of crores of rupees as grease money in Bofors Gun case. It was thought to be a big amount, but it pales into insignificance when we are faced with the loot of thousands of crores of rupees in Common Wealth Games (2010), coal auctions, 2G Telecom scam, and other super *Ghotala* (fraud) games.

    The converted black money so obtained stands stashed in the offshore banks as white money.

6. Money launderers.

2.3 CRIMINAL INVESTIGATION

Why Investigate?

1. to find the truth about the occurrence
2. to identify the culprit/victim/witness
3. to guess/locate/dig/collect linking physical evidence
4. to link physical evidence with the culprit/victim/SOO/WOO/*modus operandi, inter se*
5. to interrogate the victim/culprit/witnesses to ascertain truth
6. to provide crime data to the expert (instrumental Interrogation) and to get disclosure statement
7. to coordinate the work/evidence of the various specialists/experts
8. to know the prosecution/defence/real version
9. to collect intelligence about the criminal/victims/their associates
10. to collate the total evidence to make the case a connected whole
11. to establish, *inter se,* consistency of the total evidence
12. to ensure sufficiency of evidence for proof "**beyond reasonable doubt**"
13. to file charge sheet under section 173 of CrPC with relevant documents

"Search with dedication; ye shall find"

Criminal investigation starts with the understanding of the nature of the crime and the psychology/motive of the criminal for effective results. The task is multifarious in most of the cases. The investigating officer often needs the assistance of a number of specialists, as he cannot carry out the work single-handed.

2.3.1 Laws and Rules

Criminal investigation functions as per the laws laid by the legislature (Parliament and the state legislatures). The laws need modifications at times. Parliament/legislatures enact the needed amendments.

The laws are codified to ensure uniformity in the dissemination of justice and to reduce the personal element in their interpretation.

There are three main Codes, which largely deal with criminal investigation and trials:

1. *The Criminal Procedure Code*, 1973. The Criminal Procedure Code became effective w.e.f. 1 April 1974. It has been amended from time to time to meet the current and on-coming needs.
2. *The Indian Penal Code*, 1860. The Indian Penal Code delineates the nature of the various offences and the punishments they attract. The offences have been grouped into various categories in the Code[7] to discuss the nature of the offences and their punishments logically. The Code has been amended from time to time.

7. See Chapters V to XXIII of the Indian Penal Code, 1860.
This book discusses most of the investigative aspects of crime that need scientific inputs. The discussions are concise, precise and hopefully comprehensive.

3. *The Indian Evidence Act*, 1872. The Indian Evidence Act defines and consolidates the law of evidence in India. Its jurisdiction is for all judicial proceedings before any court in India, excluding Jammu and Kashmir. It specifies the varied nature, the mode of production of the evidence in a civil or criminal case, and the value of the evidence produced by the prosecution for or against an accused.

Some controversial issues come up on some sections of the Codes, now and then. The Supreme Court and the High Courts interpret the correct position of the laws and its applications, in the form of case law, relating to the controversies that come up in the trials and give the correct interpretation of the involved law.

These three Codes help in the smooth functioning of the criminal justice system in India.

In addition, there is a plethora of Laws and Acts, which deal with specific law issues like the *Information Technology Act*, *Marriage Act*, *Money Laundering Act*, and the *Arms Act*. They are also amended from time to time to meet the emerging/changing needs of the society.

The superior courts oversee the laws in action to ensure that the functioning does not cross the constitutional limits.

2.3.2 Investigations

Once the existence of a crime is established, the assigned investigating officer (IO) starts investigations. Criminal investigation plays a pivotal role in criminal justice system to maintain law and order in a society. It helps to establish *corpus delicti.* It identifies the culprit/his associate/victims/witnesses. It finds evidence to link the criminal with the crime and ascertains the innocence of the innocent. It indicates the *modus operandi*, the motive, the weapon of offence, the nature of the vehicle used, the time of the incident, the disposal mode/sites of the incriminating entities, and valuables. It provides leads and the *modus operandi*.

Criminal investigation is simply collecting total evidence about a criminal act to find answers to many questions including the following:

1. Is the incident in question really a crime or a deceit?
2. Where is/was the *corpus delicti*?
3. Has the *corpus delicti* been identified beyond a reasonable doubt?
4. What is the motive behind crime?
5. Who are the victim(s)/culprit(s)/witness(s)?
6. Are the identities of the alleged criminals/victims genuine or false?
7. Where is the crime scene(s)?
8. Is the alleged scene real or phony?
9. When was the crime committed?
10. What is the evidence against the culprit: Physical/Oral/Circumstantial/Scientific?
11. What was the motive behind the crime?
12. Is the culprit really insane or professing insanity as defence?
13. What was the *modus operandi*? What are his routes of ingress/egress/point of entry? How did he enter the site?
14. Are the various pieces of evidence (physical clues/eyewitness accounts/circumstantial including scientific evidence, confession and statements of the culprit/approver) consistent *inter se*?

15. Is the time element of occurrence consistent with time of the other events involved in the crime?
16. Is the evidence involved in the case real or false?
17. Are the witness/victim/culprit telling the truth or perjuring?
18. Which are the hiding places of the culprit, valuables, *corpus delicti,* or evidence?
19. Who are the accomplices of the culprit?
20. What did the culprit(s) do after committing the crime?

Police is the main organisation to investigate a crime. Some persons employ private investigators also. The police and other investigators find answers to the above questions: establish *corpus delicti*, identify the culprit, locate, collect, preserve, evaluate (or get evaluated) evidentiary clues, and collate the total evidence: oral and circumstantial, including physical evidence to link or de-link a suspect with the crime beyond reasonable doubt.

The police investigators are police officers of varied statuses, appointed by the government. All of them have a common title, **I**nvestigating **O**fficers (**IO**). They use the departmental facilities including, computerised data, network of intelligence, which keeps them informed about the activities of the bad characters/criminals and their movement at material times. They also are kept in the loop of the prevailing criminal environment, the likely explosive situations and happenings, which can lead to crime.

2.3.3 The Investigator

Major tasks of the investigating officers in the investigation of a crime are to:

1. Provide medical assistance to the injured person(s).
2. Examine the scene of occurrence, guard it, document it, assess, and procure the needed help (expert or otherwise) for the examination of the scene.
3. Locate, collect, and preserve the evidentiary clues from the scene, and maintain their integrity, authenticity, and continuity of the chain of possession.
4. Ascertain the possible culprit(s) and arrest him immediately.
5. Detain the witnesses and interrogate them individually.
6. Detain the associates of the culprit/victim if they were present at the crime scene.
7. Get post-mortem of the deceased done.
8. Get the evidence evaluated from the specialists (Forensic Scientists!) concerned.
9. Collate the total evidence (oral evidence, circumstantial evidence, medico-legal evidence, forensic, and other expert evidence).
10. The task of an investigating officer is tough and taxing. He has to be:
    - Intelligent to anticipate/understand manipulation of the criminal and his *modus operandi.*
    - Physically fit and mentally alert, to guard against the sudden attack of criminals.
    - Know-all (*Hamadan*) person, to know investigation techniques, human psychology to understand the mental working and behaviour of the men involved.
    - Conversant with law, so that, during his investigations, he does not trespass the legal barriers or infringe human rights.

- He has to be a go-getter to get cooperation of the various individuals including that of the culprit(s) and his near and dear ones.

Fig. 2.1
IO finds answers to the above questions

In short, he has to be a superhuman with ideal attributes (given in the box below):

Ideal Attributes of an IO

1. Well-educated, trained, and experienced and should constantly update his knowledge.
2. Mentally and physically healthy
3. Emotionally stable and fearless
4. Intelligent: sound intuition and logical judgment
5. Public relations: co-operative and cooperation seeker/getter
6. Believer in teamwork
7. Motivated and dedicated
8. Persistent, objective
9. Keen observer
10. Person of high integrity
11. Possesses excellent communicative skill
12. Knows, respects, and believes in law of the land and works within the limits of law
13. Uses modern techniques for investigation and for handling men, materials, and situations
14. Knows (and uses) scientific methods of investigations and their potentialities/limitations
15. Understands human psychology: what ticks a person and what are the failings
16. Absolutely dependable/reliable
17. Able to take decisions

It is a tall order; but Central! Mandatory!!

2.3.4 The Crime Scene[8]

It is said that the success/failure of criminal investigations starts and ends at the crime scene. Handling a crime scene brooks no delay. The IO must use his subordinates to reach the scene of occurrence on receipt of information that a crime has been committed in his jurisdiction. He may send his deputy if he himself is entangled in some other case. On arrival, the first police officer takes care of the injured, guards the scene, preserves the transient evidence, assesses the processing needs of the scene, and informs the superiors.

The IO takes over from the first police officer as soon as possible and handles the situations after prioritisation of various tasks.

The systematic handling of the crime scene situation is discussed, in detail, elsewhere.[9]

2.3.5 People Involved

The men involved in a crime are the criminal(s), the victim(s), the witnesses, and the on-lookers at the scene. The first police officer at the scene expels all the onlookers from the scene. He arrests the identified and available culprit(s). He segregates the witnesses, and the culprits; and later, after processing the crime scene, interrogates all the persons thoroughly who know something about the crime.

Forensic Psychologists assist the IO in the interrogations.[10]

Various types of scientific experts are helping the investigator in his/her investigational activities increasingly. In fact, a societal sea change is making the scientific methods of investigations indispensable. They are not costly in terms of the total cost of the investigation and trials. Governments are encouraging the changeover because non-scientific investigations are increasingly bringing in investigative failures and hence, the public wrath. The following forensic specialists help:

1. **Crime Scene photographer and videographer:** He documents/records the scene and makes it mobile. Even the judge can ”visit“ the scene in the courtroom. He records the nature and position of the evidence also, which can help to reconstruct the crime correctly.
2. **Medico-legal Expert:** He deals with the dead and the injured. He ascertains death, the cause of death, the time of death, and a lot of other relevant information especially about the identity of the victim and personality of the culprit. His report is a great help in the reconstruction of the events of the occurrence.

   He also collects evidence and evidentiary clues from the dead/injured persons.
3. **Forensic Specialist**: He is an all-rounder expert. He is indispensable and should be associated with most of the criminal investigations, whenever possible.
4. **Miscellaneous Experts:** Other experts who help the criminal investigation are Fingerprint Experts, Explosives Experts, Arson Investigator, Civil/Mechanical Engineers, and the like.

8. For details See Chapter 5.
9. *Ibid.*
10. See Chapter 30 on “Forensic Psychology”.

In short, forensic science has travelled a long journey. It is now capable to assist criminal investigation in a big way. It helps to:

1. Establish *corpus delicti*.
2. Interrogate suspects, victims, and even witnesses to get at the truth. Hypnosis, Psychological Detection of Deception (lie detection), Narco-analysis, and Brain-Printing have revolutionised police interrogation by saving time, money and effort, and providing far superior results. The scientific methods used in interrogation have made the interrogation humane and legal, and have created possibilities for eliminating the notorious III–degree methods; which sometimes recoil and proved disastrous.
3. Fix the identity of a culprit/victim/witness beyond a reasonable doubt. Fingerprints have been serving criminal investigation for more than a century now for definite identity of the subject. However, DNA profiling has brought the real revolution in the last three decades. The identity of any person can be fixed from the tiniest body material, even from a single hair shaft or root. The culprit is bound to leave his body material almost invariably, at the scene. Rapists, even in a gang rape, can be identified individually without mistake!
4. Link the culprit with the victim, scene, weapon of offence, and vehicle used in the crime.
5. Reconstruct the sequence of events.
6. Verify prosecution/defence versions.
7. Inter-link serial crimes.
8. Provide leads to the criminal.
9. Indicate the sources/locations of evidence.
10. Delink the innocent accused from the crime.

Scientific criminal investigation has arrived indeed. Forensic science facilitates its task in its varied facets, plays a pivotal role in maintaining law and order, and preventing crime.

In short, criminal investigations and forensic science have become inseparable partners and can never be parted.

Supreme Court Guidelines on Investigation[11]

(i) Proceed to the spot (immediately);

(ii) Ascertain the facts/circumstances of the case;

(iii) Discover/arrest of the suspected offender;

(iv) Collect evidence relating to the offence, which may consist of:

- **(a) the examination of various persons (including the accused) and recording their statements,**
- **(b) the search of places /seizure of objects considered necessary for the investigation/production at the trial;**

(v) Formation of the opinion as to whether the material collected makes a case to place the accused for trial. If so, taking necessary steps for the same; by

(vi) Filing of a charge sheet under section 173 CrPC before the competent court.

11. *HN Rishbud v State of Delhi*, AIR 1955 SC 196 : 1955 (1) SCR 1150.

2.4 CRIMINAL JUSTICE SYSTEM

Every organised society has a system to prevent breach of law, to enforce laws, to handle lawbreakers, and assuage the victims so that the individual and the society has confidence in its criminal justice system that it will protect them and punish the culprit. Further, the system is bound (Constitution) to bring the criminals on the right path through psychological treatment, education, and job therapy. Only then, the society or the country can function smoothly and its members or citizens live without fear and work peacefully. The management of crime, framing of laws, law enforcement, and handling the aftermath of the law enforcement processes is collectively criminal justice system. The main aim of an efficient criminal justice system is "to enforce the specified standards of conduct, rules and laws" by:

1. Reducing crime
2. Ensuring real justice in a criminal case, to all, including the culprit and the victim
3. Dispensing exemplary punishment to the criminal, so that it acts as a deterrent to all criminals and fence sitters
4. Assuaging the victim or his kith and kin. They must feel that justice is done.
5. Providing him needed protection from the criminal and financial assistance and other help.
6. Creating confidence among the public that the system works and it would protect them

The criminal justice system generally has the following wings:

2.4.1 The Legislature

It frames laws.

2.4.2 The Investigation Agencies

The police and other law enforcement agencies detect crime, investigate crime, and find proof to link the crime with the criminal and prevent crime.

2.4.3 The Prosecution Agencies

Once the criminal investigations are complete, the IO submits the total evidence to the prosecution branch through a challan. Public prosecutor, a government advocate, of a specified court(s) represents the prosecution. The Public Prosecutors are also known as district assistant/district attorneys. They appraise the evidence. If they find some lacunae, they ask the IO to remove them. They process the trials and ensure that:

- The located, collected, preserved, evaluated, and presented evidence is relevant, authentic and its integrity and its identity are beyond reasonable doubt.
- The evidence produced is legally sound.
- The total evidence is adequate to prove the case beyond reasonable doubt
- The total evidence (the eyewitnesses' accounts, the circumstantial evidence, the medico-legal evidence, and the evidence of the experts) is consistent, *inter se*.

- The total evidence is adequate to prove the linkage of the criminal with the victim, the scene, and the weapon of offence beyond a reasonable doubt.
- The presentation is adequate, orderly and intelligible. The submission is well-illustrated, fortified by data **and** presented in simple, precise, and concise language and leads to only one conclusion that is given the report.
- The total evidence produced brings out "the truth, the whole truth and nothing but the truth".
- The total evidence leads to one and only one conclusion, that of the prosecution
- They specify the law infringed and present evidence to prove the guilt of the accused/suspect/criminal in the court.
- The evidence is logical and convincing.

2.4.4 Defence

The accused person has the right to defend himself. He can engage an advocate to defend him. If he cannot afford the advocate's fee, the court appoints Amicus Curiae (lawyer) to defend him.

A defence counsel guards the interest of the accused. He tries to find the real or imaginary lacunae in the evidences to obstruct/prevent the court to accept the prosecution evidence.

2.4.5 Court

It adjudicates, appraise the appropriateness of the law *vis-à-vis* the crime, the adequacy, and correctness of the evidence produced and the demeanour/performance of the witnesses. The judge bases his verdict on the proof submitted by the prosecution or the defence. The evidence should prove the thesis beyond a reasonable doubt.

The judge is legally qualified and trained in adjudication. He tries the accused of the alleged offence as per specified law.

There is a regular hierarchy of the Judges. It is:

1. Judicial Magistrates,
2. Chief Judicial Magistrates,
3. Sessions Judges,
4. High Court Judges, and
5. Supreme Court Judges.

There are sometimes special courts to do judicial work. They are created for specific purpose. Lokpal and lokayukt (who examine cases against politicians and bureaucrats) and military courts (Courts Martial) which try military offenders.

There are still other courts but they do not handle criminal cases. They are special courts handling only specifically assigned category of cases. Thus, we have various types of tribunals: Administrative Tribunal, Tax Tribunal, Debt Recovery Tribunal, and so on. Even panchayats[12] carry out certain judicial functions.

12. Elected members from village(s) constitute a Panchayat, which has been empowered by law to adjudicate minor cases of the area they represent.

The judges ascertain the validity of the charges and adjudicate whether the evidence produced against the accused is truthful, legal, properly presented, and sufficient to prove the alleged guilt beyond reasonable doubt so that no innocent person suffers though a culprit may get acquittal — on benefit of doubt or otherwise. The judges often adhere to the *dictum*:

100 culprits may escape punishment but one innocent person must not get punished.

The judge is assisted by government and defence counsels to record and assess the evidence. He may also request expert help when he feels that there is need for the same.

The judges critically appraise the total evidence produced, both by the prosecution and the defence. In short, he ensures that adequate evidence is tendered which prove the charge framed against the accused. The judge then convicts/punishes him in accordance with the law, court conventions, and judicial precedents.

2.4.6 Prisons, Reformatories

Convicted persons are punished. The highest punishment is death sentence. However, it is awarded in the rarest of the rare cases. Usually the convict undergoes imprisonment for various periods, with or without fines, depending upon the nature of a crime. In some cases, only fine meets the ends of justice.

Juvenile criminals are punished leniently. They are often sent to reformatories or correctional homes. They are also kept under watch.

The prisons, reformatories, and juvenile houses are the places where the convicts with prison sentence are kept. The prison authorities handle the convicts during their conviction period. The government has introduced many programmes to make the prisoners good citizens and to bring them back to the society as normal citizens.

Punishment to the criminals is mainly intended to deter criminals, to prevent recidivism, to induct restitution, to assuage the victim or his or her kith and kin, and to reform the criminal. Many institutions cater to the punishment process. Jails, juvenile homes, reformatories, restricted movements, and periodic reporting to the police are well-known institutions to achieve the end. Psychologists, religious mentors and Yoga Gurus provide the new approaches to cure the criminal of the criminal behaviour under the concept that crime is a disease. Work therapy is used extensively to change the behaviour of the criminals. Forensic Psychology[13] is being used increasingly to handle the punishment aspects of the system to achieve maximum societal benefit with minimal harm to the culprit, the victim and the society.

2.4.7 Media

The media has no legal role in the criminal justice system. However, in recent years it is exercising tremendous influence on criminal trials. They often influence the verdict; earning the epitaph for the influence:

"Trial by Media" or "Media Trial"

Often, the moneybags and the influential bigwigs are able to hoodwink the law by buying the witnesses, by destroying (or replacing) the evidentiary clues, and sometimes even by bribing the judge. Media often jumps into the arena in important cases and influence the court decision, usually leading to correct verdict.

13. See Forensic Psychology, Chapter 30.

2.5 SUPREME COURT CASES — 21ST CENTURY

2.5.1 Conviction for murder on Circumstantial Evidence alone[14]

Author's Summary

It is a case of murder. The culprit brought a female with him to Delhi, stayed in a hotel, killed her and left her body in the hotel and vanished from the scene. There were no eyewitnesses to this heinous crime at Delhi. He was convicted on circumstantial evidence. Supreme Court maintained the conviction. It did not accept the defence objection to such conviction. Supreme Court also laid the following law, with support from other similar cases:

1. **"the Courts will be well-advised in case of circumstantial evidence to be watchful and to ensure that conjectures and suspicions do not take place of legal proof.**
2. **"it is well-settled that those circumstances must be proved to be such as to be conclusive of the guilt of the accused and incapable of explanation on any hypothesis consistent with the innocence of the accused.**
3. **"Modern thinking is in favour of the view that proof beyond a reasonable doubt is the same as proof which affords moral certainty to the Judge."**

Highlights italicised

2.5.2 Relevant Extracts (Verbatim)

The learned Senior Advocate, Mr. Jaspal Singh, has been able to state the proposition of law with due clarity. It has been contended that in the event of there being only circumstantial evidence, it is well-settled that those circumstances must be proved to be such as to be conclusive of the guilt of the accused and incapable of explanation on any hypothesis consistent with the innocence of the accused. It has been contended further that it is on this score the law seems to be well-settled as well, to writ that the Courts will be well-advised in case of circumstantial evidence to be watchful and to censure that conjectures and suspicions do not take place of legal proof. It has been the appellant's contention that the prosecution has utterly failed to link up the chain and as a matter of fact the snap in the chain is not very far to seek, thus warranting an order of acquittal and the High Court has fallen into a manifest error in regard thereto. The evidence of PW-1 and PW-23 being Madan Singh and Dinesh Chand was taken recourse to. It is on this score, it has been contended that (a) None of them has identified the appellant; (b) None of them has stated the it was the appellant who had checked in on 18-9-1991; (c) None of them has stated that it was the appellant who had checked out on 19-9-1991 at 8.30 a.m.; and (d) Rather both the witnesses have stated that appellant was not the person who had checked in on 18-9-1991 or who had checked-out in on 18-9-1991 at 8.30 a.m. and drawing inspiration therefrom, Mr. Singh in support of the appeal contended that there is thus no direct evidence available to prove that it was the appellant who had checked in on 18th September, 1991 or had left the hotel on 19th September, 1991. Admittedly, there is no difficulty in appreciating the submissions of Mr. Singh. Availability of direct evidence is not there but what about the circumstances? Before doing so, be it noted that the evidence of PW-6, Sahmim Bano as to the date of departure of the accused with his wife Hazra *alias* Halima from Bombay to Delhi and the subsequent telephonic message that Halima died in

14. *State of Madhya Pradesh v Sanjay Rai,* AIR 2004 SC 2174 : 2004 AIR SCW 1919 : 2004 Cr LJ 2006 (SC).

a bus accident and that cremation has taken place in Nizamuddin stand out to be a rather significant component of the chain of evidence.

(a) The appellant came to visit Delhi along with his wife Hazra *alias* Halima leaving Bombay on 17th September, 1991.

(b) On 18th September, 1991 at about 8.50 p.m. both of them claimed to be husband and wife. Alamgir, appellant entered his name and address in the guest register and received key of Room No. 107 and stayed in Room No. 107 in Royal Inn Guest House, Netaji Subhash Marg, Daryaganj, Delhi.

(c) On 19th September, 1991 in the morning at 8.30 a.m., Alamgir left the guest house locking his wife in the room and did not return thereafter.

(d) The appellant telephonically informed PW-6, Shamim Bano that the deceased died in a bus accident and was buried in Nizamuddin and thereafter the appellant left Delhi for Bombay.

(e) The appellant's wife was found dead due to strangulation in Room No. 107 on opening of the same with duplicate key on 20th September, 1991.

(f) The appellant was arrested at Bombay on 21st September, 1991 and key of the room was recovered from him along with ticket from Delhi to Bombay dated 19th September, 1991 proving that he after killing his wife instead of taking her care, had left for Bombay on 19th September, 1991. Only beyond the range of a reasonable doubt, of course, the expression 'reasonable doubt' is incapable of definition. Modern thinking is in favour of the view that proof beyond a reasonable doubt is the same as proof which affords moral certainty to the judge.

The question for consideration is thus as to whether the circumstances noticed above would form a complete chain of events without any snap and pointedly point to the accused as the guilty person and to no-one else. In the event there is an answer in the affirmative, question of interference with the order of the High Court would not arise. Incidentally, the High Court did emphasize on the true and correct meaning of the phraseology 'reasonable doubt' to be attributed thereon and it is on this score, the High Court records:

> *Modern thinking is in favour of the view that proof beyond a reasonable doubt is the same as proof which affords moral certainty to the Judge.*

We are, however, not expressing any opinion with regard thereto. Suffice it to say that sufficiency of moral certainty itself is a matter for deliberation and since the matter has not been addressed to us on that score, expression of opinion on the same would not arise.

The circumstances noticed above, if read with the evidence of PW-6, Shamim Bano as to the date of departure of the accused with his wife Hazra *alias* Halima from Bombay to Delhi and the telephonic message after two days that Halima had died in a bus accident and that she had been cremated at a cremation ground in Nizamuddin – this piece of evidence, as noticed above, if read along with the circumstances noticed above, would form a chain without there being any snap. Strenuous submissions have been made as regards the admissibility of the Handwriting Expert's opinion as also a challenge thrown to the non-admissibility of the entire evidence of Shamim Bano, PW-6. This evidence of Shamim Bano has been challenged on two counts: on the first Shamim Bano, being the sister of Halima, was an interested witness and secondly, she did not say so in a statement before the police under section 161, Cr. P.C. Interested witness by itself cannot

possibly be a ground to reject the evidence on record. The test of creditworthiness or acceptability, in our view, ought to be the guiding factor and if so, question of raising an eyebrow on the reliability of witness being an interested witness would be futile in the event of the evidence being otherwise acceptable, there ought not to be any hindrance in the matter of prosecutor's success. The evidence must inspire confidence and in the event of unshaken credibility, there is no justifiable reason to reject the same. It is on this score the issue of interested witness thus stands negated, as raised by the appellant. The second limb pertains to the statement under section 161, Cr. P.C. Admittedly, the piece of evidence was not available in the statement of the witness under section 161, Cr. P.C., but does it take away the nature and character of the evidence in the event there is some omission on the part of the police official. Would that be taken recourse to as amounting to rejection of an otherwise creditworthy and acceptable evidence—the answer, in our view, cannot but be in the negative. In that view of the matter, the evidence of PW-6 thus ought to be treated as creditworthy and acceptable and it is to be seen the effect of such an acceptability.

Similarly, however, the opinion of this court in *Pawan Kumar v State of Haryana*,[15] in which one of them (UC Banerjee J), was a party. The opinion of the court runs as under:

Incidentally, success of the prosecution on the basis of circumstantial evidence will, however, depend on the availability of a complete chain of events so as not to leave any doubt for the conclusion that the act must have been done by the accused person. While, however, it is true that there should be no missing links, in the chain of events so far as the prosecution is concerned, but it is not that every one of the links must appear on the surface of the evidence, since some of these links may only be inferred from the proven facts. Circumstances of strong suspicion without, however, any conclusive evidence are not sufficient to justify the conviction and it is on this score that great care must be taken in evaluating the circumstantial evidence. In any event, on the availability of two inferences, the one in favour of the accused must be accepted and the law is well-settled on this score, as such we need not dilate much in that regard excepting, however, noting the observations of this Court in the case of *State of Uttar Pradesh v Ashok Kumar Srivastava*, AIR 1992 SC 840 : 1992 AIR SCW 640 : 1992 Cr LJ 1104, wherein this Court in paragraph 9 of the report observed:—

This Court has, time out of number, observed that while appreciating circumstantial evidence the Court must adopt a very cautious approach and should record a conviction only if all the links in the chain are complete pointing to the guilt of the accused and every hypothesis of innocence is capable of being negatived on evidence. Great care must be taken in evaluating circumstantial evidence and if the evidence relied on is reasonably capable of two inferences, the one in favour of the accused must be accepted. The circumstance relied upon must be found to have been fully established and the cumulative effect of all the facts so established must be consistent only with the hypothesis of guilt. But this is not to say that the prosecution must meet any and every hypothesis put forward by the accused, however, far-fetched and fanciful it might be. Nor does it mean that prosecution evidence must be rejected on the slightest doubt because the law permits rejection if the doubt is reasonable and not otherwise.

The other aspect of the issue is that the evidence on record, ascribed to be circumstantial, ought to justify the inferences of the guilt from the incriminating facts and circumstances which are incompatible with the innocence of the accused or guilt of any other person. The observations of this Court in the case of *Balwinder Singh v State of Punjab*, AIR 1987 SC 350 : 1987 Cr LJ 330 : (1987) 1 SCC 1 lends concurrence to the above.

In a more recent decision of this Court in *Sudama Pandey v State of Bihar*, (2002) 1 SCC 679, the law as noticed above and to the same effect stands very felicitously expressed.

15. *Pawan Kumar v State of Haryana,* AIR 2001 SC 1324 : AIR 2001 SCW 1111 : (2001) 3 SCC 628.

There is no doubt that conviction can be based solely on circumstantial evidence but it should be tested by the touch-stone of law relating to circumstantial evidence laid down by this Court as far back as in 1952.

In *Hanumant Govind Nargundkar v State of Madhya Pradesh*, AIR 1952 SC 343 : 1952 SCJ 509 : 1952 SCR 1091, it was observed thus:

It is well to remember that in cases where the evidence is of a circumstantial nature, the circumstances from which the conclusion of guilt is to be drawn should in the first instance be fully established and all the facts so established should be consistent only with the hypothesis of the guilt of the accused. Again, the circumstances should be of a conclusive nature and tendency and they should be such as to exclude every hypothesis but the one proposed to be proved. In other words, there must be a chain of evidence so far complete as not to leave any reasonable ground for a conclusion consistent with the innocence of the accused and it must be such as to show that within all human probability the act must have been done by the accused.

A reference may be made to a later decision in *Sharad Birdhichand Sarda v State of Maharashtra*, AIR 1984 SC 1622 : (1984) 4 SCC 116 : 1984 Cr LJ 1738. Therein, while dealing with circumstantial evidence, it has been held that onus was on the prosecution to prove that the chain is complete and the infirmity of lacuna in prosecution cannot be cured by false defence or plea.

The conditions precedent in the words of this Court, before conviction could be based on circumstantial evidence, must be fully established. They are:

(1) the circumstances from which the conclusion of guilt is to be drawn should be fully established. The circumstances concerned 'must' or 'should' and not 'may be' established;

(2) the facts so established should be consistent only with the hypothesis of the guilt of the accused, that is to say, they should not be explainable on any other hypothesis except that the accused is guilty;

(3) the circumstances should be of a conclusive nature and tendency;

(4) they should exclude every possible hypothesis except the one to be proved; and

(5) there must be a chain of evidence so complete as not to leave any reasonable ground for the conclusion consistent with the innocence of the accused and must show that in all human probability the act must have been done by the accused.

These aspects were recently highlighted in *State of Rajasthan v Rajaram*, AIR 2003 SC 3601 : 2003 AIR SCW 4097 : 2003 Cr LJ 3901.

There is no doubt that conviction can be based solely on circumstantial evidence but it should be tested by the touchstone of law relating to circumstantial evidence laid down by this Court as far back as in 1952.

2.5.3 Dereliction in Investigation[16]

Author's Summary

It is a case of murder. Three persons attacked and killed their neighbour with *lathis*. The police and the medico-legal expert did not do the investigation properly. The court passed strictures against them and asked the government to take action against them. The ire of the court is indicated in italics (by the author) of the relevant text.

Highlights italicised

16. *Dayal Singh v State of Uttaranchal,* AIR 2012 SC 3046 : (2012) 8 SCC 263 : 2012 Cr LJ 4323. [DOJ 3 August 2012].

2.5.4 Relevant Extract (Verbatim)

The facts giving rise to the questions in the present appeal are that the fields of Gurumukh Singh and Dayal Singh were adjoining in the village Salwati within the limits of Police Station Sittarganj, district Udham Singh Nagar. These fields were separated by a mend (boundary mound). On 8 December 1985 Gurumukh Singh, the complainant, who was examined as PW-2, along with his father Pyara Singh, had gone to their fields. At about 12 noon, Smt. Balwant Kaur, PW-4, wife of Pyara Singh came to the fields to give meals to Pyara Singh and their son Gurumukh Singh. At about 12.45 p.m, the accused persons, namely, Dayal Singh, Budh Singh & Resham Singh (both sons of Dayal Singh) and Pahalwan Singh came to the fields wielding lathis and started hurling abuses. They asked Pyara Singh and Gurumukh Singh as to why they were placing earth on their mend, upon which they answered that mend was a joint property belonging to both the parties. Without any provocation, all the accused persons started attacking Pyara Singh with lathis. Gurumukh Singh, PW-2, at that time, was at a little distance from his father and Smt. Balwant Kaur, PW-4, was nearby. On seeing the occurrence, they raised an alarm and went to rescue Pyara Singh. The accused, however, inflicted lathi injuries on both PW-2 and PW-4. In the meanwhile, Satnam Singh, who was ploughing his fields, which were quite close to the fields of the parties and Uttam Singh (PW-5) who was coming to his village from another village, saw the occurrence. These two persons even challenged the accused persons upon which the accused persons ran away from the place of occurrence. Pyara Singh, who had been attacked by all the accused persons with lathis fell down and succumbed to his injuries on the spot. Few villagers also came to the spot.

According to the prosecution, pagri (Ex. 1) of one of the accused, Budh Singh, had fallen on the spot which was subsequently taken into custody by the Police. Gurumukh Singh, PW-2, left the dead body of his deceased father in the custody of the villagers and went to the police station where he got the report, Exhibit Ka-3, scribed by Kashmir Singh in relation to the occurrence. The report was lodged at about 2.15 p.m. on 8 December 1985 by PW-2 in presence of SI Kartar Singh, PW-6. FIR (Exhibit Ka-4A) was registered and the investigating machinery was put into motion. The two injured witnesses, namely, PW-2 and PW-4 were examined by Dr. P.C. Pande, PW 1, the medical officer at the Public Health Centre, Sittarganj on the date of occurrence.

At 4.00 p.m., the doctor examined PW-2 and noticed the following injuries on the person of the injured witness *vide* Injury Report, Ex. Ka-1.

1. Lacerated wound of 5 cm X 1 cm and 1 cm in depth. Margins were lacerated. Red fresh blood was present over wound. Wound was caused by hard and blunt object. Wound was at the junction of left parietal and occipital bone 7 cm from upper part of left ear caused by blunt object. Advised X-ray. Skull A.P. and lateral and the injury was kept under observation.
2. Contusion of 6 cm X 2.5 cm on left side of body 3 cm above the left iliac crest. Simple in nature caused by hard and blunt object.

According to the doctor, the injuries were caused by hard and blunt object and they were fresh in duration.

On 8 December 1985 at 7.30 p.m. Dr. P.C. Pande (PW-1) examined the injuries of Smt. Balwant Kaur PW-4 and found the following injuries on her person *vide* injury report Ex. Ka. 2:

1. Contusion 6 cm X 3 cm on left shoulder caused by hard and blunt object.
2. Contusion of 5 cm X 2 cm on lateral side of middle of left upper arm. Bluish red in colour caused by hard and blunt object.

3. Contusion of 4 cm X 2 cm on left parietal bone 6 cm from left ear caused by hard and blunt object.

According to Dr. Pande, these injuries were caused by hard and blunt object and the duration was within 12 hours and the nature of the injuries was simple. According to Dr. Pande the injuries of both these injured persons could have been received on 8 December 1985 at 12.45 p.m. by lathi."

As noted above, according to Dr. Pande, the injuries were caused by a hard and blunt object and duration was within 12 hours. Thereafter, SI Kartar Singh, PW-6, proceeded to the place of occurrence in village Salwati. He found the dead body of Pyara Singh lying in the fields. In the presence of panchas, including Balwant Singh, PW-8, he noticed that there were three injuries on the person of the deceased, Pyara Singh and prepared Inquest Report *vide* Ex. Ka-6 recording his opinion that the deceased died on account of the injuries found on his body. After preparing the site plan, Ext. Ka-10, he also wrote a letter to the superintendent, Civil Hospital, Haldwani for post-mortem, being Exhibit Ka-9. The dead body was taken to the said hospital by Constable Chandrapal Singh, PW-7. Dr. C.N. Tewari, PW-3, medical officer in the Civil Hospital, Haldwani, performed the post-mortem upon the body of the deceased and did not find any ante-mortem or post-mortem injuries on the dead body. On internal examination, he did not find any injuries and could not ascertain the cause of death. Further, he preserved the viscera and gave the post-mortem report, Exhibit Ka-4. After noticing that there was no injury or abnormality found upon external and internal examination of the dead body, the doctor in his report recorded as under:

> Viscera in sealed jars handed over to the accompanying constables.
>
> Jar No. 1 sample preservative saline water.
>
> Jar No. 2 Pieces of stomach
>
> Jar No. 3 Pieces of liver, spleen and kidney.
>
> Death occurred about one day back. Cause of death could not be ascertained. Hence, viscera preserved.

It appears from the record that the deceased's viscera, which allegedly was handed over by doctor to the police, was either never sent to the Forensic Science Laboratory (for short, the 'FSL') for chemical examination, or if sent, the report thereof was neither called for nor proved before the Court. In fact, this has been left to the imagination of the Court. Considering the ocular and other evidence produced by the prosecution, the learned trial court *vide* its judgment of conviction and order of sentence, both dated 29th June, 1990, found the accused persons guilty of offences under section 302 read with section 34 IPC as well as under section 323 read with section 34 IPC. The trial court, while dealing with the arguments of the accused for application of section 34, as well as the submission that the witnesses had not attributed specific role to the respective accused persons, held as under:

"The attack was premeditated and the accused had come fully prepared to do the overt act. The injury was caused on the head of the deceased which is a vital part of the body at which it was aimed by employing lathi, it was clear that the accused persons had intended to cause death by giving blow on vital part of the body of the deceased. After receiving the injuries, the deceased fell down and even thereafter he was attacked by the accused persons and he died on the spot immediately.

Now, we will deal with the question of defective or improper investigation resulting from the acts of omission and/or commission, deliberate or otherwise, of the Investigating Officer or other material Witnesses, who are obliged to perform certain duties in discharge of their functions and then to examine its effects. In order to examine this aspect in conformity with the rule of law and keeping in mind the basic principles of criminal jurisprudence, and the questions framed by us at the very outset of this judgment, the following points need consideration:

(i) Whether there have been acts of omission and commission which have resulted in improper or defective investigation.

(ii) Whether such default and/or acts of omission and commission have adversely affected the case of the prosecution.

(iii) Whether such default and acts were deliberate, unintentional or resulted from unavoidable circumstances of a given case.

(iv) If the dereliction of duty and omission to perform was deliberate, then is it obligatory upon the court to pass appropriate directions including directions in regard to taking of penal or other civil action against such officer/witness.

In order to answer these determinative parameters, the Courts would have to examine the prosecution evidence in its entirety, especially when a specific reference to the effective or irresponsible investigation is noticed in light of the facts and circumstances of a given case.

The Investigating Officer, as well as the doctor who are dealing with the investigation of a criminal case, are obliged to act in accordance with the police manual and the known canons of medical practice, respectively. They are both obliged to be diligent, truthful and fair in their approach and investigation. A default or breach of duty, intentionally or otherwise, can sometimes prove fatal to the case of the prosecution. An Investigating Officer is completely responsible and answerable for the manner and methodology adopted in completing his investigation. Where the default and omission is so flagrant that it speaks volumes of a deliberate act or such irresponsible attitude of investigation, no court can afford to overlook it, whether it did or did not cause prejudice to the case of the prosecution. It is possible that despite such default/omission, the prosecution may still prove its case beyond reasonable doubt and the court can so return its finding. But, at the same time, the default and omission would have a reasonable chance of defeating the case of the prosecution in some events and the guilty could go scot-free. We may illustrate such kind of investigation with an example where a huge recovery of opium or poppy husk is made from a vehicle and the Investigating Officer does not even investigate or make an attempt to find out as to who is the registered owner of the vehicle and whether such owner was involved in the commission of the crime or not. Instead, he merely apprehends a cleaner and projects him as the principal offender without even reference to the registered owner. Apparently, it would *prima facie* be difficult to believe that a cleaner of a truck would have the capacity to buy and be the owner, in possession of such a huge quantity, *i.e.,* hundreds of bags, of poppy husk. The investigation projects the poor cleaner as the principal offender in the case without even reference to the registered owner.

Even the present case is a glaring example of irresponsible investigation. It, in fact, smacks of intentional mischief to misdirect the investigation as well as to withhold material evidence from the Court. It cannot be considered a case of *bona fide* or unintentional omission or commission. It is not a case of faulty investigation simpliciter but is an investigation coloured with motivation or an attempt to ensure that the suspect can go scot-free. This can safely be gathered from the following:

(a) The entire investigation, including the statement of the investigating officer, does not show as to what happened to the viscera which was, as per the statement of PW 3, handed over to the Constable, PW-7, who, in turn, stated that the viscera had been deposited in the Police Station Malkhana. In the entire statement of the Investigating Officer, there is no reference to viscera, its collection from the hospital, its deposit in the Malkhana and whether it was sent to the FSL at all or not. If sent, what was the result and, if not, why?

(b) Conduct of the Investigating Officer is more than doubtful in the present case. In his statement, he had stated that he noticed three injuries on the body of the deceased. He also admitted that in the post-mortem report, no internal or external injuries were shown on the body of the deceased. According to him, he had asked PW-3 in that regard but the reply of the doctor was received late and the explanation rendered was satisfactory. Firstly, this reply or explanation does not find place on record. There is no document to that effect and secondly, even in his oral evidence, he does not say as to what the explanation was.

(c) In his statement, PW-3, Dr. C.N. Tewari, stated that he did not find any external or internal injuries even after performing the post-mortem on the body of the deceased. This remark on the post-mortem report apparently is falsified both by the eyewitnesses as well as the Investigating Officer. It will be beyond apprehension as to how a healthy person could die, if there were no injuries on his body and when, admittedly, it was not a case of cardiac arrest or death by poison etc., more so, when he was alleged to have been assaulted with dandas (lathi) by four persons simultaneously. In any case, the doctor gave no cause for death of the deceased and prepared a post-mortem repor, which ex facie was incorrect and tantamount to abrogation of duty. The trial court while giving the judgment of conviction, noticed that medico-legal post-mortem examination is a very important part of the prosecution evidence and, therefore, it is necessary that it be conducted by a doctor fully competent and experienced. The Court also commented adversely upon the professional capabilities and/or misconduct of Dr. C.N. Tewari, as follows:

> ***"Whatever may have been the reasons but it is quite evident that Dr. C.N. Tewari failed in his professional duty and he did not perform post-mortem examination properly after considering the inquest report and the police papers sent to him. If his finding differed from the finding of the Panchas he should have informed his superior officers in that regard so that another opinion could have been obtained before the disposal of the dead body. The evidence leaves no room for doubt that Sri Pyara Singh was attacked with lathis as alleged by the prosecution and he received three injuries already referred to above which were mentioned in the inquest report (Ex. Ka-6)...***
>
> ***The case of the prosecution cannot be thrown on account of the gross negligence and apathy of the Medical Officer Dr. C.N. Tewari who had performed autopsy on the dead body of Sri Pyara Singh. Since the Medical Officer Dr. C.N. Tewari had conducted in a manner not befitting the medical profession and prepared post-mortem report against facts for reasons best known to him and was negligent in his duty in ascertaining the injuries on the body of the deceased, hence it is just and proper that the Director-General, Medical Health U.P. be informed in this regard for taking necessary action and for eradicating such practices in future."***

2.5.5 Duties of the Court

Now, we may advert to the duty of the Court in such cases. In the case of *Sathi Prasad v State of Uttar Pradesh*, (1972) 3 SCC 613 : AIR 1973 SC 448 : 1973 Cr LJ 344

> *This Court stated that it is well-settled that if the police records become suspect and investigation perfunctory, it becomes the duty of the Court to see if the evidence given in Court should be relied upon and such lapses ignored. Noticing the possibility of investigation being designedly defective, this Court in the case of Dhanaj Singh @ Shera v State of Punjab, (2004) 3 SCC 654 : AIR 2004 SC 1920 : 2004 AIR SCW 1609, held, "in the case of a defective investigation the Court has to be circumspect in evaluating the evidence. But it would not be right in acquitting an accused person solely on account of the defect; to do so would tantamount to playing into the hands of the investigating officer if the investigation is designedly defective."*

23. Dealing with the cases of omission and commission, the Court in the case of *Paras Yadav v State of Bihar*, AIR 1999 SC 644 : 1999 AIR SCW 296 : 1999 Cr LJ 1122, enunciated the principle, in conformity with the previous judgments, that

> *If the lapse or omission is committed by the investigating agency, negligently or otherwise, the prosecution evidence is required to be examined de hors such omissions to find out whether the said evidence is reliable or not. The contaminated conduct of officials should not stand in the way of evaluating the evidence by the courts, otherwise the designed mischief would be perpetuated and justice would be denied to the complainant party.*

In the case of *Zahira Habibullah Sheikh v State of Gujarat*, (2006) 3 SCC 374 : AIR 2006 SC 1367 : 2006 AIR SCW 1340, the Court noticed the importance of the role of witnesses in a criminal trial. The importance and primacy of the quality of trial process can be observed from the words of Bentham, who states that witnesses are the eyes and ears of justice. The Court issued a caution that in such situations, there is a greater responsibility of the court on the one hand and on the other the courts must seriously deal with persons who are involved in creating designed investigation. The Court held that legislative measures to emphasize prohibition against tampering with witness, victim or informant have become the imminent and inevitable need of the day.

Conducts which illegitimately affect the presentation of evidence in proceedings before the Courts have to be seriously and sternly dealt with. There should not be any undue anxiety to only protect the interest of the accused. That would be unfair, as noted above, to the needs of the society. On the contrary, efforts should be to ensure fair trial where the accused and the prosecution both get a fair deal. Public interest in proper administration of justice must be given as much importance if not more, as the interest of the individual accused. The courts have a vital role to play. Having analyzed and discussed in some elaboration various aspects of this case, we pass the following orders:

> ***(A) The appeal is dismissed both on merits and on quantum of sentence.***
>
> ***(B) The Director-Generals, Health Services of UP/Uttarakhand are hereby issued notice under the provisions of the Contempt of Courts Act, 1971 as to why appropriate action be not initiated against them for not complying with the directions contained in the judgment of the trial court dated 29th June, 1990.***
>
> ***(C) The above said officials are hereby directed to take disciplinary action against Dr. C.N. Tewari, PW-3, whether he is in service or has since retired, for deliberate dereliction of duty, preparing a report which ex facie was incorrect and was in conflict with the inquest report (Exhibits Ka-6 and Ka-7) and statement of PW-6. The bar on limitation, if any, under the Rules will not come into play because they were directed by the Order dated 29th June, 1990 of the Court to do so. The action even for stoppage/reduction in pension can appropriately be taken by the said authorities against Dr. C.N. Tewari.***
>
> ***(D) Director-Generals of Police UP/Uttarakhand are hereby directed to initiate, and expeditiously complete, disciplinary proceedings against PW-6, SI Kartar Singh, whether he is in service or has since retired, for***

the acts of omission and commission, deliberate dereliction of duty in not mentioning reasons for non-disclosure of cause of death as explained by the doctor, not sending the viscera to the FSL and for conducting the investigation of this case in a most callous and irresponsible manner. The question of limitation, if any, under the rules, would not apply as it is by direction of the Court that such enquiry shall be conducted.

(E) We hold, declare and direct that it shall be appropriate exercise of jurisdiction as well as ensuring just and fair investigation and trial that courts return a specific finding in such cases, upon recording of reasons as to deliberate dereliction of duty, designedly defective investigation, intentional acts of omission and commission prejudicial to the case of the prosecution, in breach of professional standards and investigative requirements of law, during the course of the investigation by the investigating agency, expert witnesses and even the witnesses cited by the prosecution. Further, the Courts would be fully justified in directing the disciplinary authorities to take appropriate disciplinary or other action in accordance with law, whether such officer, expert or employee witness, is in service or has since retired.

40. The appeal is accordingly dismissed.

2.6 ADDITIONAL CASE LAW

2.6.1 Judicial Misuse of "beyond reasonable doubt"[17]

Author's Note

This is a landmark judgment of SC on frequent acquittals. In more than 90% of the heinous crimes, the criminals are acquitted on a single plea: not proved "*beyond reasonable doubt*", by doubting Thomas's, mostly on unsound grounds; making mockery of CJS, and promoting lawlessness in the country.

The Apex Court has condemned misuse of the phrase "***not proved beyond reasonable doubt***".

Highlights italicised

2.6.2 Relevant Extracts (Verbatim)

Even at this stage we may remind ourselves of a necessary social perspective in criminal cases which suffers from sufficient forensic appreciation.

The dangers of exaggerated devotion to the rule of benefit of doubt at the expense of social defence and to the soothing sentiment that all acquittals are always good regardless of justice to the victim and the community, demand especial emphasis in the contemporary context of escalating crime and escape. The judicial instrument has a public accountability. The cherished principles or golden thread of proof beyond reasonable doubt which runs through the web of our law should not be stretched morbidly to embrace every punch, hesitancy and degree of doubt. The excessive solicitude reflected in the attitude that a thousand guilty men may go but one innocent martyr shall not suffer is a false dilemma.

Only reasonable doubts belong to the accused. Otherwise any practical system of justice will then break down and lose credibility with the community. The evil of acquitting a guilty person

17. *Shivaji Sahebrao Bobade v State of Maharashtra,* AIR 1973 SC 2622 : (1973) 2 SCC 793 : 1973 Cr LJ 1783.

light-heartedly as a learned author has sapiently observed, goes much beyond the simple fact that just one guilty person has gone unpunished. If unmerited acquittal become general, they tend to lead to a cynical disregard of the law, and this in turn leads to a public demand for harsher legal presumptions against indicted 'persons' and more severe punishment of those who are found guilty. Thus, too frequent acquittals of the guilty may lead to a ferocious penal law, eventually eroding the judicial protection of the guiltless. For all these reasons it is true to say, with Viscount Simon, that:

a miscarriage of justice may arise from acquittal of the guilty no less than from the conviction of the innocent…

2.6.3 Scientific Criminal Investigation[18]

Author's Summary

The culprit in this case, misappropriated a huge sum of Rs 594.88 crores. The police arrested and tried to interrogate him. However, he did not cooperate. The police, therefore, wanted to use Polygraph, Narco Analysis, and Brain Mapping tests. Defence alleged it is indirect physical torture and it is against Article 20(3) of the Constitution. However, the court allowed the tests, because they thought these scientific methods are substitutes for III-degree methods.

2.6.4 Relevant Extracts (Verbatim)

1. The petition is filed challenging the order passed by the learned Additional Chief Metropolitan Magistgrate, Egmore, Chennai in Crl. M.P. No. 389 of 2006 in RC 4(E)/2006-BS&FC, CBI, New Delhi in C.C. No. 19189 of 2007.

2. The petitioner has been accused of misappropriation of a sum of Rs. 594.88 crores by selling 1,30,00,000 unallotted unlisted shares of DSQ Software Limited.

3. The petitioner was arrested and produced before the learned Additional Chief Metropolitan Magistrate, Egmore, Chennai, on 14-2-2006. The learned Additional Chief Metropolitan Magistrate, Egmore, Chennai, was pleased to grant police custody from 14-2-2006 to 24-2-2006. The said police custody was extended till 27-2-2006 on the basis of the affidavit filed by the Investigating Officer. The accused was thereafter surrendered to judicial custody on 27-2-2006.

4. The respondent-police filed a petition seeking permission to conduct the Polygraph, Narco analysis and Brain Mapping test on the accused and to direct the Superintendent of Prisons, Central Jail, Chennai, to produce the accused before the FSL Bangalore on 7th and 8th March, 2006, to undergo the aforesaid tests.

5. The reason assigned in the petition seeking such a relief by the respondent herein is that the accused failed to co-operate with the investigation process undertaken during custodial interrogation. To unravel the end use of huge defrauded amount, scientific investigation will have to be carried out, it has been alleged.

6. The learned Additional Chief Metropolitan Magistrate, Egmore, Chennai, having considered the gravity of the offence alleged against the petitioner and his non-cooperation during the course of investigation under police custody, was pleased to allow the petition filed by the respondent herein.

18. *Dinesh Dalmia v State of Tamil Nadu,* 2006 Cr LJ 2401 : 2006 (4) Crimes 351 : 2006 (4) Rec Cri R 361.

7. In the criminal revision, it is contended that the accused cannot be compelled to give evidence as against him. The grant of police custody beyond 15 days, is out of the purview of section 167 of the Code of Criminal Procedure. There is an intrusion in the constitutional right of the accused to be silent under article 20(3) of the Constitution of India.

8. Learned senior counsel appearing for the petitioner-accused would submit that there is health hazard in Polygraph, Narco Analysis and Brain Mapping tests. It is an indirect physical torture launched against the accused, it is submitted. Learned senior counsel would further argue that when the accused had not given any consent to subject himself to the aforesaid scientific tests, a false statement has been given in the petition by the Investigating Officer as though the accused volunteered to face such tests. It is his further submission that the learned Additional Chief Metropolitan Magistrate, Egmore, Chennai has thrown to wind the mandatory provision as contemplated under section 167 of the Code of Criminal Procedure that the police custody shall not be permitted beyond 15 days.

9. Learned counsel for the respondent on being served with the notice, appeared and submitted that the accused has volunteered to undergo the tests. It is his submission that the question of taking the accused to police custody beyond the period of 15 days does not arise in this matter as the accused had been directed only to appear for the tests. He would further argue that the aforesaid scientific tests will have to be conducted to unravel the mystery. It is his last submission that the criminal revision case laid by the petitioner accused under section 397 of the Code of Criminal Procedure is not maintainable.

12. In this matter, the right to direct the accused to undergo scientific tests has been finally determined by the Court below and thereby the criminal proceedings taken to demystify the grey area of investigation has culminated. Therefore, the Court finds that the present order impugned which substantially determines the rights of the parties is a final order challengeable under section 397 of the Code of Criminal Procedure by way of revision.

13. Of course, Article 20(3) of the Constitution of India, recognizes the right of the accused to be silent. The Investigating Officer has come out with a version that the accused has volunteered to undergo such a test. Of course, such a contention of the Investigating Officer is disputed by the accused now.

14. Huge amount has allegedly been misappropriated by the accused and the investigating agency is completely in the dark as to the end use of such a huge amount siphoned off by the accused. The Investigating Officer did not use third decree methods to extract incriminating materials through the mouth of the accused. Only a scientific test on the accused is prayed for by the respondent-complainant. That the accused will face health hazard and his physical frame will be endangered if he undergoes such scientific tests are totally without any scientific basis. As rightly pointed out by the learned counsel for the respondent, the scientific tests are like taking MRI or CT Scan. The scientific value of such tests and the credibility thereof will have to be evaluated only during the course of trial. Unless such tests are conducted, the investigating agency may not be in a position to come out with clinching testimony as against the petitioner. Subjecting an accused to undergo such scientific tests will not amount to breaking his silence by force. He may be taken to the laboratory for such tests against his Will, but the revelation during such tests is quite voluntary. Therefore, such process does not amount to compelling a witness to give evidence as against him.

15. It has been held in the authority in *Nandini Satpathy v P.L. Dani*, AIR 1978 SC 1025 : 1978 Cr LJ 968 : (1978) 2 SCC 424 as follows (Para 53)—

> The phrase 'compelled testimony' must be read as evidence procured not merely by physical threats or violence but by psychic torture, atmospheric pressure, environmental coercion, tiring interrogative prolixity, overbearing and intimidatory methods and the like — not legal penalty for violation. So, the legal perils following upon refusal to answer, or answer truthfully, cannot be regarded as compulsion within the meaning of article 20(3).

The aforesaid authority deals with application of third decree methods to compel an accused to come out with revelation. The above authority will have no application to scientific tests which helps the Investigating Officer to unravel the mystery.

16. Under section 167 of the Code of Criminal Procedure, the learned Additional Chief Metropolitan Magistrate, Egmore, Chennai has power only to remand the accused under police custody for a total period of 15 days. Here in this case, the police custody was already granted for 14 long days. Now the respondent has not sought before the learned Additional Chief Metropolitan Magistrate, Egmore, Chennai, to give the accused to police custody for further interrogation. The respondent has only sought a permission to conduct three types of scientific tests and also a direction to the Superintendent of Central Prisons, to produce the accused to undergo such tests. Such a prayer will not amount to seeking for police custody of an accused for further interrogation. Therefore, the legal submission made by the learned senior counsel for the petitioner with regard thereto stands rejected.

17. As the accused had not allegedly come forward with the truth, the scientific tests are resorted to by the investigating agency. Such a course does not amounts to testimonial compulsion. When there is a hue and cry from the public and the human rights activists that the investigating sleuths adopt third degree methods to extract information from the accused, it is high time the investigating agency took recourse to scientific methods of investigation. The learned Additional Chief Metropolitan Magistrate, Egmore, Chennai, has granted the relief as prayed for by the respondent herein to secure the ends of justice. Therefore, there is no warrant for up-setting the order passed by the Court below.

2.6.5 Broken Custody Chain; Recovery Doubtful[19]

Mr. Singh had sent the plain and blood stained earth, one *Paijama*, one *Kurta*, one *Baniyan*, one underwear and one bullet which was recovered from the dead-body at the time of post-mortem for chemical examination. He had also sent the 'katta' which was recovered at the instance of accused Imamuddin for examination by ballistic expert.

Before proceeding further it is proper to mention the ante-mortem injuries found on the dead body of Nabi Sarvar.

1. "Firearm wound of entry 4.00 cm x 1.00 cm x cranial cavity deep on right side frontal temporal region elliptical in shape, inverted margin, edges-blackened.
2. Firearm wound of exit 2.00 cm x 1.5 cm x cranial cavity deep through and through on left side skull, 7 cm, above and lateral to left ear. Margin-everted, communicating to injury No. 1.

19. *Imamuddin v State of Uttar Pradesh,* 2009 Cr LJ 4477 : 2009 (5) All LJ 366 : 2009 (66) All Cri C 259.

3. Fire arm wound of entry 1.00 cm x 1.00 cm x chest cavity deep on left side upper part of chest 7.00 cm, above left nipple at 2 o'clock position. Margin-inverted edge-blackened. Direction downward laterally. On internal examination:

   Right frontal and temporal bones were found fractured, left parietal bone was also fractured, left and right lungs were punctured, one metallic bullet was found in the thoracic cavity.

   In the opinion of the doctor, death was caused due to shock and haemorrhage as a result of ante-mortem injuries. Death had taken place within one day.

   The learned counsel for the appellant argued that the trial court has committed illegality in finding the appellant guilty for the murder of Nabi Sarvar. When the evidence of PW-1 Zahir Ahmad and PW-2 Rais was disbelieved in respect of accused Nasruddin, it ought not to have been accepted in respect of Imamuddin. He further argued that the learned trial court has laid emphasis upon the fact that a country made pistol was recovered at the instance of Imamuddin and as per the ballistic expert report, the same was found to have been used in the commission of the crime. He argued that the prosecution has failed to prove that the alleged recovery of fire arm was pursuant to any disclosure statement of Imamuddin and that the recovery itself was doubtful as the independent witnesses of recovery namely, Mushtak Ahmad and Akik Ahmad, were not examined in the court. Moreover, the alleged recovery was made from an open place which was accessible to each and everyone. He further argued that the bullet, which was recovered from the dead body at the time of post-mortem, was sent to the Superintendent of Police, Azamgarh in a sealed cover and the prosecution has failed to lead any link evidence that it was the same bullet which was sent for examination by ballistic expert.

   Moreover, this fact can also not be left off the sight that the alleged recovery of the pistol was made on 5-6-1998 whereas the incident had taken place on 13-11-1997. Thus the recovery of the pistol has been made say about six months after the occurrence. In this connection a judgment of Hon'ble the Supreme Court in *Gopal Sah v State of Bihar,* 2009 (64) ACC 997 may be referred. In that case the accused were arrested and on their disclosure statements, blood stained axe and a sickle allegedly used in the murder.

   As the recovery of the pistol is highly suspicious and cannot be placed reliance the knowledge of the accused Imamuddin as to its concealment beneath the earth also cannot be believed.

   Learned counsel for the appellant argued that no reliance can be placed upon the report of ballistic expert (Ext Ka-6) to the effect that the bullet (recovered from the dead body of Nabi Sarvar) was fired from the pistol allegedly recovered at the instance of appellant as it is highly doubtful that the bullet remained intact and was not tampered with till its examination by ballistic expert. It is to be noted that as per the post-mortem report Ext Ka-2, the metallic bullet found in the dead body of Nabi Sarvar was kept in sealed envelope and was given to the constable who had accompanied the dead body. The prosecution has not led any evidence that after the bullet was received from the doctor where it was kept. If it was kept at the Malkhana of the police station concerned, then no police official of the Malkhana has been examined to prove that nobody was allowed to tamper with the bullet and it remained in the sealed cover till the same was sent to the scientific laboratory for examination. If the bullet was sent from the Malkhana of the Police Station to the Sadar Malkhana then no one from the Sadar Malkhana has been examined to depose

as above. However, from the report of the scientific laboratory (Ext. Ka-4) it appears that the bullet alongwith other materials (such as plain and blood stained earth and the clothes of the deceased) was received in the scientific laboratory on 20-8-1998 through special messenger. The post-mortem was done on 14-11-1997. It is thus clear that the bullet remained at the police station for about nine months and there is no reason as to why the bullet was not sent to the laboratory at an early date.

The pistol was allegedly recovered at the instance of the accused on 5-6-1998. There is no evidence on record to show as to where the pistol was kept after its recovery *i.e.,* either at the police station Malkhana or in the Sadar Malkhana. Again no link evidence has been produced to prove as to when this pistol was sent for ballistic expert examination. The ballistic expert report is (Ext. Ka-6) on the record which shows (that the pistol was received for ballistic expert examination on 24-12-1998 from the sero-section of the scientific laboratory Lucknow. However, there is no evidence as to when the pistol was sent from the police station or the Sadar Malkhana to the scientific laboratory. In any case the pistol after its alleged recovery on 5-6-1998 reached the ballistic expert only on 24-12-1998 and no reason for this delay has been given. It is therefore, apparent that the police had in its possession not only the bullet recovered from the dead body but also the pistol which was allegedly recovered at the instance of accused Imamuddin and there was ample opportunity with the Investigating Officer to tamper with the bullet during this period. The inordinate delay in sending the bullet and pistol for scientific and ballistic expert elimination creates strong suspicion whether the alleged recovered bullet was sent to the ballistic expert or in its place another bullet fired from the recovered pistol was sent to the ballistic expert for comparison as there was ample opportunity for the police to have done so. In these circumstances the report of the ballistic expert also loses its importance.

2.6.6 Good Evidence[20]: [The Acid Test for truthful evidence: Cross-examination]

Now it is true that it is an elementary principle of law that evidence, which cannot be tested must be rejected. There are two methods of testing evidence and ensuring that truth comes out in evidence. The first is by administration of oath and the other is by cross-examination. The administration of oath is designed to secure truthfulness in evidence by providing not only moral sanction but also sanction of perjury. Cross-examination, on the other hand, extracts truth and exposes falsehood much against the will of the person examined. The exercise of the right of cross-examination has always been regarded as one of the most efficacious tests which the law has devised for discovery of truth. So important is the right that the law declares that no evidence affecting a party is admissible against that party unless the latter has had an opportunity of testing its truthfulness by cross-examination.

The opinion of the chemical examiner stands on the same footing as any other piece of evidence, and it is difficult to see how any reliance can be placed on the opinion unless it is supported by good reasons founded on facts, which warrant the opinion. If the reasons are good and convincing and the factual data, on the basis of which the opinion is formed, warrant the opinion, the court will rely on the opinion and hold on the basis of the opinion that the concentration of alcohol in the blood of the accused was as opined by the chemical examiner. If, however, the factual data is not clear or adequate or the reasons are frivolous or inconclusive, the opinion will have no probative value. That is the reason why section 51 of the Indian Evidence Act provides that whenever the opinion of any living person is relevant the grounds

20. *Suleman Usman Memon v State of Gujarat*, AIR 1961 Guj 120 : (1961) 2 Cr LJ 78 (Guj). Also see *Emperor v Behram Irani*, AIR 1944 Bom 321 : 46 Bom LR 481 : 46 Cr LJ 162.

on which such opinion is based are also relevant. It would be most unsafe to convict the accused on the basis of a report which contains merely the *ipse dixit* of the chemical examiner and which does not contain any factual data or any grounds or reasons which the court can examine for the purpose of deciding whether the opinion contained in the report is correct or not. To convict the accused on the basis of such a report would be to leave the decision of the case in the hands of the chemical examiner, which certainly the court cannot do.

2.6.7 Eyewitness Accounts v Medico-Legal Expert Evidence[21]

The contention on which considerable emphasis has been laid by the learned counsel for not believing the eyewitnesses is that their evidence is in conflict with the medical evidence.

There is a three-pronged attack of the learned counsel. His contention is that according to the direct evidence there were two fires which hit the deceased whereas according to the medical evidence there was only one entry wound and two exits. Therefore, the direct evidence is belied. Another branch of his argument in this connection is that the gunshot wound in the chest of the deceased caused a big hole which must have resulted in profuse bleeding, but no blood was found from the hut in which the first shot is said to have been fired up to the place where the deceased fell dead on account of the second gunshot in the back. The third branch of his argument is that no wads and pellets were found inside the hut.

The evidence of the doctor, in our opinion, does not exclude the possibility of there being two gunshots which may have struck the deceased. May be, that the second gunshot alleged to have been fired from behind by the assailant while the deceased was running, was not effective. On the basis of indefinite opinion of the medical expert as in the present case, we are not prepared to reject the direct evidence.

Learned public prosecutor has also urged that most of the pellets of the second gun-fire may not have hit the victim on account of wide dispersion and the eye witnesses may have thought that the second gun-shot hit the back of the deceased. The explanation furnished by the learned public prosecutor cannot be said to be altogether devoid of force. In *Mohanlal v State of Rajasthan,*[22] it was observed that:

> *There is always a tendency to over-emphasise discrepancies between the evidence of eyewitnesses and medical testimony. These discrepancies should be treated and appraised just like other discrepancies in the statements of the witnesses. It cannot be forgotten that the eyewitnesses may not give a very correct and accurate account of the version and may at places make exaggerations or may fail to give correct facts either on account of lapse of memory or on account of inability to observe minutely or to recite correctly. It should also be borne in mind that sometimes, the medical officers also do not bestow sufficient care while performing examinations and their opinions may not be properly formed on account of inadequate or defective examinations or lack of complete knowledge. It is, therefore, hardly fair to expect a complete and perfect correspondence between the medical evidence and the eye-testimony. Naturally, therefore, the court may carefully examine the discrepancies and if it is reasonably open to arrive at a substantial and true version of the prosecution case, the courts should not adopt the easy course of throwing away the prosecution case on the alleged discrepancies between the medical evidence and the eye-testimony.*

In *Nanhku Singh v State of Bihar,*[23] their Lordships of the Supreme Court observed as follows:—

> *When a person fires at a place where, as here, there are two persons one witness may think that it is fired at one person and the other may think that it was fired at the other. Merely because the inference drawn by one witness which may not fit in with the inference drawn by the other*

21. *Ram Narain v State of Punjab,* AIR 1975 SC 1727 : 1976 SCR (1) 27.
22. *Mohanlal v State of Rajasthan,* AIR 1961 Raj 24 : 1960 Raj LW 565 : (1961) 1 Cr LJ 155.
23. *Nanhku Singh v State of Bihar,* AIR 1973 SC 491 : 1972 SCD 793 : 1972 Cr LJ 1204.

> *the factum of the firing at the place where the injured persons were, cannot be rejected. It cannot be held that the witness is a liar and he wanted to falsely implicate the appellant and others.*

Again in *Nihal Singh v State of Punjab,*[24] an argument regarding contradiction between medical evidence and direct evidence was repelled by their Lordships of the Supreme Court in this way—

> Another fact relied upon by the learned additional sessions judge in discrediting the eyewitnesses is that the witnesses stated that the deceased gave a *takwa* blow on the head of Nihalsingh, but the medical examination showed only a small abrasion on his left thumb. The High Court explained that the witnesses must be describing only the movements of the accused with their weapons and they could not obviously give evidence as to where a particular weapon hit the body for that would depend upon not only the manner in which the person wielded their weapons but also on the movement of the victim. A hit aimed at the head may, if the victim moves aside, miss altogether the body of the victim or fall on a part of his body different from that aimed at. There is certainly force in what the High Court said.

Applying the reasoning adopted by their Lordships of the Supreme Court in the cases cited above, the so-called contradiction or conflict between medical evidence and direct evidence pointed out by the learned counsel in the present case is, in our opinion, clearly explicable. May be, that the second shot did not hit the victim and the witness may have got an impression that the shot hit the victim at the back. May be, that only a few pellets of the second shot hit the victim and the rest went amiss. In our opinion, nothing turns upon this so-called contradiction or conflict between medical evidence and direct evidence.

In respect of PW/5, Smt. Jannat's statement learned counsel has drawn our attention to another discrepancy and it is this that Smt. Jannat states that the victim was at a distance of about one-pace (roughly five feet) from the muzzle whereas according to PW 3 Khanu the accused fired the gunshot which hit Gamu from a distance of about six to seven paces. In our opinion, nothing substantially turns upon the discrepancy in the distance. In *Janak Singh v State of Uttar Pradesh,*[25] their Lordships of the Supreme Court observed as follows:—

> *According to Dr. Ghosh's evidence, none of the three entry wounds showed any blackening or tattooing. Obviously, therefore, the firing did not take place from a very close range but from some distance at least. No doubt, the three eye-witnesses gave different distances ranging from two to six paces. But they could hardly be expected to have marked at the time the precise distance at which the person shooting the firearm was. They, therefore, gave an estimate of the distances at which he was from the victim. It is no wonder that the distances they deposed varied. Nothing can, therefore, turn on such variation.*

In this connection, learned counsel has laid much emphasis on the fact that no blood marks were found either in the hut of Fatehsingh-wali, where the first shot is alleged to have been fired, nor outside the hut up to the place where the victim fell after the alleged second shot. Learned counsel has argued that looking to the size of the wound caused by the first shot, there must have been profuse bleeding and some blood must have fallen on the ground. But since there is no evidence that there was any blood either in the hut or on the way, the direct evidence is false. In our opinion, the argument, though it appears attractive, has no substance. We have it in the evidence that due to winter season the deceased was putting on shirt and woollen coat. Further he had pressed the wound while running with both of his hands. The clothes of the victim were found hardly soaked with blood and it is quite possible that no such quantity of blood may have fallen either in the hut or on the way as may be collected for the purpose of investigation. A lot of blood spread out at the place where the victim fell. It is also possible

24. *Nihal Singh v State of Punjab,* AIR 1965 SC 26 : (1964) 4 SCR 7 : (1965) 1 Cr LJ 105.
25. *Janak Singh v State of Uttar Pradesh,* AIR 1972 SC 1853 : (1973) 3 SCC 50 : 1972 Cr LJ 1177.

that the man might have bled internally after receiving the first gun-shot wound. Thus, in our opinion, absence of blood marks in the hut or on the way is sufficiently explained.[26]

> 2. In other words, the position is that if we discard this part of the evidence of the eye-witness which has come to light for the first time in the Sessions Court, then according to medical evidence, the deceased would have got two gunshots whereas it was never the prosecution case that Ram Narain Singh or any other accused fired a second shot at the deceased at any time. The medical evidence, therefore, clearly falsifies the prosecution case regarding the manner in which the deceased was hit.

Even the ballistic expert on a question by the court deposed as follows:—

> In case if it is a straight fire, and if the right arm is kept just in front of the chest, then it is possible that these injuries could be caused by one single fire.

Thus, according to the ballistic expert's evidence, unless there was cogent material and reliable evidence to show that the deceased had kept his right arm in front of his chest, the deceased could not have sustained less than two injuries. The evidence of Surjit Singh and Joginder Singh on this point appears to us to be clearly an afterthought and cannot be accepted. Thus, the prosecution has not been able to explain how the deceased died by sustaining one gunshot injury. Furthermore, the evidence of Dr. SS Walia shows that there were two gunshot injuries on Teja Singh, namely, injury No. 1 which by itself was sufficient to cause his death, and injury No. 4 which was also the result of the gunshot. The doctor has further opined in his cross-examination that both injuries Nos. 2 and 4 could have been caused from a distance of less than 4 feet and that there was blackening both on injury Nos. 4 and 2, which were on the uncovered parts of the body. The doctor further deposed that there was corresponding burning of the shirt by injuries Nos. 2, 3 and 4. If this be the position, then injury No. 4 is not at all explained. The blackening on injury No. 4 clearly indicates that this was also a gunshot injury and the ballistic expert has also testified to the effect at p 60 of the High Court paper book that in case the blackening, which has been reported by the doctor in injury No. 2 and injury No. 4, were not the actual blackening due to the powder gases then it is possible that it could be from one single fire. The doctor, however, says nothing of this sort. Thus, a combined reading of the evidence of Dr. Walia, the medical expert and Mr. JK Sinha, ballistic expert, clearly establishes that the deceased died of two gunshot injuries and the prosecution has not been able to explain this important circumstance. For these reasons, therefore, the evidence of the two eye-witnesses Surjit Singh and Joginder Singh is wholly inconsistent with the medical evidence as also the evidence of ballistic expert and must be rejected on this ground alone, apart from other inherent improbabilities, which appear in their evidence and which have already been pointed out.

2.6.8 *Corpus Delicti*[27]

Mr. Banerjee has further urged that even if there was no body or trace of a body or any direct evidence as to the manner of death of a victim, the *corpus delicti* may be proved by other circumstances. He has referred in this connection to the case of *Arun Kumar Banerjee v State,*[28] Mr. PB Mukherji and Mr. NK Sen JJ, held in that case at pages 507 and 508 that:

> We cannot accept the broad proposition urged for the appellants that there can be no conviction on a charge of murder on circumstantial evidence …

In a decision of the English Courts in *Reg. v Onufrejczyk,*[29] Lord Goddard CJ, of England lays down the principle that in a trial for murder, the fact of death can be proved by circumstantial

26. *Hussain Khan v State of Rajasthan*, 1976 Cr LJ 821 : 1975 Raj LW 374 : 1975 WLN 587.
27. *Bhulakiram Koiri v State of West Bengal*, 1970 Cr LJ 403 : 73 Cal WN 467 : ILR (1969) 1 Cal 39.
28. *Arun Kumar Banerjee v State,* AIR 1962 Cal 504 : (1962) 2 Cr LJ 354.
29. *Reg. v Onufrejczyk,* (1955) 1 QB 388 : (1955) 1 All ER 247.

evidence … . The learned Lord Chief Justice of England lays down the further principle that notwithstanding that there is no body, or trace of a body, or any direct evidence as to the manner of death of a victim, the *corpus delicti* may be proved by such circumstances as render the commission of the crime certain and leave the jury with no degrees of doubt. That, in our view, presents the correct proposition and we respectfully agree with that statement of the law. In a later decision of the Supreme Court in the case of *Raghav Prapanna Tripathi v State of Uttar Pradesh,*[30] their Lordships observed at page 88 as follows:—

In *King v Horry,*[5] the head note states the law as follows:

> *At the trial of a person charged with murder the fact of death is provable by circumstantial evidence, notwithstanding that neither the body nor any trace of the body has been found and that the accused has made no confession of any participation in the crime. Before he can be convicted, the fact of death should be proved by such circumstances as render the commission of the crime morally certain and leave no ground for reasonable doubt; the circumstantial evidence should be so cogent and compelling as to convince a jury that upon no rational hypothesis other than murder can the facts be accounted for.*

This statement of the law was approved in *Reg v Onufrejczyk,*[3] except as to moral certainty and that statement of the law has received approval of the Supreme Court in *Anant Chintaman Lagu v State of Bombay*.[3127] It was also said in *R v Horry:*[32]

> That the jury, viewing the evidence as a whole, was entitled to regard the concurrence of so many separate facts and circumstances themselves established beyond all doubt, and all pointing to the fact of death on or about July 13, 1943 – as excluding any reasonable hypothesis other than the death of the person alleged to have been murdered and as having therefore sufficient probative force to establish her death.

We agree with the contention of Mr. Banerjee as a whole that the circumstances as proved in the present case are such that the *corpus delicti* has been proved thereby and even if not so, the commission of the crime and the relative offence charged can be established, if the circumstances on record lead on to establish the crime beyond reasonable doubt.

2.6.9 Corroboration[33]

We have found earlier that the High Court had discarded the evidence of eyewitnesses on superficial and unsubstantial ground. Apart from the fact that there were no justifiable grounds for rejecting their testimony, we are greatly impressed by the evidence of P.W. 1 and the substantial corroboration received by it from the First Information Report and the medical and the expert evidence. An examination of the First Information Report shows that Bakshish Singh was responsible for firing two shots at Karam Singh and one shot at Gurdeep Singh. He was alleged to have shot once at the legs and later again at the neck of Karam Singh and once on the right thigh of Gurdeep Singh. The medical evidence supports the evidence of P.W. 1 and what is more important is that the medical evidence is in tune with the First Information Report. The empty cartridges, which were found at the scene of occurrence, show that two of them found near Karam Singh and one found near Gurdeep Singh were shot from the Pistol of Bakshish Singh. The manner in which the medical evidence and the expert evidence fit in with the earliest version given by P.W. 1 in the First Information Report, to our mind, justifies our placing implicit reliance on her evidence.

30. *Raghav Prapanna Tripathi v State of Uttar Pradesh,* AIR 1963 SC 74 : (1963) 1 Cr LJ 70 : (1963) 3 SCR 239.
31. *Anant Chintaman Lagu v State of Bombay*, AIR 1960 SC 500 : (1960) 2 SCR 460 : 1960 Cr LJ 682.
32. *The King v Horry*, (1952) NZLR 111.
33. *Rama Nand v State of Himachal Pradesh,* AIR 1981 SC 738 : (1981) 1 SCC 511 : 1981 Cr LJ 298 (SC).

Although the High Court has held that the body recovered was that of Sumitra deceased and that the bones sent to the medical experts were not parts of the decomposed body found, but appeared to have been fraudulently replaced with the bones of a child during transmission to the medical experts, we would assume that the identity of the body found in the river was not established beyond reasonable doubt. In other words, we would take it that the *corpus delicti*, i.e., the dead body of the victim was not found in this case. But even on that assumption, the question remains whether the other circumstances established on record were sufficient to lead to the conclusion that within all human probability, she had been murdered by Rama Nand, appellant. It is true that one of the essential ingredients of the offence of culpable homicide required to be proved by the prosecution is that the accused "caused the death" of the person alleged to have been killed.

This means that before seeking to prove that the accused is the perpetrator of the murder, it must be established that homicidal death has been caused. Ordinarily, the recovery of the dead body of the victim or a vital part of it, bearing marks of violence, is sufficient proof of homicidal death of the victim. There was a time when under the old English Law, the finding of the body of the deceased was held to be essential before a person was convicted of committing his culpable homicide. "I would never convict", said Sir Mathew Hale, "a person of murder or manslaughter unless the fact were proved to be done, or at least the body was found dead". This was merely a rule of caution, and not of law. But in those times when execution was the only punishment for murder, the need for adhering to this cautionary rule was greater. Discovery of the dead body of the victim bearing physical evidence of violence, has never been considered as the only mode of proving the *corpus delicti* in murder. Indeed, many cases are of such a nature where the discovery of the dead body is impossible. A blind adherence to this old "body" doctrine would open the door wide for many a heinous murderer to escape with impunity simply because they were cunning and clever enough to destroy the body of their victim. In the context of our law, Hale's enunciation has to be interpreted no more than emphasising that where the dead body of the victim in a murder case is not found, other cogent and satisfactory proof of homicidal death of the victim must be adduced by the prosecution. Such proof may be by the direct ocular account of an eye-witness, or by circumstantial evidence, or by both. But where the fact of *corpus delicti*, i.e., "homicidal death is sought to be established by circumstantial evidence alone, the circumstances must be of a clinching and definitive character unerringly leading to the inference that the victim concerned has met a homicidal death. Even so, this principle of caution cannot be pushed too far as requiring absolute proof. Perfect proof is seldom to be had in this imperfect world and absolute certainty is a myth. That is why under section 3, Evidence Act, a fact is said to be "proved", if the court considering the matters before it, considers its existence so probable that a prudent man ought, under the circumstances of the particular case, to act upon the supposition that it exists. The *corpus delicti* or the fact of homicidal death, therefore, can be proved by telling and inculpating circumstances which definitely lead to the conclusion that within all human probability, the victim has been murdered by the accused concerned. In the instant case, circumstances (1) to (5) in their cumulative effect, are not only inconsistent with the innocence of Rama Nand appellant, but ineluctably and rationally compel the conclusion that Sumitra has died and it is Rama Nand appellant who has intentionally caused her death. Circumstance (3) involves an admission by Rama Nand and Shish Ram accused that Sumitra has met an unnatural death. The only difference between the prosecution version and the defence version is as to whether Sumitra committed suicide or had been killed by Rama Nand appellant. It has been found that the story of the suicide set up by the accused is false. The articles Salwar (Ex. P-14) and the Shoes (Ex. P-15) do not belong to her. They were planted by the accused to lay a false trial and to misdirect the investigation. This circumstance taken in conjunction with the others, irresistibly and rationally leads to the conclusion that she has been

murdered by Rama Nand appellant and her dead body has been disposed of by the appellant Shish Ram and Kali Datt.

2.6.10 Third Degree Methods[34]

It is plain common sense that suspects are seldom willing to furnish a quick and correct clue to the crimes for which they are arrested. A certain amount of coaxing and promising has inevitably to be done in order to persuade the accused to disclose at least the outlines of the crime. But the use of strong methods of investigation, apart from raising problems concerning the observance of decency in public affairs and of human dignity, is fraught with the danger that the very process by which evidence is collected may become suspect and fail to inspire confidence. Ganpat, the approver, was driven to admit that he was tortured while in the lock-up and we have serious doubts whether the injury caused on his head was, as alleged by the police, self-inflicted. A witness called Ramchandra also admitted that while under interrogation the police pulled out his pig tail. We have registered the failing which tempts even judicially trained minds to revolt against such methods and throw the entire case out of hand. But we must, with hopes for the future, utter a word of warning that just as crime does not pay, so shall it not and witnesses during the course of investigation. History shows that misuse of authority is a common human failing and, therefore, courts must guard against all excesses. The police, with their wide powers, are apt to overstep their zeal to detect crimes and are tempted to use the strong arm against those who happen to fall under their secluded jurisdiction. That tendency and that temptation must, in the larger interests of justice, be nipped in the bud.

On the question whether the remarks that accused was injured are justified, we have also perused the medical report of the chief medical officer dated 11 May 1968 from which it is evident that he had found six injuries on the accused, and one of them was such that he advised X-ray though later it was found that there was no fracture. The nature of these injuries as well as the condition of the accused at the time when he was produced before the learned judge fully justify the conclusions that the accused when produced before the court was found "suffering grievously from the after effects cumulatively of those injuries".

In our view there is no warrant for the submission that the appellants were not given an opportunity to explain nor that no enquiry could be made. The appellants had opportunity of filing their affidavits and to give their version which they have done in great detail, which shows that they knew what the allegations against them were. If they wanted to produce any other person in support of their stand that the accused was only arrested on the 10th and not on the 5th or that the injuries found on the accused were old and were not fresh they could have done so. They do not deny that the chief medical officer examined the accused nor is it possible for them to say how the injuries found on the accused some of which were fresh could be caused. They were certainly not old injuries nor is it their case that when the accused was arrested on the 10th he was found to be suffering from swollen feet or injuries which were fresh. None of the remarks to which exception has been taken, in our view could be described as unwarranted, unnecessary, or irrelevant or can be characterised as generalisation or of a sweeping nature. There is, therefore, no ground for granting the prayer for expunging any of the remarks in the order of the High Court. In this view the appeal is dismissed.[35]

There is not the remotest possibility of these injures being caused in any other way except by third-degree methods. The site of injuries 2 and 3 on Amin makes it highly probable that he was struck repeatedly with a blunt weapon in the soles of his feet. There is also a strange symmetry in the injuries of Shakira, which indicates a planned beating, and she was subjected to a greater torture because she was weaker and more likely to break and confess.

34. *Dagdu v State of Maharashtra*, AIR 1977 SC 1579 : 1977 Cr LJ 1206 : (1977) 3 SCC 68.
35. *Jage Ram v Hans Raj Midha*, AIR 1972 SC 1140 : (1972) 1 SCJ 272 : 1972 Cr LJ 768 (SC).

We have occasionally commented upon the questionable methods adopted by the investigating officer in investigating crimes, but Sri Naim seems to us to be one of the most outstanding and brilliant exponents of the cult of baton even amongst his own special class.

The trial court while discussing these injuries observed:

> However, the injuries on the person of Shakira are quite large in number and suggest that she was probably beaten after her arrest. That may have been done to extract confession from her on 16-6-1956, but there is no confession on the record and in any event the beating given to her after being brought to police station from Imalia on 16-6-1956, is not material so far as the merits of the case are concerned.

The line of reasoning adopted by the trial court apart from being fallacious shows a lamentable lack of judicial approach. It shows an alarming tendency practised by so many judicial officers, namely averting the eyes so that the unpleasant truth may not be seen. Justice cannot be divorced from truth and the first duty of a person who is entrusted with the task of administering justice is to do his best to reach the truth.

But it is a sad commentary on the existing conditions that even the most glaring misbehaviour of the investigating agency in criminal cases quite frequently goes unnoticed by the trial courts and instead of severely condemning these practices, they go to the length of accepting spurious explanations offered by the prosecution. They do not seem to realize that by this attitude they not only encourage but contribute to the non-observance of the rule of law.

Apart from the injuries discussed above there is another important piece of evidence which strongly corroborate the contention of the appellants that they were arrested earlier and not on the morning of the 16th of June. When Shrimati Shahida (P.W. 2) was examined before the magistrate she stated that on the third day of disappearance of Nabbo the sub-inspector came with Shakira and searched her house. Shrimati Zaibun (P.W. 3) went a stage further and stated before the magistrate that the ornaments were recovered on the third day of disappearance. Both these witnesses denied their earlier statements, but could not explain how they came to be recorded.

The trial court attached no importance to these statements on the ground that witnesses were simple village women who were led to make these statements by clever cross-examination. In our opinion these two witnesses in an unguarded moment blurted out the truth and then they were made to disown statements in the interests of the prosecution.

These statements clearly prove that the appellants were not arrested on the morning of the 16th of June and Naim fabricated the police records in order to hide the illegal detention of the appellants for several days. He staged their arrest on the morning of the 16th of June when he had broken their resistance by third-degree methods and they were ready to make disclosures.

To sum up our conclusions, we find that Naim committed perjury in order to hide his intimacy with and the influence over the witnesses. He safely used them to fabricate links of circumstantial evidence. He arrested the appellants probably on the 13th of June but in order to subject them to compulsion for some days he fabricated the police records and staged a fictitious arrest on the morning of the 16th June. Lastly, by methods of torture, he got disclosures. It is in this background that we will assess the remaining four pieces of circumstantial evidence.

2.6.11 Police Padding[36]

The accused is said to have made a disclosure statement (as per Exhibit P.W. 10-A) to the police inspector Bhim Singh (P.W. 16) that he had kept the knife near Chhaju Colony, Shahdara

36. *Bhola Nath v State,* 1976 Cr LJ 1409.

adjacent to a coconut tree in the field in the bushes and that he would get the same recovered after pointing it out. This statement is said to have been made in the presence of Shuja Uddin (P.W. 10) and Mohd. Asfeen (P.W. 11) which was seized under a memo (Ex. P.W. 1-C). The said knife was not even sent for serological examination because it was not said to contain bloodstains. It was not shown to the doctor who conducted the post-mortem or even to any other doctor who was examined. The learned Additional Sessions Judge rightly did not attach any weight to the recovery of the said knife in the view that it did not contain bloodstains. Without any bloodstains on it there is no guarantee that the same was used in this case. It is needless, therefore, to be detained by the said recovery even though Mr. Frank Anthony, learned counsel for Bhola Nath, went the length of contending that a knife had been "falsely planted" by the police in this case.

2.6.12 Stock Witness[37]

Who will police the police? Is freedom of movement unreasonably fettered if policemen are given power of externment for public peace? These twin problems of disturbing import, thrown up by this bizarre case, deserve serious examination.

Certain facts emerge as fairly probable from the affidavits of both sides. Prem Chand made a living as a *paniwala* or vendor of soft drinks near Delite Cinema even as a teenager, which shows that he had very poor beginnings. How did he fall into thralldom of the local police? He explains it in his affidavit:

He had a few mobile carts which were used for refrigerating water. These carts used to be parked by the petitioner on the road side due to the indulgence of the police. He was in his teens when he started his avocation and continued for a very long time. Thus, he acquired an *alias*, i.e., Prem Chand Paniwala.

Due to close association with police and their connivance and indulgence, the petitioner thrived. In this process, the petitioner became a pray and pawn in the hands of the police. He was persuaded to be their perpetual stooge and stock witness.

The petitioner in the year 1956, when he was 25 years' old was involved in a gambling case by the police to mould him a permanent stock witness and lest he should be militant to defy them. Despite his hesitation and unwillingness he was forced to become a permanent pawn of the police. This is how, the petitioner landed himself in the web of the police; he had no alternative than to be like that as his livelihood was dependent upon the mercy and indulgence of the police.

The version of the petitioner is that once he yielded to the pressure of the police to give false testimony disclosing a rubberised conscience and unvoracious readiness to forswear himself, there was escalation of demands upon him and he became a regular paddler of perjury "on police service". Indeed, counsel for the petitioner argued that his client was a "stockwitness" because he had to keep the police in good humour and obliged them with tailored testimony in around 3,000 cases because the alternative was police wrath. We were flabbergasted at this bizarre confession but to lend credence to his assertion counsel produced a few hundred summonses where the petitioner was cited as a witness. Were he not omnipresent, how could he testify in so many cases save by a versatile genius for loyal unveracity? For sure, the consternation of the community at this flood of perjury will shake its faith in the veracity of police investigation and the validity of the judicial verdict. We have no doubt that the petitioner, who has given particulars of a large number of cases where he had been cited as witness, is speaking the truth even assuming that 3,000 cases may be an exaggeration. In

37. *Prem Chand v UOI,* AIR 1981 SC 613 : (1981) 1 SCC 639 : 1981 Cr LJ 5 (SC).

justice, justices and justicing and likewise in the police and policing, the peril to the judicial process is best left to imagination if professional perjurers like the self-confessed Paniwala are kept captive by the police, to be pressed into service for proving "cases". Courts, trusting the police may act on apparently veracious testimony and sentence people into prison. The community, satisfied with such convictions, may well believe that all is well with law and order. We condemn, in the strongest terms, the systematic pollution of the judicial process and the consequent threat to human rights of innocent persons. We hope that the higher authorities in the department who, apparently, are not aware of the nefarious activities going on at the lesser levels will immediately take measures to stamp out this unscrupulous menace.

The petitioner's reply affidavit makes startling disclosures about the police methods of implicating innocent people. However, the version of the petitioner can hardly be swallowed since he is a self-confessed perjurer. Nevertheless it is not too much to ask government to take effective measure to prevent police methods straying into vice. We hopefully remind the state about what Brandiase J once observed; *Olmestead v US.*[3836]

> *Crime is contagious. If the government becomes a law breaker, it breeds contempt for law"...."To declare that in the administration of the criminal law the end justifies the means to declare that the government may commit crimes in order to secure the conviction of a private criminal would bring terrible retribution. Against that pernicious doctrine this court must resolutely set its face."*
>
> In the same American decision we have just mentioned Justice Holmes observed; "We have to choose, and for my part I think it a less evil that some criminals should escape than that the Government should play an ignoble pact.

2.6.13 Voluntary Confession[39]

The accused was arrested on 3 June 1974. The Superintendent of Police (C.I.D.) made a written request to the Magistrate for recording the confession of the accused. The Magistrate passed an order that the confession would be recorded on the following day and directed that the accused be brought from the judicial lock-up on 14 June 1974, and produced before him at 7 a.m. On 14 June 1974, the accused was accordingly produced from the judicial lock-up in the morning and produced in the court before the Judicial Magistrate. After detailed preliminary questioning and warning, the Magistrate gave about 15 minutes more for reflection to the accused. When, as a result of these preliminary proceedings, he was satisfied that the confession was being voluntarily made, he started recording the confessional statement of the accused at about 8.45 a.m. After first recording the confession in another case, the Magistrate recorded the confession of the accused, pertaining to the murders in the instant case. The Magistrate put pointed and searching questions to the accused to ensure that the confessions were being made voluntarily. He specifically asked the accused about the date of his arrest and the period of detention in police custody. He then asked him how the police had treated him during the police custody. The accused replied in categorical terms that he had not been beaten or maltreated or threatened by the police. The Magistrate asked the accused:

> *Whether you were told if you made the confession you would be released or pardoned or that you would get any other benefit?*

The accused replied,

> I was not told that if I made the confession I would be released or pardoned or that I would get any other benefit.

38. *Olmestead v US,* (1928) 277 US 438 : 72 Law Ed 944 : 48 S Ct 564.
39. *Som Parkash v Delhi Administration,* 1974 Cr LJ 784 (SC).

The Magistrate explained to the accused that in no case, whether or not he made a confession, his custody would be handed over to the police. To this, the accused replied:

> I am making confession out of my free will. I have understood.

The Magistrate further explained in clear, unmistakable terms to the accused that he was not bound to make a confession and if he did so, the confession might be used as evidence against him. After giving the accused 15 or 20 minutes more for reflection, the Magistrate recorded the confession of the accused, at first the one relating to the other case, and thereafter, the confession pertaining to the instant case.

A circumstance also taken into consideration by the Supreme Court assessing its voluntary character was that the confession was not retracted at the earliest, it was made on 14 June 1974. The trial commenced on 10 January 1975 when the charges were framed and read over to the accused. This was the earliest opportunity at which he could retract the confession, particularly when he was defended by an experienced counsel. But he did not do so on this occasion, though he pleaded not guilty to the charges.

The accused was examined under section 313, Code of Criminal Procedure on 14 June 1977. It was on this day, during his examination, he, for the first time, retracted the confession. He denied even the *factum* of making this confessional statement (Exhibit P-39) when the same was read over to him. In this connection, he stated:

> I was not in senses at that time. He was severely beaten by the police and was forced to appear before the Magistrate. Therefore, what had happened, I did not know because I had become unconscious. I was intoxicated with wine in the Rest House Raisinghnagar before I was produced before the Magistrate. I was produced before the Magistrate in a state of intoxication.

This belated plea of beating by the police was not credible. No question was put to the investigating officers S Shri Kashi Prasad Srivastava (P.W. 16) and Bhanwar Lal (P.W. 18), in cross-examination, to show that they had beaten, threatened, or otherwise induced the accused to make the confession.

Equally unfounded was the plea that wine was administered to him (by the police) in the Rest House before producing him before the Magistrate for recording the confession. Firstly, the accused was in the judicial lock-up for the preceding two days, from where he was brought under the orders of the Magistrate and produced at 7.15 a.m. Secondly, if the accused was then dead-drunk, this fact could not have escaped the notice of the Judicial Magistrate.

The Magistrate, Bansal was examined as P.W. 7. One of the questions put to him in cross-examination by the defence was:

> Did you enquire from the accused as to how the police had meted out good treatment to him?

Shri Bansal replied:

> The accused did not tell me that the police had given him wine, meat and thus treated him well.

He stated that good treatment was meted out to him.

The story propounded by the accused that at the time when he was produced before the Magistrate for recording his confession, he was dead-drunk that he did not know what he was doing was too fantastic to be believed. If the accused was then reeking of alcohol and unfit to make a statement as he wanted to have it believed, the Magistrate would not have failed to note this fact. It is impossible to believe that the confessional statement was not made by the accused but was cooked up by the Judicial Magistrate himself.

Mr. SK Bansal was further questioned:

> Did you believe that the police had assured the accused that in case he made the confession, he would be pardoned and that, he would not be challenged in this court?

Bansal refused this suggestion, stating:

> I had put questions in this regard to the accused to which he replied that the police had not assured him that if he made the confession, he would not be charged or pardoned. I was convinced from his replies that he was making, *i.e.,* statement voluntarily and not under any pressure or inducement.

It was, therefore, held that the confession was voluntary.

2.6.14 Trustworthiness of Police[40]

The appellant's general denunciation of investigating officers as a suspect species also ill merits acceptance. The demanding degree of proof traditionally required in a criminal case and the devaluation suffered by a witness who is naturally involved in the fruits of his investigating efforts, suggest the legitimate search for corroboration from an independent or unflattering source – human or circumstantial – to make judicial certitude doubly sure. Not that this approach casts any pejorative reflection on the police officer's integrity, but that the hazard of holding a man guilty on interested, even if honest, evidence may impair confidence in the system of justice. We are aware of the exaggerated criticism of the police force as a whole and of the reluctance of the framers of the Criminal Procedure Code to trust statements recorded by police investigators but these are, partly at least, the hangover of the British past. Today, trust begets trust and the higher officers of the Indian police, especially in the Special Police Establishment, deserve better credence. We are certainly inclined not to swallow the evidence of P.Ws. 7 and 8 without scrutiny but after having heard the appellant at length, we are prepared to agree with the High Court that the evidence of P.Ws. 7 and 8 are substantially correct. Even here, we must underscore the importance of the findings of the trap experiment, since they go a long way to underwrite the veracity of the prosecution story[41].

The learned sessions judge has taken up the attitude of distrust towards the police for which it is difficult to find any justification in the evidence — an attitude which I regret to say, is becoming a growing feature of judgments of subordinate magistrates. When at the trial it appears to the court that a police has in the discharge of his duty, abused his position and acted oppressively, it is no doubt its clear duty to express its stern disapproval of his conduct. But it is equally its duty not to assume such conduct on the part of the officer gratuitously and as matter of course when there is, and in this case, no reasonable basis for it in the circumstances. The presumption that a person acts honestly applies as much in favour of a police officer as of other persons and it is not a judicial approach to distrust and suspect him without good grounds. Therefore, such an attitude could do neither credit to the magistracy nor good to the public. It can only run down the prestige of the police administration.[42]

The learned magistrate held that the other two prosecution witnesses Bant Singh, Head Constable, P.W. 4, and Kuldip Singh, excise inspector, P.W. 3, are public servants and are, therefore, naturally interested in the success of the case and their evidence cannot be held to be sufficient to prove the prosecution story. This approach is wholly wrong and incorrect. It is well-settled that *prima facie* the public servants must be assumed to act honestly and conscientiously. It would, therefore, be basically wrong, without other cogent ground, to consider them as untrustworthy witnesses in respect of their activities in performance of their

40. *Som Parkash v Delhi Administration,* 1974 Cr LJ 784 (SC).
41. *Som Parkash v Delhi Administration,* 1974 Cr LJ 784 (SC).
42. *Aher Raja Khima v State of Saurashtra,* 1956 Cr LJ 421 (SC).

official duties merely because of their official status unless the evidence is considered to be suspicious and that conviction of the accused cannot be sustained on the statements of official witnesses. The presumption that a person acts honestly applies as much in favour of a police officer as of other persons, and it is not a judicial approach to distrust and suspect him without good reasons. It appears that the magistrate was bent upon acquitting the accused somehow or the other. No doubt, the owner of the scooter recorded in the papers recovered from the accused was one Krishan Lal of Ludhiana, but it is immaterial for the purpose of this case because the possession of the scooter and the opium by the accused is established beyond reasonable doubt from the evidence on the file.[43]

2.6.15 Immediate Dispatch

The prosecution alleged that the accused at the time of his arrest was wearing a shirt and a waist coat which had bloodstains on them. This was a very strong piece of incriminating evidence against the accused. But the investigating officer simply bungled. He should have, the moment he had recovered the alleged bloodstained shirt and waist coat from the accused, sealed them in the presence of witnesses and sent them on to the chemical examiner for analysis. But for a number of days he allowed the shirt and the waist coat to remain with himself.

We have no other alternative than to exclude from consideration the evidence regarding the bloodstains[44].

Another feature of corroboration can be mentioned. Fauja Singh, P.W. 14, who tracker-lifted three footprints from the spot and two footprints at a distance of 12 *kadams* from there, and these were found to be of the *Gurgabis* which had been taken into possession from the feet of Sarbjit Singh and Bahadur Singh. Both Sarbjit Singh and Bahadur Singh were asked to walk on the ground with these shoes and their footprints were also lifted for examination for the expert. Mr. Longia P.W. 12, Assistant Director, Forensic Science Laboratory, Chandigarh, received the moulds and the shoes for examination on 3rd and 6th of November 1967. Five crime moulds and four test moulds were brought to him. The test moulds were in an unsealed condition, these being marked T. 1 to T. 4. The shoes which were also in an unsealed condition were marked section 1 to section 2. These exhibits had been kept too long with the police to impart confidence in the evidence of the expert. What has been frequently said by this court is repeated in *Mohinder Singh v State of Punjab*[45].

That the police should not wait for the recovery of the actual weapon of offence before sending the empty cartridges or bullets, which are found near the scene of occurrence for expert examination. No ground should ever be allowed for the attack by the defence that there was an opportunity for tampering with these empty cartridges while they remained in police custody.

On a parity of reasoning, the same principle should apply in the instant case where there was a long interval between the lifting of moulds and their dispatch to the expert. Whatever value there is of the comparison is lost altogether when we find that the shoes as well as the crime moulds were in an unsealed condition.[46]

2.6.16 Identification Marks[47]

The police should be careful, when sending exhibits to the chemical examiner, to mark each one in such a way that its identity can be fixed and safeguarded throughout, and to specify the

43. *Rameshwar Dass v State of Punjab,* 1975 Cr LJ 1630. Also see *Pritam Singh v State of Punjab,* 1964 Cr LJ 39.
44. *Ali Shan v State of Jammu and Kashmir*, AIR 1954 J&K 42 : 1954 Cr LJ 1124..
45. *Mohinder Singh v State of Punjab,* (l961) 63 Punj LR 434.
46. *Sarabjit Singh v State of Punjab*, 1970 Cr LJ 954 (P&H).
47. *Kala v State of Punjab*, 1948 Cr LJ 660 (Lah).

origin and ownership of each in the covering letter to the chemical examiner. Care should also be taken to see that the evidence tendered in court establishes beyond doubt the origin and ownership of each exhibit sent for examination.

2.6.17 Chain of Custody[48]

In the first place he (the learned counsel for Motia) points out that there is no evidence to show that after the various articles had been recovered from the possession of Motia they were kept sealed so that it was not possible for anyone to sprinkle bloodstains on them while they were in the custody of the police and before they were sent for examination to the chemical examiner. We must point out that this lacuna in the prosecution evidence is there. Whenever it is desired by the prosecution that certain articles, which have been recovered from accused persons, are to be identified, or are to be sent to the chemical examiner for analysis, it is necessary that the officer recovering the articles should immediately take steps to seal them and evidence should be produced that the seals were not tampered with till the identification is over, or till the articles are sent to the chemical examiner for analysis. In the absence of such precautions it would always be open to the accused to say that the police later put human blood on the articles in order to implicate the accused. It is, therefore, necessary for the prosecution to produce evidence that steps were taken at once to seal the articles, and that from the time the articles came into the possession of the police to the time they were sent for identification before a magistrate or for examination to the chemical examiner the seals remained intact. The evidence is missing in the case.

We do not say that this was done in the present case; but as precautions were not taken, the argument raised on behalf of the accused that this might have been done, remains unrefuted. Under the circumstances we cannot place the same reliance on the discovery of bloodstains on these various articles as we would have done if necessary precautions had been taken.

Another point that has been urged is that though it is proved that these articles were recovered from the possession of the accused, and that they are the articles which are before the court, there is no proof that these were the particular articles which were sent to the chemical examiner for examination. We must say again that this lacuna also remains. Evidence should have been produced that these articles recovered from Motia accused were sent to the chemical examiner. All that the letter of the chemical examiner. Ex. M-33 shows that a parcel containing certain things was received by him; but there is nothing to show that these are the very things which were recovered from Motia's possession.

2.6.18 Delay in Dispatch[49]

I would have attached great importance to the evidence of the Imperial Serologist in regard to the detection of bloodstains on the trousers and the shirt, which the appellant was wearing at the time when he was arrested, but I feel impressed by the argument advanced by the learned counsel appearing as *amicus curiae* in this case that the delay in dispatching these articles to the chemical examiner and the absence of the evidence that these articles were sealed and dispatched in the presence of the appellant and respectable witnesses is fatal to the prosecution so far as this point is concerned. These articles were seized from the possession of the appellant on the evidence of 17th Phagan, 2006 at Thana and they were packed, sealed and dispatched to the chemical examiner on 22nd Phagan, *i.e.,* six days after they had remained in the possession of the police. Where is the guarantee that these clothes were not tampered with

48. *State of Rajasthan v Motia*, AIR 1955 Raj 82 : ILR (1953) 3 Raj 655 : 1955 Cr LJ 837.
49. *Abdul Salam v State of Jammu and Kashmir*, 1953 Cr LJ 1587.

during this long interval? In a similar case reported as "1 J&K LR 37 (A)" the learned Chief Justice, the late Mr. Rachhpal Singh J observed as follows at page 42:

> *In a case like this what happens generally is that the police immediately in the presence of witnesses takes possession of the articles containing bloodstains and at once seals them so that it is not open to the accused to come out with the defence that these bloodstains might have been placed there by the police. In the present case the door leaves were for several days in the custody of the police and it is possible that somebody connected with the prosecution might have placed these stains on them.*

Observation is fully applicable to this case. The learned counsel for the appellant has rightly drawn our attention to this glaring defect and I am afraid it would not be correct to exclude the possibility of the stains having been put subsequently on the clothes in this case. As it is, these stains cannot furnish any corroboration of the retracted confession. Apart from it, the appellant had more than 24 hours to wash his clothes and remove the stains. It is not the prosecution story that the idea did not occur to him. On the other hand, the story for the prosecution is that the appellant had washed his *loi,* Ex. P. 3 during the interval. It is, therefore, strange that he should not have washed his shirt and trousers and wandered about with these stains on. Even on this score doubt about the stains having been found on the clothes on the 16th Phagan cannot be altogether eliminated.

2.6.19 Seals on parcels intact[50]

Lastly, Mr. Kartar Singh Raipuri, learned counsel for the respondent argued that no signatory chit of any person was placed in the sealed samples of the opium sent to the chemical examiner and, therefore, it cannot be said that the samples sent were of the opium recovered from the accused. This contention is devoid of force and is repealed. The four sealed samples of the opium recovered from the respondent were deposited by Bant Singh, head constable, P.W. 4, on 4 September 1970, in the malkhana of police station, Sunam, with Ajaib Singh, Moharrir constable with seals intact. On 7 September 1970, Ajaib Singh, Moharrir head constable handed over the four sealed parcels containing samples of the opium with seals intact to Mistri Singh, constable for depositing the same with the chemical examiner, Punjab Government, Patiala. Mistri Singh, constable, took the sealed samples from Ajaib Singh, Moharrir head constable, went to the office of the excise and taxation officer at Sangrur and obtained a letter written in Punjabi from there and then took these four sealed samples to the office of the chemical examiner, Punjab Government, Patiala, and obtained a receipt from there which he handed over to Ajaib Singh, Moharrir head constable.

So long as the sealed parcels of the opium recovered from the respondent remained in possession of Ajaib Singh, Moharrir head constable and Mistri Singh, constable nobody tampered with them. These facts are proved from the affidavits Exhibit PF and PG of Ajaib Singh, *moharrir* head constable and Mistri Singh, constable. The chemical examiner, Punjab Government, Patiala, in his report Exhibit PE, gave the opinion that the contents of all the four samples are opium. He further stated that the seal on each sample was intact and it agreed with the sample seal sent to him. It is thus clear that the samples of the opium recovered from the accused Rameshwar Dass reached the chemical examiner with seals intact.

50. *State of Punjab v Rameshwar Dass*, 1975 Cr LJ 1630 : 1974 Punj LJ (Cri) 383 : 77 Punj LR 189.

Court on Report

It is difficult to see how reliance can be placed on the opinion unless it is supported by good reasons founded on the facts that warranted that opinion. If the reasons are good and convincing, and the factual data on the basis of which the opinion is formed, warrant the opinion, the court will rely on the opinion.

Gujarat High Court

3.1 TRIALS

The trial, in legal parlance, relates to the adjudication process of a dispute in which a person(s) is judged for being responsible for a dispute/conflict/crime. Here the opposing parties come to court, present evidence to support their cases and the court adjudicate the claims of the parties on the bases of the evidence. Trial is a legal formal process. The adjudicator may be a judge and/or a jury. In India, only judges hold the trials without juries. This type of trial is called a Bench Trial. If a jury is also involved, it is Jury Trial. Judge Trials are faster than Jury Trials.

There are appellate courts, which hear an appeal against the verdict of the trial courts. They do not conduct trials.

Modern trials are divided into two categories: criminal trials and civil trials. The former relates to crimes and criminals. Usually, the government is a party to such trials. The latter relates to civil cases usually relating to property, claims and other non-criminal disputes. The Criminal Procedure Code and the Civil Procedure Code regulate criminal and civil trials, respectively.

Criminal trials are of two types: adversarial and inquisitorial trials. In the former, the suspect is accused and the accusing party (usually government) produces evidence to prove the guilt. The accused defends him by producing defence evidence and arguments to negate the incriminating evidence. The judge appraises the evidence from both sides and decides the guilt or innocence of the accused.

In the inquisitorial system, the judge investigates as well as adjudicates the criminal case. He collects evidence, interrogates witnesses and the accused. Both the prosecutor and defence lawyers have a limited role to play in this system.

In India, the adversarial system prevails. Both the parties try to put up such evidence that favours them. Presumption of innocence is fundamental in the system until proved otherwise. The burden of proof lies on the prosecution.

Cross-examination of witnesses is considered the acid test to ascertain the truthful evidence and hallmark of the system.[1] However, moneybags hire loudmouths and *Golu* (liar) witnesses, hoodwink the court and often win the day.

1. *Suleman Usman Memon v State of Gujarat,* AIR 1961 Guj 120 : (1961) 2 Cr LJ 78 (Guj).

In the adversarial system of trials, the burden of proof is on the prosecution. The person facing the trial need not say a single word about the crime, his involvement, or his innocence. The prosecution must prove the case beyond reasonable doubt. The proof often falls short of the *dictum* "beyond reasonable doubt"[2] in the eyes of most of the judges, especially in serious cases. The benefit goes to the accused. Many criminals, thus, are let loose in the society.

The presumed innocence of the accused and "beyond reasonable doubt" in our judicial system, unfortunately, is magnified too much. This reasonable doubt is an uncanny entity and it cannot be delineated/specified in tangible terms. It varies from person (judge) to person (judge). It is responsible for variations in the judicial pronouncements in the same case (appeals upon appeals) or in similar cases, in different courts. That is how we have convicting judges and the acquitting judges. In some High Courts, the clever counsels manipulate to get their cases put up before the non-convicting judges, often leading to miscarriages in the delivery of justice.

It is hoped that scientific proof in trials might decrease the blasphemous abuse of the favourite phrase:

The proof is not beyond a reasonable doubt

"Justice delayed, justice denied" is another serious problem in judicial trials. The cases linger on, sometimes for decades. Under-trials, especially person from the weaker section of the society remains in jails awaiting trial for years. The inadequacy in men and materials in the dissemination of justice is unfortunate. The sanctioned staff strengths are too low everywhere. To add to the misery, a substantial number of posts remains vacant for years. They lack proper selection process and the initial/periodic training. There is no audit/accountability of their working especially on their honesty. Many of the entrants have entered through corrupt means. The government just sleeps over the problems.

Certain court conventions also hinder the delivery of real justice in the trials. They are, therefore, worrisome. They are:

- The eyewitness accounts evidence are the best evidence.
- A thousand culprits may get acquitted but not even one innocent person be punished.
- The benefit of doubt goes to the accused. He gets an acquittal.

3.2 EVIDENCE

The major types of evidence used in a criminal trial are:

1. Eyewitness accounts
2. Confessions
3. Approvers evidence
4. Stock witnesses
5. Circumstantial evidence
6. CCTV evidence
7. Mobile phone evidence
8. Noetic sciences (Brain profiling/fingerprinting evidence/ Psychological Detection of Deception/ Narco-analysis) evidence

2. The phrase is frequently used by the escapist. It is responsible for about 90% of the acquittals in heinous crimes in India.

9. Criminal profiling
10. Surveillance: digital videography, photography, and sound surveillance
11. Evidentiary clues

3.2.1 Eyewitness Accounts

The eyewitness accounts relating to a crime are given by eyewitness(es) victim(s), approver(s) or by the culprit(s) in his confessional statement.

The courts in India depend mostly on the eyewitness accounts. Apparently, the evidence of the eyewitnesses appears to be the best evidence. If a person has witnessed the occurrence, the same should be the best evidence. However, it has been proved, time and again, that this evidence suffers from a number of infirmities:

- The eyewitness observes the occurrence for a short period.
- He may not have observed the complete occurrence.
- He is often uncertain about the identities of the culprits unless he knows them.
- He intermingles the actions of various individuals in the occurrence.
- He is biased in favour of the victim or of the culprit.
- He may be mentally imbalanced. He may exaggerate, using his fertile imagination.
- He may forget, rationalise, or get confused, as his evidence is often recorded after a considerable lapse of time.
- He is subconsciously influenced, by the opinions of other persons with whom he has discussed the case or who have aired their opinions in the media.
- His powers of observation, memory and description may be minimal. He may make up for the shortcoming by perjury make a mess of the crucial evidence.
- He may fear reprisals.
- He may be overawed by the courtroom environment and forget the observations.
- He is bullied by a bulldog of a counsel.
- The culprits may have threatened/scared the witness.
- The opposite party (defence) may have bribed/bought him.

In view of the above, it is highly dangerous and improper to accept the eyewitness accounts as kingpin evidence in its totality or in all cases. Both observations in actual cases and in experiments/research have brought out its fallibility vividly.

Further, urbanisation and individualism have made the availability of eyewitnesses scarce. Fear of retaliation and consumption of time keep the possible eyewitnesses away from his social/moral duty to help maintenance of law and order.

The other non-scientific sources of evidence (confessions, approvers, stock witnesses), as already seen[3] have also failed to deliver real justice.

3.2.2 Scientific Alternative

The scientific tools and techniques of Forensic science, in its varied forms is the only hope to meet the old and the new challenges of crime and classical and new scientific criminals. Forensic analytics has crossed all physical barriers.

3. Chapter 1.

Forensic Science has the capacity to provide needed help. It can do so if the IO knows how the evidentiary clues are correctly located, collected, packed, dispatched, handled and processed, in accordance with the law of the land, so that the court including the defence cannot pick holes in the evidence. He must also know the possibilities and limitations of the given piece of evidence. The scientist has to be academically sound, professionally trained and experienced and above all dedicated to the work. He must not be overloaded with work. He should have the proper equipment and other paraphernalia including supporting staff. Likewise, the counsels and the judges must know the potentialities, limitations, and developments of the science.

3.3 PROBLEMS OF PROOF IN TRIALS

Forensic science can provide flawless proof to link the criminal with the crime beyond reasonable doubt in most of the cases, if its base materials (clues) are properly handled.

The problems of proof are divided into three main categories:

1. Investigative problems
2. Scientific problems
3. Legal problems

3.3.1 Investigative Problems

Scientific evidence can link the criminal with the crime through clue materials. The criminal at the crime scene leaves clue materials at the crime scene, on the victim or on the various articles at the crime scene; or, he picks clue materials from them. If the clue materials are properly collected, preserved, dispatched, got evaluated and their identity, integrity and authenticity remain unquestionable, they can be strong evidence for the proof against the culprit. For example, a fingerprint is found at the crime scene. The suspect has no legal access to the scene. The involvement of the suspect in the crime becomes certain if this fingerprint is identified to be that of the suspect.

This clue material (fingerprint) has to be collected. The collector has to have proper training and expertise, adequate experience for its collection and preservation. If the investigator does not possess adequate knowledge and experience and latest tools, he will not be able to collect the clue materials correctly and the evidence is lost. Unfortunately, the present system of selection, training and to keep them updated in the expertise, is inadequate to meet his requirements.

The crime incidences in our country (as in most other countries) are rising. The increase in the number of investigating officers is not keeping pace with the increasing crime. Consequently, the investigator is not able to give adequate time for the investigation of a case: to locate, to collect, to preserve and get the clue materials evaluated properly. Consequently, valuable evidence is wasted. The distances involved to cover various crimes are also large. The time taken, the cost incurred and the labour inputs are often wasted because by the time the investigator reaches the crime scene, the scene had already been disturbed by the onlookers, curiosity hunters and by the members of the families involved in the incident. The investigator is also not sure of the scientific support or value of the scientific evidence in such circumstances. The uncertainty of the value of the evidence makes him wary to collect even the undisturbed evidence left at the scene that may still be worthwhile.

Theft, mutilation, or destruction of the evidence by culprits or by their sympathisers is not unknown. Sometimes the *corpus delicti* is missing even in the most heinous crimes such as murders and dacoities. The time lag in reaching the scene plays havoc! Authenticity/integrity/identity and relevance of evidentiary clues, collected from the sources, and proved beyond reasonable doubt. The site from which they are collected must be fixed through photographs and sketches.

They are collected in the presence of the witnesses; they are sealed after putting the identification marks on the evidentiary clues whenever possible at the scene. Two independent witnesses should authenticate the collection/packing/sealing of the evidence.

The sealing is done to prevent any substitution, mutilation, destruction, or contamination of the evidence. The evidentiary clues, which are liable to putrefy or disintegrate, are preserved so that the evidence is not destroyed before the experts examine it in the laboratory. If the authenticity of the evidence is not proved beyond reasonable doubt, the courts do not accept the evidence as genuine. It is often suspected to be "padded" evidence. Not only the value of the evidence to link the criminal with the crime is lost but it also casts aspersions on the investigator.

Padding, the induction of fake evidentiary clues, does not pay. Padding is highly unethical. A clever lawyer easily exposes it through clever cross-examination. Once it is exposed, it has an adverse effect on the total evidence in the case. It should never be attempted.

The investigators in general have little faith in the value of the scientific evidence. The following factors contribute towards the fiasco:

- Lack of knowledge
- Inadequate exposure to scientific methods
- Insufficient opportunity for professional dialogue with the scientists
- Improper collection and submission of evidentiary clues

Dialogue between the investigator and the forensic scientists can overcome the uncertainties and bring in better understanding of the value of scientific evidence. Forensic Science Laboratories have come up in most parts of the country. However, the staff strength, the equipment, and other facilities available in these laboratories are inadequate to meet the demands placed upon the scientists in most of these institutions. Besides, the workload is ever increasing. It results in delays and at times inadequate examination. These factors further discourage the Investigating Officer to utilise the evidence.

The general level of education and scientific knowledge is improving in the country. The criminal is increasingly depending upon science and technology to carry out his nefarious work. The investigator on the other hand is too busy in his routine and non-investigative duties. He hardly finds time to update his knowledge and is thus unable to meet the challenges adequately. He continues to depend upon the third-degree methods, which he finds efficacious in the initial stages. Confession from the accused bolsters his confidence. Later retraction of the confession in the trial courts puts the investigating officer in an embarrassing situation. At the stage, however it is too late to collect fresh evidence, which may help him in getting the culprit convicted.

In short investigative problems of proof call for:

- Re-orientation of the training programmes of the investigator.
- Equipping (Investigating Kit!) the investigator to collect and utilise scientific evidence.
- Instilling in him and making him realise the truth that the scientific evidence alone can link the crime and the criminal with certainty, unambiguously and unshakably.
- Frequent collaboration of the scientist with the IO.

Practical investigative problems to which the investigator must pay attention are:

3.3.2 The clue material is relevant

The clue is relevant if it belongs to the case and provides some information about the occurrence, the culprit, his *modus operandi*, victim and the sequence of occurrence, The help of witnesses who certify its collection augments the relevancy.

3.3.3 It is authentic

The clue is authentic if it is proved that it is the same clue, which was left/picked by the culprit, it is the same clue which was collected by the investigator; it is the same clue that was examined in the laboratory, it is the same clue, which is in the court, about which the evidence is being presented. Witnesses of the collection and intact seals (from the scene to the laboratory and to the court) ensure its authenticity.

3.3.4 Its integrity is beyond doubt

The integrity of the clue is beyond doubts; if it is proved that it has not been

- Substituted,
- Contaminated,
- Changed due to natural change or otherwise,
- Mutilated.

It is preserved: no putrefaction, no disintegration, no evaporation, no seepage, and no leakage! The name of the preservative, if used, should always be mentioned.

3.3.5 Its chain of possession is intact

A "Custody" log maintains the chain of possession of the clue material. Its movement/location should be recorded from the time it is taken into possession to the time it is produced in the court. The persons involved, the date and the time should be recorded.

3.3.6 Scientific Problems

The use of science in the dissemination of justice is comparatively new to India. There are many hurdles in its proper utilisation. Some of the important ones are discussed here.

3.3.6.1 Perfect Science

The nonprofessional considers science as something exact and definite. He, therefore, feels that forensic science should always provide a definite answer whenever the question is put to the forensic scientist. The concept of an exact science is hazy among the non-scientists, even among the educated persons, which include lawyers and judges. There is no such thing as an exact science or perfect science. Every new scientific entity starts with an idea. It leads to a hypothesis. If this hypothesis explains and holds good for a number of related phenomena connected to that hypothesis, the hypothesis is called a theory. If there are no apparent contradictions, at least serious contradictions, in the experimental and theoretical results, the idea (hypothesis and theory) receives general acceptance. This general acceptance is reached after a lot of experimental and theoretical work. Before the general acceptance stage, there is a twilight time zone where the idea receives a thorough appraisal and explanations for apparent contradictions. Once the general acceptance stage is reached, the scientific idea is considered a law. However, this law may also be imperfect as its effects and experiments may have been interpreted wrongly. Those who have studied even elementary science must be familiar with the law of conservation of

matter. It was stated that matter could neither be created nor destroyed. The law was held good for a long time and was not only accepted as the perfect law but was proved, time and again, by experiments in the laboratories. However, this law stands shattered when Einstein indicated that matter and energy are inter-convertible. Later on, the inter-convertibility was proved by scientists experimentally. Atom bomb and atomic energy are its dazzling manifestations.

In Forensic Science, also the concept of exact or perfect science is on the same footing as in other sciences.

3.3.6.2 Substantive or Weak Science

There is a general belief that scientific evidence is weak evidence. It is not so. In fact, scientific evidence is real substantive evidence, better than the evidence of the eyewitnesses; because—

- It is objective evidence.
- It is verifiable.
- It is unbiased.
- It is demonstrable.

The misconception that scientific evidence is weak evidence has cropped in because of the improper handling of the scientific evidence in the earlier stages of its induction. Besides, the so-called experts who produced the evidence in the early era were often not qualified experts. Most of them, especially handwriting experts, were only self-proclaimed experts. They did have some qualities: gift of the gab, the presence of mind and the infinite capacity to tell lies and a knack to entice their clients, which kept them in the profession.

The real problem, which causes confusion in the minds of the non-scientists, is the scientific basis on which identifications in forensic science are based, namely; the Law of Probability.

The law determines the chances of occurrence in a particular way out of a number of ways in which an event can occur with equal facility. All identifications, definite or indefinite, even non-identifications, are based on this law of probability. It is a mathematical concept. If the probability is very high, the occurrence of the events in a different way is ruled out for all practical purposes. However, the possibility of non-occurrence cannot be completely ruled out mathematically. For example, the identification of a questioned fingerprint *vis-à-vis* a specimen is based upon finding of numerous common characteristics in the two fingerprints. There may be ten ridge endings, ten ridges bifurcations, six short ridges, two islands and two deltas common in the two prints. If we presume the frequency of occurrence in one person out of ten persons for ridge endings, bifurcations and short ridges and one out of hundred persons for islands and deltas, then the probability of second occurrence of the patterns will be:

$$\mathbf{1/10^{30}}$$

It, in other words, means the chance of occurrence of similar fingerprint in the population is less than one in $\mathbf{10^{30}}$. The chances are infinitesimal that for all practical purposes, it can be taken that the chance of occurrence of a similar pattern in another fingerprint does not exist. The forensic scientists generally believe that if the chances of second occurrence of the event are less than $1/10^{10}$, the occurrence does not take place. They take that **Practical Identity has been achieved**.

Now non-scientists do not understand this concept of practical identity. They feel that the scientist has not given a definite opinion. It is a probable opinion. Forensic science, therefore, is not an exact science.

The confusion perhaps is caused by the fact that non-scientists equate the "**mathematical probability**" to that of "**probability**" used in ordinary parlance, where the word means something probable, but not certain. This concept perhaps led a High Court Judge to ridicule an expert who had based his opinion on probability[4].

3.3.6.3 Presentation of Evidence

Forensic expert evidence is technical in nature. Its improper presentation has hindered its acceptance. The main deficiencies are given without data, without illustrations, without giving its strong/weak points. Some experts side-track even the asked explanations. They do not compile/record the empirical data on which they have based their findings. They use bombastic words and unintelligible theories and jargons to impress the court. Such presentations ensure Waterloo for the evidence. The presentation mode must change. The expert should:

1. Use simple nonprofessional's language. He must avoid bombastic words/jargons/ complicated theories.
2. Use illustrations/graphics/photographs/charts to make the evidence intelligible.
3. Take time to consider/explain the point raised in questions. Instant experts make mistakes/blunders.
4. Be polite.
5. Remain un-rattled on cross-examiner's attempt to rattle him.

Some experienced experts do not record, though they do assess the data, based on their experience. Most of the courts do not appreciate the absence of data. The identifying data make the evidence more respectable/impressive. It helps the courts to appreciate/appraise the evidence better. Besides, it is professionally more satisfying mode.

3.3.6.4 Quality Control

There is no quality control mechanism in generating and presenting forensic evidence, in India, today. It should be part of the system. Regular blind tests at irregular intervals should be the basic rule. Checks for honesty should be part of the system. If there are complaints of dishonesty, covert investigations should ascertain the factum. Quality assurance panel should also check periodically the equipment, the techniques and the data generated by the expert for giving both positive and negative reports.

Quality control involves the following elements:

3.3.6.5 Standardisation

Standardisation of tools and techniques is essential in all scientific work so that the results given by one institution do not differ from the finding of another institution. If tools and techniques are standardised, it should be possible to achieve a sort of uniformity in the scientific examination of clue materials in forensic science. Absolute standardization, however, is not possible for many reasons. *Firstly*, the clue material can be analysed by different tools and techniques. The scientists differ in their selection of tools and techniques. *Secondly*, the advent of new tools and techniques is so fast that their induction in different institutions simultaneously is not administratively feasible or perhaps desirable. Further, rigid standardisation will hamper the introduction of new tools and techniques, innovations and research. Therefore, it should

4. *Bhulakiram Koiri v State of West Bengal,* 1970 Cr LJ 403, 73.

be introduced only in general terms leaving open the scope for continuous developments, innovations and research.

3.3.6.6 Accreditation

Accreditation of the experts and of the institutions is essential to control the menace of dishonest and unqualified experts. It has to be done of course by an authorized body of qualified forensic scientists at the central government level.

3.3.6.7 Miscellaneous

Minor problems relating to scientific proof, include the following: —

- **Are the tools and techniques being used adequate and up to date to generate the data required?**

  There is an unfortunate tendency among the scientists to continue using the same tools and techniques that they adopted in their training, years ago. Newer tools and techniques are often sensitive, specific, and more efficient.

- **Has the expert used modern technology?**

  If not, he should be made to do so.

- **Has the expert followed the standards laid collected/used the requisite data for his report?**

  He should be asked to do so if such standards exist.

- **Are the inferences/conclusions based upon adequate empirical/statistical data?**

  All identifications, as already seen, are based upon extensive statistical data. If it is not broad based it can lead to miscarriage of justice. It is, therefore, essential that the statistical base is checked. In UK, extensive statistical data has been generated for glass, paint and DNA, Similar data has to be generated in our country, if the identifications of the common source are to be reliable.

- **Are photographs or illustrations necessary?**

  Photographs or Illustrations do not help the expert to form an opinion in most of the cases except in UV/IR/X-rays, photography. The expert depends upon the instruments. The illustrations and the photographs, however, facilitate the understanding and presentation of the evidence. The report is based upon data from instrumental observations. Besides, if the expert is dishonest, he can manipulate the evidential illustrations, without the court being aware of the manipulations, nor the court is in a position to check the fraud. If the expert evidence is suspect, the only correct course is to get a second or even third opinion from reputed honest and experienced expert(s).

- **Can judges act as super experts?**

  If so, they have to form an opinion on the evidence of the experts. It is unfortunately absurd. The judge is not an expert on experts. He cannot act as a super expert. If he is not satisfied with the findings of an expert, he should requisition the services of another qualified/experienced/honest/efficient expert.

- **Private experts are a real big problem.**

  They are available for all branches of Forensic Science. Most of them can furnish any report or statement tailored to suit the requirement of the client. The judges

often get puzzled when two experts from the two sides give diametrically opposite reports. They often ignore both or utilise one, which is in line with the other evidence. This often leads to a miscarriage of justice. The judges can, of course, judge the expert whether he is truthful or telling a lie, if they find time and observe his demeanour during his deposition and cross-examination.

3.3.7 Legal Hurdles

The legal problems relating to proof in Forensic evidence involve enacted law, case law and certain court conventions. They have been discussed under the topic Relevant Law/case Law (*infra*). Some practical problems are:

3.3.8 The number of matching points

The number of matching points required for the identification of fingerprints was controversial. The Supreme Court has decided the issue that the rarity of the matching points is important rather than their number, to provide identity[5].

> *Now the question remains as to how many points of similarities can definitely establish the identity beyond question. The Federal Bureau of Investigation of USA requires twelve and the Scotland yards requires sixteen points of similarities for positive identification. However, some English and American authorities are of the view that if there are five or six "well-grouped" characteristics and the patterns uncommon, the identification is definite. By well-grouped characteristics, they mean dots, islands, hooks and spurs. If five or six characteristics occur close to one another and in a narrow area, the force of identity is enhanced. In the case of blurred or partial impressions, the view of some of the Indian authors is that if there are three identical points, they would be sufficient to prove the identity. This has been questioned by other Indian authors who insist on at least six points of similarities to establish the identity. The Finger Prints Bureau of different States in India have fixed varying standards, requiring six to twelve points of similarities to determine the identity. In para 88 of the Finger Print Manual of M.P. State it has been observed: "If a sufficient number of ridge characteristics are in complete agreement in the two impressions it can be said definitely that the impressions were made by the same person. However, no definite rule can be laid down for fixing the number of points of similarities. Four or five might be sufficient if there were unusual peculiarities. The consensus of modern opinion is that six, four in sequence, are sufficient to justify the definite opinion being given.*

3.3.9 Rudimentary Science

The track evidence is believed to be "rudimentary Science" by the courts. They do not place "much reliance" on the evidence. This is most unfortunate. The identification of foot and footwear marks is as reliable as any other identification, though, because of the mechanics of registration of crime evidence it may not provide adequate identification data, as frequently. However, it does not make it rudimentary science in any way. The judgment of a Madhya Pradesh High Court judge is noteworthy in this regard[6].

> *We examined and compared the footprints for ourselves. In our opinion, there is such a remarkable similarity between the admitted footprints of the accused-appellant, Surajpal Singh and the footprints in blood found on the spot that there is a high degree of probability that the footprints in blood found on the floor of the verandah of the accused-appellant, Surajpal Singh are the footprints of the accused-appellant Surajpal Singh.*
>
> *It was, however, unfortunate that it (the development in the identification of track marks) was not brought to the notice of the court that the identification of persons from footprints has*

5. *State of Madhya Pradesh v Sitaram Rajput,* 1978 Cr LJ 1220 (SC).
6. *Surajpalsingh v State of Madhya Pradesh,* 1972 Cr LJ 1668.

many facets and all these facets could not be clubbed together and science of identification from footprints be dubbed as a rudimentary science.

3.3.10 Identification of Handwriting

Identification of handwriting has always required high expertise, vast experience and heavy inputs to come to correct conclusions. Yet the laity feels/believes that if they can identify the handwriting of their kith and kin (which they do day in and day out), they can also identify the handwriting of other persons. When they try, they make mistakes. They blame the science of handwriting identification for its fickle nature. The dissenting opposing experts aggravate the problem further. The courts are wary of accepting handwriting identification evidence. It is unfortunate. They must use the expertise with the help of a reliable expert.

Miscarriages of justice, in handwriting cases occur frequently as in most of the cases judge pass on the onus of judging the evidence to the loudmouth. The courts have to discriminate the charlatans from the genuine expert. Simultaneously, they should change their attitude toward the expertise. It is as good or bad as expertise in other disciplines. The point is brought out vividly in one of the Apex court judgments[7]:

.....But the hazard in accepting the opinion of any expert, handwriting expert or any other kind of expert, is not because experts in general, are unreliable witnesses – the quality of credibility or incredibility being one which an expert shares with all other witnesses, but because all human judgment is fallible and an expert may go wrong because of some defect of observation, some error of premises or honest mistake of conclusion. The more developed and the more perfect a science the less the chance of an incorrect opinion and the converse if the science is less developed and imperfect. The science of identification of fingerprints has attained near perfection and the risk of an incorrect opinion is practically non-existent. On the other hand, the science of identification of handwriting is not nearly so perfect and the risk is, therefore, higher. An expert deposes and not decides. His duty is to furnish the judge with the necessary scientific criteria for testing the accuracy of his conclusion, so as to enable the judge to form his own independent judgment by the application of these criteria to the facts proved in evidence".

We are firmly of the opinion that there is no rule of law, nor any rule of prudence, which has crystallised into a rule of law, that opinion evidence of a handwriting expert must never be acted upon, unless substantially corroborated. But, having due regard to the imperfect nature of the science of identification of handwriting, the approach, as we indicated earlier, should be one of caution. Reasons for the opinion must be carefully probed and examined. All other relevant evidence must be considered. In appropriate cases, corroboration may be sought. In cases where the reasons for the opinion are convincing and there is no reliable evidence throwing a doubt, the uncorroborated testimony of an handwriting expert may be accepted. There cannot be any inflexible rule on a matter which, in the ultimate analysis, is no more than a question of testimonial weight.....

3.4 EXPERT TESTIMONY

Section 45 of the Indian Evidence Act, 1872 and section 293 of the Criminal Procedure Code, 1973 mainly cover the expert evidence. The expert visits the crime scene and help the IO to locate/collect/preserve the evidentiary clues. He examines the clues in his laboratory. He performs the required experiments, makes observations, collects/record the relevant data and draws certain conclusions based on the collected data. He prepares a draft report. He discusses it with his colleagues, removes the lacunae/deficiencies, and prepares a final self-speaking report. It is concise, precise and comprehensive with reasons/photographs/charts, It is intelligible and convincing.

7. *Murarilal v State of Madhya Pradesh,* AIR 1980 SC 531 : (1980) 1 SCC 704 : 1980 Cr LJ 396.

He submits the report to the court through the requisitioning agency. Sometimes the findings are presented in the court personally orally with/without a written report. The written reports of certain specified experts are being accepted as evidence without personal attendance under section 293 of the Criminal Procedure Code, 1973. The list of government officers includes the director, the additional, joint, deputy and the assistant directors of a forensic science laboratory in addition to other government officers[8]. The courts can and do order the personal attendance of the experts when they find it essential.

It has been seen that oral testimony of the eyewitnesses is highly unreliable. Can we depend upon the expert evidence of the scientist? The experts can also be incompetent, corrupt, ill and subject to human errors? Consider the following situations:

1. *A fired cartridge case and the suspected firearm were sent to an "expert". The test cartridge fired by the expert developed high pressure. Consequently, its percussion cap bulged out and got imprinted with a number of marks. The anvil caused a protrusion in the firing pin impression. The "expert" declared non-identity of the common source of the test and crime cartridge.*

   A second expert linked the "crime" cartridge to the suspected firearm! (CH)

2. *A fingerprint expert was once required to give opinion on a disputed fingerprint in the court itself. He used a magnifying lens to study and compare the print with another print. He found ridge patterns and identification characteristics alike. But he was not satisfied with the findings. He requested the court for time to carry out a more detailed examination of the prints under a microscope.*

   The examination revealed the drawn nature of a forged print. (CH)

3. *Once an experienced firearm expert matched the common source of origin of a test and crime bullets (which he had examined under a microscope and taken photographs). When he scrutinised the same in the court at the time of evidence, he was shocked that he had compared and photographed only the test bullets inter se. The expert at once admitted his mistake. He took the crime/test bullets to his laboratory and found that the crime bullet had not been fired from the firearm! (CH)*

4. *Another expert, after a long tiresome journey was immediately taken to the witness box. He identified the source of footwear impression from a particular shoe positively. When his report was shown to him, it indicated only a probability of the impression being from the suspected shoe and not a positive identity! (CH)*

   In some world-famous cases serious mistakes were made:

- *Hitler's handwriting and signatures, in his alleged diaries, were wrongly attributed to him by about half a dozen experts.*
- *Mussolini's fake diaries hoodwinked many handwriting experts.*
- *Dreyfus, a French army officer, was wrongly convicted on the opinion of a self-styled handwriting expert. The miscarriage of justice came to light only years later when the real culprit confessed to the crime.*

Thus, it appears that perhaps expert evidence is unreliable. But it is not so:

- *First*, the subjective factor in expert evidence is very little.
- *Secondly*, it is always verifiable.

If the menace of the corrupt expert is eliminated, the expert testimony can go a long way to assist the dissemination of real justice.

The experts must use the concept of practical identity and familiarise the court and the counsels about the concept. No two entities are exactly alike. There are always some differences.

8. See *The Criminal Procedure Code,* section 293 in the chapter "Relevant Law".

All identifications, therefore, are based on probability. Counsels point out the differences only and plead that the identity is not established. The expert admits the existence of the differences, but he also indicates the preponderance of similarities that establishes practical identity of the common source.

In the presentation of evidence in a court, the prosecution counsel assists the expert. The defence counsel critically appraises him and his evidence. The court makes the final assessment of the evidence. There is no material difference in these aspects even when the expert is produced as a prosecution/defence/court witness.

Corroboration of expert evidence is not legally required as clearly enunciated by the Supreme Court[9]:

> *We are firmly of the opinion that there is no rule of law, nor any rule of prudence, which has crystallised into a rule of law, that opinion evidence of a handwriting expert must never be acted upon, unless substantially corroborated.*

In practice, most of the courts are hesitant to base their convictions, solely on expert testimony, as a matter of abundant caution. However, there are reported cases where the courts convicted the culprit on expert evidence alone. There is no hard and fast rule in this regard. The circumstances of each case determine the weightage to be assigned to the expert evidence.

3.5 THE EXPERT

The chief performer in the presentation of the expert evidence is the expert. He must see that:

1. He is thorough in his examination, has prepared the notes and the illustrations properly, consulted literature and discussed the evidence with his subordinates, colleagues and superiors.
2. He does not allow his imagination to go beyond the realm of observed facts. He does not bluff, does not lose temper, does not hasten with his opinion on incomplete data, and does not have a bias or dishonest intention.
3. He does not propound and maintain complicated and unintelligible theories dogmatically, by using high-sounding words and jargons.
4. He takes sufficient time to consider all the factors and utilises the available sources of information to solve the problem put to him.
5. He has considered the contradictory evidence.
6. His conclusions are clear, unambiguous, definite, and brief. He knows their degree of accuracy or probability.
7. He is conversant with the latest developments in the field.
8. His language is that of a nonprofessional. If technical terms have to be used, they are kept to the minimum and they are fully explained, if necessary, with diagrams, sketches and photographs. If the expert cannot bring the technical evidence to the level of the educated nonprofessional, he is not doing his function properly. The professional experts engaged in forensic science laboratories, fingerprint bureau and handwriting identifications frequently appear in courts. If they are unable to express their findings in ordinary language, they are either incompetent or corrupt. They should be handled accordingly.

9. *Murarilal v State of Madhya Pradesh,* AIR 1980 SC 531 : (1980) 1 SCC 704 : 1980 Cr LJ 396.

I AM FORENSIC EXPERT

1. Academically, I am M Sc (Hons)/Ph. D. in Chemistry.
2. I had training, in Forensics, in UK (New Scotland Yard/other Home Office Laboratories).
3. I handled thousands of crime cases involving use of Forensic Science, over the past few decades and furnished evidence in the courts.
4. I have written about a hundred papers in Forensic Science, published both in India and abroad.
5. I have written over half a dozen books on Forensics, including the present one (VI Ed.).
6. I taught Forensics to one and all: Forensic science students/medico-legal experts/ judges/lawyers/ investigators, bankers and others.
7. I was Honorary Visiting Professor to Panjab University and taught Forensic Science (for decades) as a secondary assignment.
8. I participated in the examinations/reconstructions of many a case involving Forensics.
9. I participated/participate in forensics conferences/meetings/ seminars/workshops.
10. I framed Forensic science academic courses for universities/other teaching Institutions.
11. I was president of Indian Academy of Forensic Science, Kolkata for a few years.
12. I have devoted my whole life (decades), after academic education, to promote forensics.

An expert appearing in the court is "qualified" to start with. The following elements constitute the qualification of the expert:

1. Basic educational qualifications
2. Training; the institute from where the training was obtained, the course contents and the length of the course can give a fair idea of the training.
3. Experience, both in his own field and in the related fields, the number of cases examined both jointly and independently are brought on the record
4. Research work; the papers published and read in the seminars, conferences and meetings are brought on record.
5. Authorship, if the expert has authored books their names and subject matter should be brought on record.
6. Teaching and training programs, if any, conducted by him. They add to the qualifications.

All the above facts are brought on record to show that by education, training and experience the person is specially qualified to express an expert opinion on the subject. The position the expert holds, the length of service, the above record, and the performance help to decide whether the person giving evidence is a qualified expert or not. It is possible to eliminate the imposters at this stage itself.

It must be mentioned that quantitative experience alone is not sufficient. If a person has handled hundreds or thousands of firearms, for a number of years, as a hunter, a gun collector,

a gun dealer or even a gun maker, the experience does not make him a firearm expert for the criminal investigation work. Likewise, a bank clerk does not become a document expert because he handles scores or even hundreds of cheques every day. If a man has some basic scientific knowledge and training in the speciality, he would definitely be a better expert even if he has handled only a few cases. If quantitative experience is added to the qualitative experience, it is prized. This is achieved in the professional forensic science laboratories, where the experts examine the cases relating to his expertise only. Here a high degree of the specialisation is achieved. The experts know the latest developments and contribute to uplift of the profession.

The greatest menace in the expert testimony is the corrupt expert. He, for cash or kind, gives tailor-made opinions! His practices are varied:

- He may tamper with the crime or test exhibits.
- He may suppress the main points of evidence and lays stress on the minor points.
- He may not carry out complete tests and examination.
- He may not produce test exhibits.
- He may not produce proper data, or he may even produce wrong illustrations or data.

It is often difficult for the lawyers and the judges to detect these frauds. However, the judges know the corrupt expert through lawyers. His evidence, therefore, should be accepted with caution. The evidence should rather be got appraised by another expert known to be honest.

The specialists from the universities and other institutes of higher learning are sometimes called to give evidence. They do not appear in the courts often and find it difficult to express themselves in layman's language. However, if they are asked to explain their findings, they do so logically and clarify any apparent deficiencies or ambiguities in clear terms.

3.6 FORENSIC REPORTS IN TRIALS

Hallmarks of a Good Report

1. **It is concise, precise yet comprehensive/intelligible/convincing.**
2. **It is in simple intelligible language. No jargons/unexplained Technical terms/ formulae/ambiguous theories**
3. **It has preponderance of supporting data for its conclusions.**
4. **It explains the contradictory/non-supporting evidence (data).**
5. **It has quality illustrations to support the report.**
6. **It is well reasoned and permits only the given interpretation.**
7. **It is self-contained, self-explanatory, self-testifying.**

3.6.1 Contents of Report

An expert issues report on a standard format (form). The form contains information:

1. The laboratory case number
2. The report number with date
3. The case references (the FIR No. and the Letter No. with dates)

4. The date and mode of the receipt
5. The description of the packages/parcels (with their contents): their number, identification marks on them, seals and the signatures and whether the seals were intact or not and whether the seals tallied with the specimen seal(s).
6. The description of the exhibits, identification marks, signatures or the initials, on them.
7. The Rajasthan High Court[10] has condemned negligence in this regard:

   Another point that has been urged is that though it is proved that these articles were recovered from the possession of the accused, and they are the articles, which are before the court. There is no proof that these were those very particular articles, which were sent to the chemical examiner for examination.
8. The Questionnaire (in brief).
9. The dates on which the examination is commenced and completed
10. The number and nature of the test exhibits prepared.
11. The experiments carried out, the observations made, and the conclusions drawn.
12. The name of the examiner, his qualifications, and his designation.
13. The mode of the dispatch of the report and the exhibits.

The information given in the report has necessarily to be concise but sufficient to be intelligible and to prove the conclusions arrived at convincingly. The expert reports are used/perused by non-experts professionals, usually in the absence of the experts, under section 293 of the Code of Criminal Procedure, 1973, they are, therefore expressed in simple layman's language.

The seasoned experts usually standardise the text of the inference/summary/conclusion of the report. The standardisation increases clarity and obviates chances of misinterpretation. Besides, its frequent use prevents the grammatical mistakes, which are sometimes pointed out in the court, to the great embarrassment of the expert. The conclusion (inference) is highlighted.

The reports should have experimental data, photographs, illustrations, and sketches whenever possible and necessary.

The Gujarat High Court[11] has pointed out:

> *It is difficult to see how any reliance can be placed on the opinion unless it is supported by good reasons founded on the facts, which warrant that opinion. If the reasons are good and convincing and the factual data, on the basis of which the opinion is formed, warrant the opinion, the court will rely on the opinion. However, if the factual data is not clear or adequate or the reasons are frivolous or inconclusive, the opinion will have no probative value. That is the reason why section 51 of the Indian Evidence Act provides that whenever the opinion of any living person is relevant the grounds on which such opinion is based are also relevant.*

10. *State of Rajasthan v Motia,* AIR 1955 Raj 821 : 1955 Cr LJ 835.
11. *Suleman Usnam Menon v State of Gujarat,* (1961) 2 Cr LJ 78.

REPORT GALORE

On LLR (log Likelihood Ratio) odds are calculated in 9 stage:

1. **= Common source: definite positive report**
2. **= Highly probable common source: Highly probable positive report**
3. **= Probable common source: probable positive report**
4. **= Possible common source: Possible positive repot**
5. **= Insufficient common data: No conclusions**
6. **= some different characteristics: Possible negative report.**
7. **= many differing characteristics: Probable negative report**
8. **= Too many differing characteristics: Very probable negative report**
9. **= High preponderance of differing characteristics: definite negative report**

Note: - **Log Likelihood Ratio** (LLR) is a statistical comparison of two entities.

In Forensics the two entities are the supporting and the non-supporting characteristics.

In ordinary classification, the reports/conclusions are classified as under:

- Definite positive or definite negative conclusion,
- Probable (indefinite) positive or probable (indefinite) negative conclusion, or
- No conclusions

The conclusions of the report form the most important part of the reports. A definite report is given only when sufficient evidence is discovered for the linkage or de-linkage. At present, an inconclusive report is given no importance. A decision of Calcutta High Court[12] is relevant on the point:

> *Upon an analysis of the said evidence, we agree with the defence counsel. It is passing strange that an expert in his ultimate opinion would depend upon probabilities and not on the firm conviction. In the absence whereof the said evidence becomes dangerously thin indeed and the court of law would not take that by itself into consideration for fixing the guilt of the accused. The expert having reached the point of interrogation or of probability cannot be relied upon for conviction in a case under section 302 IPC.*

The weightage to be given to a probable on indefinite report varies from one report to another. One report may be inconclusive only technically. In the other, the evidence may be perfunctory, and the data may hardly cross the realm of possibility. Between the two extremes, the probabilities vary. It is the duty of the court to ascertain the value of an inconclusive report. As all identifications, definite or indefinite, are based only on probability figures (estimated or calculated), the court, to exploit the full value of an expert's inconclusive report, should ascertain the probability figures from the expert and use it for corroboration or elimination.

The reports should be sent as soon as possible. The adage "justice delayed, justice denied" is literally true in some cases. All the examinations should be carried out expeditiously and the reports thereof issued promptly. Patna High Court[13] has deplored the delay:

12. *Bhulakiram Koiri v State,* 1970 Cr LJ 403 (Cal).
13. *State of Bihar v Hanuman Koeri,* 1971 Cr LJ 187.

This inordinate delay in the examination by the ballistic expert is to be deplored. It is unfortunate that in such serious cases, the expert does not attach sufficient importance for a speedy examination and a submission of his report.

3.6.2 Illustrations

The expert evidence is technical in nature. The observations are made on the basis of the data collected through instrumental and chemical analyses, The correct idea about these experiments cannot be given by textual description alone. These observations are, therefore, illustrated through photographs, illustrations, and charts for the convenience of the court and the counsels, whenever possible.

The photographs are not necessary for the expert to come to a conclusion in most of the cases. His main forte is data obtained from the comprehensive study of the available/generated data, photographs and other graphics, comparison with standard data and the standards and appraisal of conflicted data. However, to a layperson, the evidence can only be demonstrated through illustrations and photographs. They are presented and explained personally, otherwise, the photographs can mislead and can create confusion.

Andhra Pradesh High Court[14] rejected the evidence, which was not illustrated:

With regard to the pin strike and finer striations on the base of the cap of the cartridge, the opinion expressed is definite and conclusive. But unfortunately he has not produced the test cartridge for comparison purposes. The learned advocate on that account, has argued that the data be supplied or the enlarged photos be produced, so that the opinion of the expert may be verified by the court and the court ought not accept the opinion of the expert without satisfying itself of the correctness of the same.

Learned counsel (for defence) has contended that the record does not furnish the material which has helped the expert in coming to his conclusions in this case and the court has not the advantage of looking into those materials so that to hold that the expert was justified in the opinion he has given. I think the submission must be accepted as correct.

3.6.3 Language

The expert is expected to bring the technical evidence to the level of a nonprofessional. He uses simple and clear language. He avoids technical terms as far as possible, both in the report and in the statement before the court. If he uses technical terms, he explains them.

In a murder trial, it was essential to establish the direction and location of the wounds for the proper reconstruction of the occurrence. The doctor who had carried out the post-mortem examination was not available. The post-mortem report was carefully studied, but it was in such technical jargons that nothing could be made out. A senior medical officer called, too failed to explain the same. (CH)

The Nagpur High Court[15] deprecated Technical verbosity:

I do not minimise the value of expert evidence but I deprecate the attempt to cloud a simple issue in a deluge of scientific words which no ordinary man would be able to understand. The law is grounded on, the assumption that the issues are ones which 'twelve good men and true' can comprehend and answer.

Three types of expert witnesses use technical terminology.

First, the shallow type; they want to impress the court with bombastic words, unintelligible theories, laws and formulas. They feel they impress the court by their use. In addition, they

14. Re *Thimma Reddy v State of Andhra,* 1957 Cr LJ 109.
15. *Basant Rao Baji Rao v State,* 1950 Cr LJ 181 (Ngp).

believe that they succeed in hiding the weaknesses of the evidence and of the case being supported. The courts refuse to be hoodwinked by this technique.

Secondly, the learned types; they know their subject thoroughly, but they are engrossed in their researches and studies. They feel that everybody knows (or should know) what they are talking. This class of specialists does not frequently appear in courts and are, therefore, unaware of the court's requirements. The court and counsel should ask clarification and elucidation of the unintelligible words and phrases in their testimony. The expert will be glad to amplify, though they may feel difficult to express in nonprofessional language.

Third, the corrupt types; They deliberately try to misguide the court through technical words.

The expert should be concise, precise, methodical and his submissions intelligible. Brevity should not be achieved at the cost of clarity.

3.7 THE PROSECUTION COUNSEL

3.7.1 Role

The prosecution counsel role in the trial involving Forensics is to induct technical evidence through an expert. He can do so effectively only if he understands the expert evidence, knows its strong and weak points. He, therefore, holds conference(s) with the expert, to discuss the evidence being produced and its impact on other evidence in the case, prior to putting the expert in the witness box. The counsel helps the expert to present the evidence systematically/logically.

3.7.2 Establish the *bona fide* of the Expert

The presenting counsel (the prosecution counsel in criminal cases) should see that the expert is "qualified". His relevant qualifications: basic educational qualification, training, experience, participation in discussions in professional gatherings, publications, and authorship, if any, of the expert are brought on record. This is essential even if the expert is known to the court. If the expert is well known to the court, it is sufficient to record a summary of his qualifications, so that if at a later stage the case goes to a higher court in appeal, the appellate judge knows that the expert evidence has come from an authentic source[16].

The courts are often easily satisfied as to the *bona fides* of the government experts if they are of a certain status. Even in such cases the status of the expert, qualification, training and extent of experience in the speciality is brought on record as a routine. In case of private experts, one must establish their *bona fides*.

3.7.3 Understand the Evidence

The counsel must understand the evidence. A conference with the expert for this purpose prior to putting him in the witness box is ideal. This is necessary so in heinous cases where it is often essential to determine whether the particular death was a murder, a suicide, an accident or an act of self-defence. Prior understanding will not only avoid sudden surprises in the case for him, but he shall also be able to clarify, amplify and ascertain certain points in the evidence, which may prove useful to the cause of justice.

It is the counsel who is to co-relate and interconnect the expert evidence with other evidence and present to the court an integrated case. He can do so only if:

- He understands the expert evidence.

16. *State of Bihar v Hanuman Koeri,* 1971 Cr LJ 187 (Pat).

- He is able to show that there are no contradictions in the different types of evidence, *inter se.*
- He is able to prove that the various pieces of evidence support one another and lead collectively to one and only conclusion that the accused is guilty.

3.7.4 Induct Demonstrative Testimony Systematically

The counsel ensures that the expert produces the data on which his findings are based. He illustrates the findings by charts, graphs, sketches, diagrams, photographs, and physical reconstruction wherever needed/possible and whenever necessary. He quotes authorities whenever required. The report should be so worded that an intelligent nonprofessional can understand it.

3.7.5 Anticipates the Defence Line

If a case is studied thoroughly, the presenting counsel is able to anticipate the defence line. He should discuss the same with the expert and cover the points, likely to be raised by the defence counsel in the cross-examination. They should be covered in the examination-in-chief itself. He is able to forestall the defence and thus, blunts the edge of the drama, usually enacted by some of the defence counsels.

3.7.6 Handle Inconclusive Report Effectively

An inconclusive report can provide only corroboratory evidence to the linkage chain. If possible, the counsel should get the probative values of the inconclusive reports.

In certain cases, the reports are, as already mentioned, inconclusive only technically. The views of the expert based upon his experience are obtained in such cases. The replies are of great value if the expert has extensive experience in the field and has a reputation for honesty and efficiency.

The inconclusive report sometimes has immense eliminative value. The experts do not often know about these possibilities at the stage of examination. The counsel should know and exploit them intelligently.

3.7.7 Listen to the Cross-examination Attentively

The counsel carrying out the cross-examination may bring forth material, which needs further elucidation or clarifications. He may direct the cross-examination in such a way that creates certain anomalies. It is the duty of the prosecution counsel to take a note of the anomalies and set the record right through re-examination of the expert witness.

3.7.8 Re-examine the expert

Sometimes the cross-examination brings in ambiguities, contradiction and deficiencies in the depositions of the expert. The re-examination clarifies/rectifies those.

3.8 DEFENCE COUNSEL

3.8.1 Role

The defence counsel plays a dramatic role in the induction of the expert evidence. He takes over the expert after the examination-in-chief. An intelligent defence counsel is attentive throughout the examination-in-chief and tries to appraise the evidence produced. He compares the oral evidence

with the written report, a copy of which is supplied to him beforehand, and other relevant data produced by the expert. He plans the cross-examination on his assessment of the situation.

The seasoned counsel does not start cross-examination offhand. If the expert evidence is significant, he takes time to study the report and consult an expert to assist him in the cross-examination. If he feels it necessary after consultation with the expert, he may produce rebuttal evidence.

DEFENCE COUNSEL CHECKS

1. Is the "expert" qualified: education, training, experience, research, publications?
2. Is the "expert" honest: reputation: ill? Demeanour?
3. Is the "expert" an imposter, biased, over-enthusiastic, and/or negligent?
4. Has the "expert" used jargons/verbosity?
5. Has the expert side-tracked the real issues?
6. Is the "expert" conformational Syndrome addict?
7. Does the demeanour of the expert change while answering questions on crucial issues (bungling!)?
8. Has the "expert" co-related the court exhibits with those on which he based his report? How?
9. Is the expert's opinion based on accepted standards? Authorities?
10. Is the expert's evidence convincing? Non-convincing evidence is not acceptable to the court!
11. Has the "expert" distorted photographs and illustrations?
12. Has the "expert" hid the identifying/non-identifying characteristic with indicator lines on the illustrations?
13. Has the "expert" produced adequate data to support his thesis?
14. Has the "expert" shown preponderance of positive/negative evidence to come to corresponding correct conclusion?
15. Has the "expert" discussed/explained contradictory/contrary evidence?
16. Is the expert evidence too technical to permit appreciation? In such a case, he employs an expert to assist in cross-examination.
17. Has the expert hoodwinked the court or bungled? In such a case the defence counsel produces rebuttal evidence.

The defence counsel cross-examines the expert with thought and care. An offhand cross-examination often does more harm than good to the defence case. For proper cross-examination, it is necessary that the counsel:

Understands the evidence. —It is not necessary for him to have studied the subject in a college or a university. But he must acquire sufficient knowledge from the case studies and available standard works recognised and utilised by the courts as authorities. The choice of the right book(s) is, of course, important.

Anticipates the total expert evidence.—As the copy of the expert report is supplied to the defence counsel beforehand he knows what will be the main evidence of the expert. However, often additional evidence and elucidation are sought by the prosecution or by the court at the

time of oral presentation. The defence counsel should be able to anticipate and understand the additional evidence. Otherwise, he should take time to study additional evidence.

Plans his cross-examination carefully.—Ordinarily, the aim of cross-examination is to:

- discredit the *bona fide* of the expert,
- challenge the correctness of his findings, or to
- seek elucidation/additional information, which may clarify, confuse, or contradict other evidence.

The counsel can plan the cross-examination well if he knows the expert, the expertise, the evidence and the details of the case thoroughly.

An impostor in the garb of an expert or the quack expert is exposed by exploring carefully the academic qualifications, the training, the experience, the publications and the research, he or she has claimed. If the expert has claimed the membership or the fellowships of some learned societies, the questions should be directed to know the nature, function and the actual work done by the society and by the expert. For example, some of these personalities add to their names "MFSSI" or "FFSSI", which are supposed to be the membership or fellowship of a defunct society, in India. The impostor often claims degrees or diplomas of non-existing universities and institutes. It should be possible to expose the fraud.

Another class of pseudo-experts is emerging in India. These impostors attend classes organised for police officers, lawyers, and judges to appreciate the scientific evidence. After attending classes, they claim to have acquired the necessary expertise, which such courses do not even pretend to teach.

In addition to the general and the basic education, four variables determine the expertise:

1. The training,
2. The experience,
3. The research, and,
4. The publications

If the credentials of the expert are doubtful, they should be probed.

In **training**, the standing of the institution where the expert obtained his training is important. The detailed nature of the training, the syllabus and the work done during the training should be scrutinised. The length of the training period is important. Some of these impostors have claimed even a short visit (for an hour or two) to an institution as training. Such claims can be easily exposed and should be exposed.

In **experience**, both the qualitative and the quantitative aspects are important. The outstanding cases handled, and the expertise provided by the expert and appraised by the courts and the counsels may also be noted.

In **research**, the subject of research and the journal, with pages, in which the research material is published, are relevant. If possible, the original source (journal) and the reprints of the publication should be obtained and scrutinised.

It is futile to try to discredit a well-established, honest and an efficient expert. It is also criminal to accept an impostor as an expert.

The evaluation of evidence, to challenge the correctness of the findings of an expert, is a difficult and a delicate task. Most of the lawyers prefer to put up another expert for the purpose. It is done in the following ways:

- Special power of attorney is obtained for the defence expert to cross-examine the presenting expert.
- The defence expert is put up on the witness stand for rebuttal.
- A renowned expert is engaged to appraise the report.
- The appraisal report is used in the argument

The services of a reliable expert are not always available. Frequently the counsel has to carry out the cross-examination himself.

It must be remembered that the basic principles of forensic science are simple. Any educated person, who is willing to understand the subject, can do so without any difficulty. Of course, he must have standard books on the subject, the time for their perusal and the will to understand the subject. The study is always rewarding. The incident with Mr. Fallen, a famous American lawyer, may be recalled:

Mr. Fallen, the eminent lawyer, once carried out a brilliant cross-examination of the head of the Gynaecology Department of the Harvard University. At the end of the cross-examination, the professor asked Fallen "May I ask you a question"?

"Certainly", replied the lawyer.

"Where and when did you study Gynaecology, Mr. Fallen"?

"Last night in my library," replied the lawyer.

3.8.2 Defence Counsel's Checklist

The weak points of expert evidence are found from the following checklist:

3.8.3 Did the expert compare the crime exhibits with the test ones?

An expert testified that the crime bullets had been fired from the questioned firearm. The defence counsel knew that the firearm had not been used in the crime. He was, therefore, puzzled at the result. The counsel carefully examined the questioned bullet and the photomicrograph produced by the expert. The crime bullet was deformed to a certain extent, whereas there was no deformation visible on the photograph of the crime bullet. He put up his doubts to the expert. The expert gave a careful check and admitted the possibility of a mistake. He asked for more time, which was readily given.

The re-examination of the exhibits revealed that the expert had by mistake compared two test bullets inter se! (CH)

3.8.4 Does the expert identify the exhibits?

Ordinarily the expert puts his identification marks on the exhibits. The counsels should check the basis of the identification of the exhibits in doubtful cases, as sometimes the exhibits get lost or replaced.

A few years ago, a cartridge case was put up for the identification purposes to the expert in the court. It did not bear the usual initials and the other identifying scribble. The expert was puzzled. However, he had a photograph of the base. He compared the same with the cartridge base. The two did not tally! Later, it was found that the original crime cartridge had been lost and the person responsible for the custody presumably introduced the substitute! (CH)

3.8.5 Has the expert based his opinion on the accepted standards?

The expert should be asked to state the accepted standards of proof of practical identity in the comparison work. The same should be checked beforehand from some standard sources. If

any discrepancy between the two standards is noticed and if the standard of proof of the expert is substantially lower than that given by the authorities on the subject, it should be brought on record. The evidence provided by the expert should then be measured with the yardstick thus laid. In some cases, the evidence would be found below the accepted standards.

It is perhaps relevant to mention in this context that very old books on the subject should not be quoted, as they may be outdated.

3.8.6 Is the evidence produced by the expert convincing?

The illustrations, graphs, charts, photographs, and the data are produced to convince the court and the counsels, in general. If they are not clear and intelligible, they are useless. The point should be pressed by the defence counsel and brought on record. However, the counsel should be familiar with the type of evidence, so that he does not ask any ridiculous questions, thus, exposing his own ignorance. The counsel must convince himself of the correctness or otherwise of the evidence before he stops the cross-examination of the witness.

The defence counsel must have an honest "open mind" approach with the expert evidence. The "closed-door" approach (where the counsel rejects whatever the expert says) does not help. The courts are quick to detect the latter approach. The detection harms the defence case. The court becomes sympathetic towards the expert. The defence counsel earns a bad feeling of the court in the bargain.

3.8.7 Has the expert carried out adequate tests and experiments?

Ordinarily, the expert carries out all the essential spadework. In rare cases only, he may neglect the necessary experiments (due to carelessness, over-work, illness or due to bad intentions). It is often difficult to ascertain the same. A careful scrutiny of the evidence on the part of the defence counsel, with or without the help of an expert, however, may reveal the lacuna.

> ***"General scientific acceptance is a proper condition for taking judicial notice of scientific facts, but it is not a suitable criterion for the admissibility of scientific evidence. Any relevant conclusion supported by a qualified expert witness should be received unless there are distinct reasons for exclusion."***
>
> ***[Rule 702 of the Federal Rules of Evidence, USA]***

3.8.8 Are the exhibits authentic?

It is difficult to ascertain whether the exhibits were safe in the laboratory. However, the expert must certify that:

- He received the exhibits in the sealed conditions.
- The seals were intact and tallied with the specimens supplied separately.
- He opened or got the packets opened in his presence and that he put his identification marks then and there.
- The exhibits during the examination remained in the personal custody (lock and key) of the expert and nobody has or could tamper them.
- He sealed or got the exhibits sealed after the examination.
- The exhibits in the court are the same, which he examined in the laboratory, pertaining to the case in hand.

3.8.9 Is the expert biased?

It is a difficult question to ascertain if the expert is biased. It is generally believed that a government expert is biased in favour of the prosecution and a private expert is biased towards the party employing him. It need not be so. In fact, the circumstances are such that the expert looks biased. The prosecution or the private party puts up an expert in the court only after it has been ascertained that the expert opinion is in their favour. If the opinion is not favourable, the expert is not put up. It is only rarely that the opposite party comes to know about the results and calls the expert as their witness in such cases. The expert is also called now and then by the court, as a court witness.

In one criminal case, the author had given a report, which was neither favourable nor unfavourable to the prosecution. They did not produce the report in the court. At the time of appeal the defence came to know about the existence of the report. The defence insisted upon the production and got the report produced in the court after considerable delay. The Chief Justice who was hearing the appeal had a hearty laugh and remarked, "Much ado about nothing". (CH)

The expert evidence is verifiable. It leaves no room for bias. The question of bias, therefore, has little relevance. In case of doubt, a second expert can be called. It is believed that the two honest experts will agree, almost invariably, to the fundamentals and may differ very slightly in the minor details, if they differ at all.

3.8.10 Additional Details

It is often useful to get helpful additional details. They may contradict the medical evidence or the evidence of the eyewitnesses. Consequently, a doubt may be created in the minds of the court that give its benefit to the accused. Examples:

The investigator allegedly recovered, in a case of murder, a 12 bore shotgun cartridge, made by the Indian Ordnance Factory. It was fired from the suspect weapon of the accused. The defence counsel, at the time of cross-examination, showed to the expert a felt cushion wad that was recovered from the dead body of the victim. The wad never formed part of the cartridges manufactured by the factory. A different manufacturer had been using felt wads in his cartridges! (CH)

2. *In a multi-murder case, the evidence of an eyewitness was believed because he was also allegedly injured in the shooting. The medico-legal expert had X-rayed the injury and taken out foreign material from the injury. On the request of the defence when the exhibits were examined at the time of appeal, no projectile or its fragments were found in the extracted material, nor there was any shadow of a projectile in the X-ray film! (CH)*

CROSS-EXAMINER'S MANTRA

Be mild with the mild; shrewd with the crafty, confiding with the honest, merciful to the young, the frail and the fearful, rough to the ruffian and a thunderbolt to the liar. But never compromise your dignity. Focus fully so that virtue and truth triumphs.

Paul Brown: Harris, 1911

3.9 THE JUDGE

The judge is the ultimate authority to evaluate and utilise the expert evidence. The attitudes of the judges vary tremendously:

- Some judges under-rate expert evidence. They feel that it is weak evidence.

- Some judges are hostile towards the evidence. They feel that the expert assumes the functions of the court.
- Some judges fear expert evidence. They feel they cannot understand the evidence. They either ignore the evidence or accept the *ipse dixit* of the expert.
- Some judges believe that the evidence is not their worry. The counsels should understand and argue about it. The judge should decide the case on their arguments alone.

Such attitudes are undesirable.

The court's scrutiny of expert evidence is necessary:

- The evidence can turn the tables. A suspected criminal may prove to be an innocent person; or, *vice versa*.
- Most of the lawyers, on both sides, feel shy of the evidence. They may fail to properly present or critically appraise the evidence, which may lead to a miscarriage of justice.
- A clever lawyer may exploit the general lack of knowledge to twist the evidence to his advantage and misuse it.
- The prosecution counsel is interested in the prosecution case only. He will expose only those aspects of evidence, which are useful to the prosecution case and goes no farther.
- The defence counsel limits his probes to only those aspects, which are beneficial to the defence case. All his efforts would be to demolish the prosecution evidence.

Thus, only the judge is interested in real justice. He should, therefore, ascertain the facts, assimilate them and utilise them in the dissemination of justice. The newer generation of the judges is aware of their responsibilities in this regard. The expert evidence is likely to play more decisive role in the coming times.

The scientific methods in the detection of the crime are daily improving and are becoming accurate, sensitive, rapid and specific. However, at no stage they are unintelligible. They should be utilized. In brief, the judge must see that:

1. The expert, the prosecution and the defence have done their duties properly, if they have not, the court should intervene at the appropriate time.
2. The expert is honest, properly educated, trained and is engaged in professional work. The court should not permit an impostor to impose upon the court and perjure.
3. The expert does not use meaningless jargons, technical terminology or verbosity to hide the weak points in his evidence or to mislead the court to non-issues.
4. The expert is not forced to answer questions in "yes" or "no". The scientific evidence often needs elaboration. "Yes" or "No" answers, at times, cannot do justice to the truth.
5. The expert has not side-tracked the relevant questions put to him by the counsel or the court.
6. The counsels do not waste time in asking hypothetical questions.
7. The expert evidence produced is relevant, intelligible, properly demonstrated and explained.

8. The points left ambiguous or incomplete, either by the prosecution or by the defence, are clarified through court questions.
9. The inconclusive reports are probed to ascertain their probative values and they are given due weight accordingly. Some reports are inconclusive only technically. They must be given due weight.
10. The data conform to the standards laid down by the concerned professional body.
11. The expert has explained the apparent contradictions satisfactorily.

Judge & the Daubert's Rule (Expert Evidence Scrutiny/acceptability made easy) Judge is the door Keeper to admit only reliable/relevant evidence. He verifies that: The reasons/methodology are valid scientifically. The reasons/methodology are applicable in the case in hand. The theory/techniques used can/have been tested. The standards for the tools/techniques exist. The mechanism to lay/maintain standards exists. The standards maintain/control the processes. The principle/methodology has undergone peer review. The technology used, is generally accepted/used by others professionals in the field. The rate of error is known. The expert explains the improbability of the alternative version of the other party. There are no unjustified extrapolation of established principles/methodology used in the present case. [Daubert's Rule/ standard. 1993: *Daubert v Merrel Dow Pharmaceutical Inc*, 509 US 579 (SC)] (Author's Modified version)

3.10 FALLACIES ABOUT EXPERT EVIDENCE COURTS CONVENTIONS

There are certain court conventions including the following:

3.10.1 "A Court Must Form its Own Opinion"—

"The court must form its own opinion" is a time-honoured convention. It provides a useful check and prevents carelessness and complacency on the part of the expert and other witnesses. The court has to form an opinion on the total evidence including the expert evidence. Some persons feel that the judge must act as a super expert; an expert of experts. The convention does promote this thesis. If he has reservations about the evidence of an expert, a second expert or even a third expert is employed to clear the doubts.

The convention is irksome to some experts. They believe that the expert evidence is too technical to be understood by a nonprofessional (the judge, the lawyer). The belief has no basis. Experience of the author, literally in thousands of cases, indicates that it is always possible to bring the evidence to an understanding level of an educated man provided the man is willing to understand. Some judges and some lawyers, unfortunately, avoid doing so.

The convention ensures that the evidence is descriptive, demonstrative, in non-technical language, logical, intelligible and convincing. If the reports of the expert are considered "*sacrosanct*" and accepted without any scrutiny, the practice will promote miscarriage of justice.

Unfortunately, a few judges misconstrue the convention. They feel that they are expert on experts. They take up the role of the super expert and form their own opinions on technical issues. This is an incorrect approach. The essence of the convention is that the judge should not accept the *ipse dixit* of the expert. He must understand the evidence (with the help of another expert, if necessary) before using it along with the other evidence or rejecting it.

3.10.2 "The Expert must answer in "Yes" or "No""

Some defence counsels want the expert to answer all their questions in "yes" or "no" in the cross-examination. "Yes" or "no" answers, in expert evidence, can be given only at the cost of accuracy and clarity. They are likely to confuse the issues. The court must see that the expert is allowed proper opportunity to amplify and to clarify his testimony whenever he wants to do so.

3.10.3 "The Expert must answer all Questions"

This is also an unfortunate convention with some courts. The expert is a specialist in a very narrow field of his speciality and the knowledge is increasing at such a pace, that it is becoming extremely difficult to keep abreast even in one's own specialisation, what to talk of related fields. The expert is asked only relevant questions pertaining to his report/opinion that he has furnished. If the expert is asked relevant questions relating to the subject matter in hand, the expert must answer all the questions. However, if the counsel is allowed a free rein to indulge in witch-hunting, the expert is often pestered with hypothetical questions, which lead to confusion. Wigmore, an authority on evidence, has remarked:

Hypothetical questions are misused by the clumsy and abused by the clever.
They have in practice led to intolerable obstruction of truth.

3.10.4 "Expert Testimony is Weak Evidence"

Some persons consider expert testimony is subjective, an opinion of the expert. It is incorrect. An expert carries out experiments and makes observations. His conclusions are based upon the observations and they are verifiable. Therefore, the expert testimony is a report of facts. It is not subjective opinion evidence. The courts, which ignore the advances of science, show their own ignorance and the dispensation of real justice suffers. It is evidence of facts, based upon physical evidence. It is free from personal bias and emotions. Above all, it is verifiable.

3.10.5 "Expert Usurps Court's Functions"

An expert does not usurp the judge's functions! He informs the court on one aspect of the evidence only. There are other aspects, of which he may not even be aware. The court takes into consideration the total evidence. It does not decide the case on expert evidence alone in most of the cases. In this connection the words of Rogers, a famous authority on evidence, are worth noting:

> *The proper test of the admissibility of the expert is not whether or not the opinion of the expert would prove the very fact to be found by the jury (court). The object of all testimony is to prove the very fact to be found by the jury and it is not usurpation of powers of the jury to prove that fact.*

3.10.6 "Experts Differ"

The real honest experts do not differ on the basic findings. They may sometimes differ as to the quantum of weightage or to the adequacy of the data for proof. Diametrically opposite opinions are not possible from real and honest experts. One of the differing experts is certainly a corrupt person or at least incompetent.

3.11 TIME ELEMENT

Courts and counsels do not give due importance to the time element. Consequently, the justice delivery system suffers and quite a few cases end in acquittal.

Consider the following cases:

1. *A woman was stabbed at 1 pm. The doctor examined her at 1.45 pm and found the victim in an unconscious state. He found the blood was flowing from the wound "like water from a tap". The bleeding could not be stopped, and no blood transfusion could be given due to lack of facilities. The woman expired at 3 pm.*

   On post-mortem examination the doctor found that the arch of aorta *(the main trunk of the arterial system) was cut and some of the arteries were severed.*

   A dying declaration was allegedly recorded at 2.45 pm. It formed the only important piece of evidence.

   The dying declaration was contested by the defendant on the ground that the victim could not have regained consciousness at 2.45 pm as bleeding continued. Rather, she would have gone deeper into coma with the passage of time.

   The dying declaration could not be believed because of the time element of recording the confession. (CH)

2. *Some years ago, a housewife was taken ill. She was rushed to the hospital and given treatment. She responded to the treatment and was declared out of danger. After a night's rest, she again suffered from the fits and died. The doctor attending upon her declared that the cause of death was complications due to pregnancy.*

   Earlier, her mother had also died with similar symptoms and under similar suspicious circumstances. Some relatives, therefore, suspected foul play and informed the police. A post-mortem examination was carried out and viscera and other body materials were sent to the chemical examiner. The examiner found strychnine poison in the viscera.

   The chemical examiner's report was shown to the doctor who attended upon her. He opined that the poison must have been administered to the victim before she was admitted to the hospital, because after her admission in the hospital, only one nurse was allowed to attend upon her and no visitors were allowed. Before her admission in the hospital she could have taken the poison herself or she could have been given the poison by any of her visitors or relatives. It was, therefore, difficult to fix the identity of the culprit. As the victim had responded to treatment and had been declared out of danger, the investigating officer was not satisfied with the findings of the doctor. He took the medical chart to a toxicologist. The latter, on careful study of the medical chart, came to the conclusion that the victim could not have died of the poison administered to her before her admission to the hospital as probably she had eliminated most of the same and had responded to the treatment. He was certain that the poison was administered to her after she had been admitted to the hospital and declared out of danger.

   The time element fixed by the toxicologist also fixed the possible culprit. There was only one person – the attendant nurse – who was allowed to be with the victim. Prolonged interrogation of the nurse led to the real culprit. He had used the nurse as a tool. The culprit was convicted. (CH)

   In a multi-murder case, the defence alleged concoction and padding by the prosecution. They referred to photographs of the crime scene, which were allegedly taken by the police in the evening. However, the shadows of trees in the photographs indicated morning time. (CH)

It is important that all the investigating officers, the lawyers and the judges should take the time element into consideration to avoid sudden surprises in the cases. They should check and cross-check the presence of the accused, the witnesses, the physical phenomena, and the time of occurrence in a particular case.

3.12 CASE LAW

Supreme Court Cases

(21st Century)

3.12.1 "Rarest or Rare Case"[17]

Author's Summary

It is a landmark judgment in which the Apex Court discussed the Case Law on the subject and provides guidelines to identify the "Rarest of the Rare Cases" and also discussed the situations how to differentiate them from the borderline murder cases.

In this a husband-wife pair killed close relatives for pelf. The Trial Court sentenced them to death. High Court changed the sentence to life imprisonment. SC found the case to be Rarest of the rare cases and sentenced them to death.

Highlights italicised

Relevant Extracts (verbatim)

Having held that both A-1 and A-2 are guilty of the murder of deceased Relu Ram and his family and that their conviction under section 302 read with section 34 and section 120B and other provisions inflicted upon them by both the courts below does not call for any interference by this Court:

> *we now proceed to decide whether the instant case is one of rarest of rare cases warranting death sentence, as has been held by the trial court to be one, or the one in which sentence of life imprisonment would be appropriate, as has been held by the High Court while commuting the sentence of death to life imprisonment.*

Learned counsel appearing on behalf of the accused submitted that the present case cannot be said to be rarest of the rare one so as to justify the imposition of extreme penalty of death. This question has been examined by this Court many times without number. In the case of *Bachan Singh v State of Punjab,* (1980) 2 SCC 684 : AIR 1980 SC 898 : 1980 Cr LJ 636 before a Constitution Bench of this Court, validity of the provision for death penalty was challenged on the ground that the same was violative of Articles 19 and 21 of the Constitution and while repelling the contention, the Court laid down the scope of exercise of power to award death sentence and the meaning of the expression "rarest of the rare" so as to justify extreme penalty of death and considered that clauses (1) and (2) of Article 6 of the International Covenant on Civil and Political Rights to which India has acceded in 1979 do not abolish or prohibit the imposition of death penalty in all circumstances. All that they required is that, *firstly*, death penalty shall not be arbitrarily inflicted; *secondly*, it shall be imposed only for most serious crimes in accordance with a law, which shall not be an *ex post facto* legislation. The Penal Code prescribes death penalty as an alternative punishment only for heinous crimes, which are not more than seven in number. Section 354(3) of the Criminal Procedure Code, 1973 in keeping with the spirit of the International Covenant, has further restricted the area of death penalty. Now according to this changed legislative policy, which is patent on the face of section 354(3), the normal punishment for murder and six other capital offences under the Penal Code, is imprisonment for life (or imprisonment for a term of years) and death penalty is an exception. The present legislative policy discernible from section 235(2) read with section 354(3) is that in fixing the degree of punishment or making the choice of sentence for various offences, including one under section 302, Penal Code, the Court should not confine its consideration "principally" or merely to the circumstances connected with the particular crime, but also give due consideration to the circumstances of the criminal. In many cases, the extremely cruel or beastly manner of the commission of murder is itself a demonstrated index of the depraved character of the perpetrator. And it is only when the culpability assumes the proportion of

17. *Ram Singh v Sonia*, AIR 2007 SC 1218 : AIR 2007 SCW 1278 : 2007 Cr LJ 1642.

extreme depravity that "special reasons" can legitimately be said to exist. Judges should never be bloodthirsty. It is, therefore, imperative to voice the concern that courts, aided by the broad illustrative guidelines indicated, will discharge the onerous function with evermore scrupulous care and humane concern, directed along the highroad of legislative policy outlined in section 354(3), *viz.*, that for persons convicted of murder, life imprisonment is the rule and death sentence an exception.

In the case of *Machhi Singh v State of Punjab,* AIR 1983 SC 957 : 1983 Cr LJ 1457 : (1983) 3 SCC 470, a 3-Judge Bench of this Court following the decision in *Bachan Singh* (supra), observed:

> *that in rarest of rare cases when collective conscience of the community is so shocked that it will expect the holders of the judicial power centre to inflict death penalty irrespective of their personal opinion as regards desirability or otherwise of retaining death penalty. The community may entertain such a sentiment in the following circumstances:*
>
> ***I. When the murder is committed in an extremely brutal, grotesque, diabolical, revolting or dastardly manner so as to arouse intense and extreme indignation of the community. For instance,***
>
> *(i) when the house of the victim is set aflame with the end in view to roast him alive in the house;*
>
> *(ii) when the victim is subjected to inhuman acts of torture or cruelty in order to bring about his or her death; and*
>
> *(iii) when the body of the victim is cut into pieces or his body is dismembered in a fiendish manner.*
>
> ***II. When the murder is committed for a motive which, evinces total depravity and meanness. For instance when***
>
> *(a) hired assassin commits murder for the sake of money or reward; or*
>
> *(b) a cold-blooded murder is committed with a deliberate design in order to inherit property or to gain control over property of a ward or a person under the control of the murderer or vis-a-vis whom the murdered is in a dominating position or in a position of trust; or*
>
> *(c) a murder is committed in the course for the betrayal of the motherland.*
>
> ***III.***
>
> *(a) When murder of a member of a Scheduled Caste or minority community etc., is committed not for personal reasons but in circumstances etc., which arouse social wrath. For instance when such a crime is committed in order to terrorise such persons and frighten them into fleeing from a place or in order to deprive them of, or make them surrender, lands or benefits conferred on them with a view to reverse past injustices and in order to restore the social balance.*
>
> *(b) In cases of 'bride burning" and what are known as 'dowry deaths' or when murder is committed in order to remarry for the sake of extracting dowry once again or to marry another woman on account of infatuation.*
>
> ***IV. When the crime is enormous in proportion. For instance, when multiple murders say of all or almost all the members of a family or a large number of persons of a particular caste, community, or locality, are committed.***
>
> ***V. When the victim of murder is***
>
> *(a) an innocent child who could not have or has not provided even an excuse, much less a provocation, for murder;*
>
> *(b) a helpless woman or a person rendered helpless by old age or infirmity;*
>
> *(c) when the victim is a person vis-a-vis whom the murderer is in a position of domination or trust;*

(d) when the victim is a public figure generally loved and respected by the community for the services rendered by him and the murder is committed for political or similar reasons other than personal reasons.

In the said case, the Court further observed that in this background the guidelines indicated in the case of *Bachan Singh* (supra) will have to be culled out and applied to the facts of each individual case and where the question of imposing death sentence arises, the following proposition emerges from the case of *Bachan Singh* (supra):—

(i) The extreme penalty of death need not be inflicted except in gravest cases of extreme culpability.

(ii) Before opting for the death penalty the circumstances of the 'offender' also require to be taken into consideration along with the circumstances of the 'crime'.

(iii) Life imprisonment is the rule and death sentence is an exception. In other words death sentence must be imposed only when life imprisonment appears to be an altogether inadequate punishment having regard to the relevant circumstances of the crime, and provided, and only provided, the option to impose sentence of imprisonment for life cannot be conscientiously exercised having regard to the nature and circumstances of the crime and all the relevant circumstances.

(iv) A balance-sheet of aggravating and mitigating circumstances has to be drawn up and in doing so the mitigating circumstances have to be accorded full weightage and a just balance has to be struck between the aggravating and the mitigating circumstances before the option is exercised.

The Court thereafter observed that in order to apply these guidelines the following questions may be answered: —

(a) Is there something uncommon about the crime, which renders sentence of imprisonment for life inadequate and calls for a death sentence?

(b) Are the circumstances of the crime such that there is no alternative but to impose death sentence even after according maximum weightage to the mitigating circumstances which speak in favour of the offender?

Ultimately, in the said case of *Machhi Singh* (supra), the Court observed that if upon an overall global view of all the circumstances in the light of the aforesaid proposition and taking into account the answers to the questions posed hereinabove, the circumstances of the case are such that death sentence is warranted, the Court would proceed to do so.

In the light of the law already laid down by this Court referred to above, now this Court is called upon to consider whether the present case would come within the realm of the rarest of the rare or not.

The instant case is one wherein accused Sonia, along with accused Sanjiv [her husband] has not only put an end to the lives of her step-brother and his whole family, which included three tiny tots of 45 days, 2 and a half years and 4 years, but also her own father, mother and sister in a very diabolic manner so as to deprive her father from giving the property to her step-brother and his family. The fact that murders in question were committed in such a diabolic manner while the victims were sleeping, without any provocation whatsoever from the victims' side indicates the cold-blooded and premeditated approach of the accused to cause the death of the victims. The brutality of the act is amplified by the grotesque and revolting manner in which the helpless victims have been murdered which is indicative of the fact that the act was diabolic of most superlative degree in conception and cruel in execution and that both the accused persons are not possessed of the basic humanness and completely lack the psyche or mindset which can be amenable for any reformation. If this act is not revolting or dastardly, it is beyond comprehension as to what other act can be so.

In view of these facts we are of the view that there would be the failure of justice in case death sentence is not awarded in the present case as the same undoubtedly falls within the category of rarest of rare cases and the High Court was not justified in commuting death sentence into life imprisonment. In the result Criminal Appeal No. 142 of 2006 filed by the accused persons is dismissed whereas Criminal Appeal No. 895 of 2005 filed by private prosecutor and Criminal Appeal No. 894 of 2005 filed by the State of Haryana are allowed, order passed by the High Court commuting death sentence into life imprisonment is set aside and order of the trial court awarding death sentence is restored.

3.12.2 Court No Super Expert[18]

Author's Summary

This is an unfortunate situation where the trial court substituted his own opinion for that of medico-legal expert. SC depreciated the substitution:

"opinion is not only unwarranted but also indicative of lack of appreciation of the evidential value to be attached of expert medical evidence".

Highlights italicised

Relevant Extracts (verbatim)

The learned trial Judge in his reasoned judgment has taken the view that there is a fatal flaw in the prosecution case since the medical evidence does not support the case of the prosecution of assault on the deceased by so many persons at the same time in the manner and with the weapons stated. It is pointed out that, P.W. 20 Dr. Sankpal, Medical Officer, Primary Health Centre, Narayangaon who did the post-mortem on the body of deceased stated before the Court that there were in all 26 external injuries on the body of the deceased Namdeo. There were fractures found during the internal examination of the body. The external injuries Nos. 7, 22, 23 and 24 are punctured wounds with lacerated edges and the cause of the death of deceased Namdeo is shock due to rupture of left lung and multiple injuries. The left lung was ruptured apparently due to fractured ribs from 8th to 10th on left side.

The learned trial Judge has noted Dr. Sankpal's opinion that the punctured wounds were caused with hard and blunt object, such as, wooden sticks and iron rods and that Dr. Sankpal has identified the wooden sticks (article No. 44) and iron rod (article No. 42) to be the weapons which could have inflicted the punctured wounds on the body of Namdeo – and logically.

We are constrained to observe that the learned trial Judge was wrong in substituting the expert opinion of the Medical Officer, by his own and, therefore, his findings to the contrary are unjustified and unwarranted.

Dr. Sankpal, P.W. 20 in his deposition before the Court, in para 6 of his evidence, has opined that Injury Nos. 7, 23 and 25 are punctured wounds with lacerated edges. That these injuries could be caused with the rough end of the iron pipe shown to him. He has further stated that the said injuries can be caused with the wooden sticks and iron bar shown to him before the Court. Dr. Sankpal further opined that considering the nature and number of injuries the same must have been caused due to several strokes and the injuries are found to have been caused all over the body from head up to toe. *Nothing has been brought in the*

18. *Gulam Nurmamad Theim v State of Gujarat,* 2002 Cr LR (SC MAH GUJ) Guj 757 : 2002 (3) Guj LR 2642 : 2003 Cr LJ 356 (Guj).

cross-examination of Dr. Sankpal to discredit his expert opinion that the punctured wounds could have been caused with the wooden sticks and iron rod, namely, Articles 44 and 42. In fact, in his cross-examination, Dr. Sankpal has reiterated that the punctured wounds mentioned in column 17 of the notes could have been caused by Articles 42 and 44 and in order to inflict such wounds, those articles must have been thrust with sufficient force in the body. That the punctured wound with its rough and lacerated edges could be caused by edges of Articles 42 and 44.

Thus nothing has been brought in the cross-examination to reject the expert opinion of Dr. Sankpal that the punctured wounds were caused by the thrust of wooden sticks and iron rods and that the several injuries on the body of the deceased must have been caused due to several strokes inflicted by the accused with wooden sticks and iron rods. That the puncture wounds were caused by wooden sticks and iron rods and the severe nature of injuries caused by several strokes all over the body from head up to toe of the deceased resulted in the death of Namdeo due to shock and rupture of left lung and multiple injuries have been established beyond doubt.

The conclusion of the learned trial judge based on his personal opinion in the face of expert opinion is not only unwarranted but also indicative of lack of appreciation of the evidential value to be attached of expert medical evidence.

3.12.3 Expert Evidence[19]

Author's Summary

In this case, SC has provided detailed guideline on Expert Evidence. It has delineated what expert evidence is; who is real expert, what his functions are and what sort of expertise and its mode of presentation should be. It stressed that expert evidence is of advisory character and to courts is to form its own assessment.

Highlights italicised

Relevant Extracts (Verbatim)

The law of evidence is designed to ensure that the court considers only that evidence which will enable it to reach a reliable conclusion. The first and foremost requirement for an expert evidence to be admissible is that it is necessary to hear the expert evidence.

The test is that the matter is outside the knowledge and experience of the layperson. Thus, there is a need to hear an expert opinion where there is a medical issue to be settled. The scientific question involved is assumed to be not within the court's knowledge. Thus, cases where the science involved, is highly specialized and perhaps even esoteric, the central role of expert cannot be disputed. The other requirements for the admissibility of expert evidence are[20]:

(i) that the expert must be within a recognized field of expertise,

(ii) that the evidence must be based on reliable principles, and

(iii) that the expert must be qualified in that discipline.

(12) Section 45 of the Indian Evidence Act speaks of expert evidence. It reads as under:

19. *Ramesh Chandra Aggrawal v Regency Hospital Ltd,* AIR 2010 SC 806 : (2009)9 SCC 709 : (2009) 14 SCR 424.
20. *See* Alan Merry and Alexander Call Smith, *Errors, Medicine and the Law*, 2001 Edn, Cambridge University Press, p 178.

[s 45] Opinions of experts.—When the Court has to form an opinion upon a point of foreign law or of science or art, or as to identity of handwriting [21][or finger-impressions], the opinions upon that point of persons specially skilled in such foreign law, science or art, [22][or in questions as to identity of handwriting] [23][or finger impressions] are relevant facts. Such persons are called experts.

Illustrations

(a) The question is, whether the death of *A* was caused by poison. The opinions of experts as to the symptoms produced by the poison by which *A* is supposed to have died are relevant.

(b) The question is, whether *A*, at the time of doing a certain act, was, by reason of unsoundness of mind, incapable of knowing the nature of the Act, or that he was doing what was either wrong or contrary to law. The opinions of experts upon the question whether the symptoms exhibited by *A* commonly show unsoundness of mind, and whether such unsoundness of mind usually renders persons incapable of knowing the nature of the acts which they do, or knowing that what they do is either wrong or contrary to law, are relevant.

(c) The question is, whether a certain document was written by *A*. Another document is produced which is proved or admitted to have been written by *A*. The opinions of experts on the question whether the two documents were written by the same person or by different persons are relevant.

(13) The importance of the provision has been explained in the case of *State of Himachal Pradesh v Jai Lal,* AIR 1999 SC 3318 : (1999) 7 SCC 280 : 1999 Cr LJ 4294. It is held, that:

> Section 45 of the Evidence Act which makes opinion of experts admissible lays down that when the court has to form an opinion upon a point of foreign law, or of science, or art, or as to identity of handwriting or finger impressions, the opinions upon that point of persons specially skilled in such foreign law, science or art, or in questions as to identity of handwriting, or finger impressions are relevant facts. Therefore, in order to bring the evidence of a witness as that of an expert it has to be shown that he has made a special study of the subject or acquired a special experience therein or in other words that he is skilled and has adequate knowledge of the subject.

(14) It is not the province of the expert to act as Judge or Jury. It is stated in *Titli v Jones*, AIR 1934 All 237 : ILR 56 All 428 that the real function of the expert is to put before the court all the materials; together with reasons which induce him to come to the conclusion, so that the court, although not an expert, may form its own judgment by its own observation of those materials.

(15)

> *An expert is not a witness of fact. His evidence is really of an advisory character. The duty of an expert witness is to furnish the Judge with the necessary scientific criteria for testing the accuracy of the conclusions so as to enable the Judge to form his independent judgment by the application of these criteria to the facts proved by the evidence of the case. The scientific opinion evidence, if intelligible, convincing and tested becomes a factor and often an important factor for consideration along with other evidence of the case. The credibility of such a witness depends*

21. Ins. by Act 5 of 1899, section 3. For discussion in Council as to whether "finger impressions" include "thumb impressions", *see* Gazette of India, 1898, Part VI, p 24.
22. Ins. by Act 18 of 1872, section 4.
23. Ins. by Act 5 of 1899, section 3. For discussion in Council as to whether "finger impressions" include "thumb impressions", *see* Gazette of India, 1898, Part VI, p 24.

> *on the reasons stated in support of his conclusions and the data and material furnished which form the basis of his conclusions.*[24]

(16) In the case of *State of Maharashtra v Damu S/o Gopinath Shinde*, AIR 2000 SC 1691 (1700) : 2000 Cr LJ 2301 : 2000 AIR SCW 1617, it has been laid down that without examining the expert as a witness in Court, no reliance can be placed on opinion alone. In this regard, it has been observed in *The State (Delhi Administration) v Poli Ram,*[25] that:

> no expert would claim today that he could be absolutely sure that his opinion was correct, expert depends to a great extent upon the materials put before him and the nature of question put to him.

(17) In the article "Relevancy of Expert's Opinion" it has been opined that the value of expert opinion rests on the facts on which it is based and his competency for forming a reliable opinion. The evidentiary value of the opinion of expert depends on the facts upon which it is based and also the validity of the process by which the conclusion is reached. Thus the idea that is proposed in its crux means that the importance of opinion is decided on the basis of the credibility of the expert and the relevant facts supporting the opinion so that its accuracy can be cross checked. Therefore, the emphasis has been on the data on basis of which opinion is formed. The same is clear from following inference:

> *Mere assertion without mentioning the data or basis is not evidence, even if it comes from an expert. Where the experts give no real data in support of their options, the evidence even though admissible, may be excluded from consideration as affording no assistance in arriving at the correct value.*

3.12.4 Books as Authorities[26]

Author's Summary

In this murder case, the trial court depended upon books on the subject (authorities) to decide that the murder was by strangulation and not as given by the expert. Both the appellate court ruled that the books cannot take the place of the medico-legal expert who should have been confronted with the authorities, as the circumstances of the case in hand could be different. They reversed the trial court order.

Highlights italicised

Relevant Extracts (Verbatim)

The only circumstance which the trial Court relied upon to hold guilt was by referring to some textbooks on medical jurisprudence. With reference to them, it was held that the case of strangulation was clearly made out.

It cannot be said that the opinions of these authors were given in regard to circumstances exactly similar to those which arose in the case now before us nor is this a satisfactory way of dealing with or disposing of the evidence of an expert, examined in this case unless the passages, which are sought to be relied to discredit his opinion, are put to him.

This Court in *Sunderlal v State of Madhya Pradesh*, AIR 1954 SC 28 : 1954 Cr LJ 257, disapproved of Judges drawing conclusions adverse to the accused by relying upon such passages

24. *Malay Kumar Ganguly v Dr. Sukumar Mukherjee,* AIR 2010 SC 1162 : AIR 2010 SCW 769 : (2009) 9 SCC 221.
25. *The State (Delhi Administration) v Poli Ram,* AIR 1979 SC 14 : (1979) 2 SCC 158 : 1979 Cr LJ 17.
26. *State of Madhya Pradesh v Sanjay Rai,* 2004 Cr LJ 2007 (SC).

in the absence of their being put to medical witnesses. Similar view was expressed in *Bhagwan Das v State of Rajasthan*, AIR 1957 SC 589 : 1957 Cr LJ 889 : 1957 SCJ 515.

Though opinions expressed in textbooks by specialist authors may be of considerable assistance and importance for the Court in arriving at the truth, they cannot always be treated or viewed to be either conclusive or final as to what such author says to deprive even a Court of law to come to an appropriate conclusion of its own on the peculiar facts proved in a given case. In substance, though such views may have persuasive value, they cannot always be considered to be authoritatively binding, even to dispense with the actual proof otherwise reasonably required of the guilt of the accused in a given case. Such opinions cannot be elevated to or placed on a higher pedestal than the opinion of an expert examined in Court and the weight ordinarily to which it may be entitled to or deserves to be given.

Apart from that, even if on the hypothetical basis it is held that doubt could arise on the basis of strangulation, in the absence of any evidence whatsoever to connect the respondent-accused with the act of strangulation, the conclusion of the trial court could not have been maintained and the High Court which is entitled to re-appreciate the evidence could and has rightly discarded it.

3.12.5 Report under section 293 Cr PC Admissible[27]

Author's Summary

It is a simple case of liquor smuggling in which the culprits were convicted. They went in appeal on the plea that testing was delayed, and no expert gave evidence in person. The plea was rejected by all the appellate courts including SC. It remarked that section 293 of CrPC makes the personal attendance of the expert redundant.

Highlights italicised

Relevant Extracts (Verbatim)

Background facts in a nutshell are as follows:

> The appellants were alleged to have been indulging in smuggling of liquor from Haryana to Delhi. The prosecution alleged that upon receipt of information, S.I. Lalit Mohan, along with certain police officials, constituted a raiding party, assembled near a traffic intersection and on 8-4-1994 at about 1.45 A.M. intercepted a Tata 407 vehicle in which the appellants were travelling. Despite being signalled to stop, the vehicle sped away. The police officials chased it, and stopped it and apprehended the appellants. Eighteen cartons containing 12 bottles of "Bonnie Scot" Special Malt Whisky, each being a 750 ml bottle, were recovered. Two sample bottles were taken out separately as samples and (from each carton *i.e.*, 36 bottles). The heads of the samples bottles were enclosed in White Pullanda and sealed with the letters "LMN". Form M-29 was also filled. The seal was handed over to Head Constable Satpal Singh. An FIR was lodged and a site plan was prepared. The appellants were arrayed as accused and arrested. The Excise Control Laboratory opined that the samples submitted tested positive as Whisky." (The appellants were charged with having committed an offence under section 61 of the Punjab Excise Act, 1914 (in short the 'Act'). They stood trial pleading not guilty.
>
> 4. The prosecution examined three witnesses. All of them testified as to recovery of the samples. The accused persons did not lead any evidence in their defence. They

27. *Rajesh Kumar v State (Govt of NCT of Delhi),* (2008) 4 SCC 493 : 2008 (3) Scale 87.

however, denied the accusations through statements under section 313 of the Criminal Procedure Code, 1973 (in short the 'Cr.P.C.')

5. The Metropolitan Magistrate *i.e.*, the trial court by judgment and order dated 1-5-2001 found the appellants guilty and sentenced them to six months simple imprisonment with fine of Rs. 2,000 and in default a further three months simple imprisonment. The appeal preferred by the petitioners to the Additional Sessions Judge was dismissed by order dated 22-2-2006.

6. ***The only stand before the High Court was that there was a delay in dispatch of the sample and none was examined to prove the reports.***

The High Court found that there was no substance in the plea. Referring to the evidence of SI PW 3 and PW 1 about the sealing and sending samples to the Excise Control Laboratory, it was noted that the Form M-29 was filled up by PW-2 at the time of recovery.

All the prosecution witnesses have testified that the same was filled up by PW 3. The seal after use was handed over to PW 1. These were tallied with the specimen seal of M-29 when the Excise Control Laboratory sealed them. It was noted that there was no necessity for examining any witness to prove the Excise Control Laboratory report as documents were marked in terms of section 293 Cr.P.C.

7. Learned counsel for appellants reiterated the submissions made before the High Court. Learned counsel for the respondent, on the other hand, supported the judgment of the High Court. It is submitted that no question was put to either PW-1 or PW-3 on the aspect of alleged delay in sending the samples.

8. Section 293 Cr.P.C. reads as follows:

"293. Reports of certain Government scientific experts.

(1) Any document purporting to be a report under the hand of a Government scientific expert to whom this section applies, upon any matter or thing duly submitted to him for examination or analysis and report in the course of any proceeding under this Code, may be used as evidence in any inquiry, trial or other proceeding under this Code.

(2) The Court may, if it thinks fit, summon and examine any such expert as to the subject-matter of his report.

(3) Where any such expert is summoned by a Court and he is unable to attend personally, he may, unless the Court has expressly directed him to appear personally, depute any responsible officer working with him to attend the Court, if such officer is conversant with the facts of the case and can satisfactorily depose in Court on this behalf.

(4) This section applies to the following Government scientific experts, namely:—

(a) any Chemical Examiner or Assistant Chemical Examiner to Government;

(b) the Chief Controller of Explosives;

(c) the Director of the Finger Print Bureau;

(d) the Director, Haffkeine Institute, Bombay;

(e) the Director [Deputy Director or Assistant Director] of a Central Forensic Science Laboratory or a State Forensic Science Laboratory;

(f) the Serologist to the Government;

(g) any other Government Scientific Expert specified by notification, by Central Government for this purpose.]"

9. A bare reading of sub-sections (1) and (2) of section 293 shows that

it is not obligatory that an expert who furnishes his opinion on the scientific issue of the chemical examination of substance, should be of necessity made to depose in proceedings before Court.

This aspect has been highlighted by this Court in *Ukha Kolhe v State of Maharashtra,* AIR 1963 SC 1531 and *Bhupinder Singh v State of Punjab*, AIR 1988 SC 1011. Therefore, there is no substance in the revision petition so far as the conviction is concerned.

3.12.6 "Rarest or Rare Case"[28]

Author's Summary

A girl from Delhi was inveigled by a rapist for repeated sex on the promise of marrying her. She got pregnant. The rapist wanted her to abort, which she resisted. He ultimately took her in his mother's car, on the pretext of marrying her at Haridwar, to a secluded place and tried to kill her by beating with jack and panna, cut her with blades and throwing acid on her person. Police hearing the shrieks, reached the spot; caught hold of the culprits. There were no eyewitness. However, she was alive when the police reached the scene. She could give the details of the brutalities she suffered. Thereafter she died. The DNA connect of the culprit with the foetus clinched the case against the culprit.

Highlights italicised

Relevant Extracts (Verbatim)

Shorn of unnecessary facts, the case of the prosecution as projected before the trial Court was that on 17-11-2004 Inspector D.N. Verma (PW-1) along with Sub-Inspector Chander Pal Singh (PW-2), Constable Rambir Singh, Constable Sukhram, Constable Ashok Kumar and Driver Yashvir Singh were on patrolling duty; that when they reached ahead of Badsu on Khatoli Road leading towards Falut, they met Constable Rajesh Kumar and another Constable Ramavtar who informed PW-1 and other persons accompanying him that one Indica car took a turn for going towards Falut road and that they heard some screaming noise from that vehicle. PW-1, accompanied by the other personnel referred to above, proceeded towards Falut road and after a distance saw an Indica car. They stated to have seen through the focus light of the police jeep two young men trying to pull out a girl in an injured condition by opening the rear door of the car. It is stated that it was around 2130 hours. The police jeep in which PW-1 and others were proceeding stopped ahead of the Indica car and caught hold of the two young men and also noticed a girl, with injuries all over, on whom acid was also sprinkled. The girl had also sustained injuries on the head as well as on her right cheek. On noticing the above, according to PW-1, when he questioned her, she responded by stating that her name was Jyoti and she is the daughter of one Baljeet Singh, R/o Lane No. 16, House No. 56, Jagatpuri, P.S. Preet Vihar, New Delhi and that her mother's name was Varsha whose cell number was 9871020368. Inspector D.N. Verma (PW-1) stated to have gathered information from her that she developed friendship with the appellant Sandeep while she was working in a mobile shop. She also stated to have revealed that she was pregnant. According to the information gathered from Jyoti, accused Sandeep had called her on that evening and asked her to come to Laxmi Nagar market, Delhi, around 6 p.m. promising her that he will marry her at Haridwar. Believing his words, she went to Laxmi Nagar market from where she was taken in a car and that while they were moving in the vehicle, accused Sandeep asked Jyoti to get the foetus aborted at Meerut, to which she disagreed. On this, he started beating her inside the vehicle right from the point of Modinagar. She stated to have further informed PW-1 and others that she told accused Sandeep that she would reveal all facts to his family members as well as to the police and that when the vehicle in which they were travelling turned towards an isolated place near Khatoli, they tried to throw her into the sugarcane field at which point of time PW-1 and other police members reached the spot. According to her information to PW-1, accused Sandeep and Shashi Bhushan caused the injuries

28. *Sandeep v State of Uttar Pradesh,* (2012) 6 SCC 107 : 2012 (5) Scale 444.

on her with the aid of a jack and pana (spanner), apart from cutting her with a blade and also by pouring acid on her head. PW-1 stated that on noticing the condition of the girl, he arranged for shifting her to Muzaffarnagar Government Hospital in the police jeep along with Constable Rambir Singh and the driver of the jeep. It was further stated that accused Sandeep and Shashi Bhushan, on being apprehended, also revealed their names and informed that accused Sandeep used to visit deceased Jyoti while she was working in a mobile shop in Mayur Vihar Phase-l for the last six months prior to the date of occurrence and developed friendship with her, and that in course of time, deceased Jyoti pressurized him to marry her. On the date of occurrence, around 6 p.m. he stated to have called her over phone to meet him at Laxmi Nagar red light, that she responded to his call and came to Laxmi Nagar red light where accused Sandeep was waiting along with his friend Shashi Bhushan who drove the vehicle Indica car bearing registration No. DL 3 CR 6666 which belonged to his mother.

Accused Sandeep stated to have extended a promise to marry her at Haridwar. While the vehicle started moving, accused Sandeep asked Jyoti to get the foetus aborted to which she did not agree, instead threatened him by saying that she will reveal all facts to his parents as well as to the police and that as they reached Modinagar, he started beating her.

According to the version of accused Sandeep, as told to PW 1, at Modinagar he purchased two bottles of acid and four shaving blades, that when they reached Khatoli, on seeing an isolated place, they tried to pull out the injured Jyoti from the vehicle and that at that point of time they were apprehended by the police. It is the case of the prosecution that while both the accused were taken into custody, the vehicle in which they were travelling was also seized along with the jack and pana, four blades and two acid bottles. The articles, namely, blood stained floor mat, empty bottles of acid, one pair of ladies footwear were stated to have been seized after preparing a seizure memo. A copy of the seizure memo was stated to have been handed over to the accused. It is the specific case of the prosecution that since it was late in the night and it was a lonely place, there were no independent witnesses other than the police personnel. The seizure memo was marked as Exhibit K-1.

Keeping the above respective submissions in mind, when we analyze the case in hand the following facts are indisputable:—

1. *The relationship of Sandeep with deceased, prior to the date of occurrence, namely, 17-11-2004 as his girlfriend;*
2. *The deceased was carrying the foetus of six months old in her womb;*
3. *The Indica car in which the deceased was found on the date and time of occurrence belonged to the mother of accused Sandeep.*
4. *At the time when the deceased was secured by the police on 17-11-2004 at 21.30 hours she was seriously injured but was alive.*
5. *The death of the deceased was ascertained by Dr B.S. Chaudhary (PW-6) at 10.55 p.m.;*
6. *As per the post-mortem certificate, there were as many as 17 injuries which were caused by blunt weapons like jack and pana (spanner), shaving blades and also chemical acid;*
7. *Police witnesses were all on patrol duty on the date of occurrence;*
8. *The DNA test disclosed that accused Sandeep was the biological father of the foetus found in the womb of the deceased;*
9. *The theory propounded by the accused i.e. the car was stolen on 17-11-2004 was not established before the trial court in the manner known to law;*
10. *The statement of the accused as stated to have been made to PW-1 contained various facts unconnected to the crime and also the self-incriminating facts which could be distinguished;*
11. *The absence of any independent witness at the place of occurrence.*

Having regard to the above factors, we are convinced that the case of prosecution that the deceased made a statement about the sequence of the occurrence was really made as spelt out by the witnesses PW Nos. 1 to 5.

When we come to the question of the sentence of death as imposed by learned Sessions Judge, which was also confirmed by the Division Bench as against the accused Sandeep, the same will have to be examined in the light of the principles laid down in the various decisions of this Court.[29] The principle of 'rarest of rare case' enunciated in *Bachan Singh* (supra) has been restated and emphasised time and again in the above referred to decisions. In order to appreciate the principle in a nutshell, what is stated in *Haresh Mohandas Rajput* (supra) can be usefully referred to which reads as under:—

"20. The rarest of rare case" comes when a convict would be a menace and threat to the harmonious and peaceful coexistence of the society. The crime may be heinous or brutal but may not be in the category of "the rarest of the rare case". There must be no reason to believe that the accused cannot be reformed or rehabilitated and that he is likely to continue criminal acts of violence as would constitute a continuing threat to the society. The accused may be a menace to the society and would continue to be so, threatening its peaceful and harmonious coexistence. The manner in which the crime is committed must be such that it may result in intense and extreme indignation of the community and shock the collective conscience of the society. Where an accused does not act on any spur-of-the-moment provocation and indulges himself in a deliberately planned crime and meticulously executes it, the death sentence may be the most appropriate punishment for such a ghastly crime. The death sentence may be warranted where the victims are innocent children and helpless women. Thus, in case the crime is committed in a most cruel and inhuman manner which is an extremely brutal, grotesque diabolical, revolting and dastardly manner, where his act affects the entire moral fibre of the society *e.g.,* crime committed for power of political ambition or indulging in organized criminal activities, death sentence should be awarded."

It is, therefore, well-settled that awarding of life sentence is the rule, death is an exception. The application of the 'rarest of rare case' principle is dependent upon and differs from case to case. However, the principles laid down earlier and restated in the various decisions of this Court referred to above can be broadly stated that in a deliberately planned crime, executed meticulously in a diabolic manner, exhibiting inhuman conduct in a ghastly manner touching the conscience of everyone and thereby disturb the moral fibre of the society would call for imposition of capital punishment in order to ensure that it acts as a deterrent.

Case of the prosecution based on the evidence displayed, confirmed the commission of offence by the appellants, without any iota of doubt, we are of the considered opinion, that still the case does not fall within the four corners of the principle of the 'rarest of the rare case'. However, considering the plight of the hapless young lady, who fell a victim to the avaricious conduct and lust of the appellant Sandeep, the manner in which the life of the deceased was snatched away by causing multiple injuries all over the body with all kinds of weapons, no leniency can be shown to the said appellant. In the decision reported in *Swamy Sharaddananda* (supra) even while setting aside the sentence of death penalty and awarding the life imprisonment, it was explained that in order to serve ends of justice, the appellant therein should not be released from the prison till the end of his life. Likewise, in *Ramraj v State of Chhattisgarh*, AIR 2010 SC 420 : 2010 Cr LJ 2062 : 2010 AIR SCW 23 this Court, while setting aside the death sentence, directed that the appellant therein should serve a minimum period of 20 years including the remissions and would not be released on completion of 14 years of imprisonment.

29. *Bachan Singh v State of Punjab*, AIR 1980 SC 898 : (1980) 2 SCC 684 : 1980 Cr LJ 636; *Machhi Singh v State of Punjab,* AIR 1983 SC 957 : (1983) 3 SCC 470 : 1983 Cr LJ 1457; *Swamy Shraddananda v State of Karnataka*, AIR 2008 SC 3040 : AIR 2008 SCW 5110 : (2008) 13 SCC 767; *Santosh Kumar Satishbushan Bariyar v State of Maharashtra,* AIR 2010 SC (Supp) 612 : AIR 2010 SCW 1130 : (2009) 6 SCC 498; *Mohd. Farooq Abdul Gafur v State of Maharashtra,* AIR 2010 SC (Supp) 884 : (2010) 14 SCC 641 : (2009) 11 Scale 327; *Haresh Mohandas Rajput v State of Maharashtra*, AIR 2011 SC 3681 : AIR 2011 SCW 5414 : (2011) 12 SCC 56; *State of Maharashtra v Goraksha Ambaji Adsul*, AIR 2011 SC 2689 : AIR 2011 SCW 4208 : 2011 Cr LJ 4286.

66. Therefore, in the evidence of PW 10, Junior Scientific Officer of the Central Forensic Laboratory, Chandigarh, it was brought out that the blood samples of accused Sandeep and the foetus received by him on 27-1-2005 and that necessary test was conducted based on which a report on 13-B/1, 13-A/2 and 13-C/3 was forwarded which confirmed that the accused Sandeep was the biological father of the foetus. He also confirmed in the cross-examination that the earlier sample of the foetus preserved in formalin solution received on 5-1-2005 was returned back without opening the seal as the same was kept in formalin solution and standard protocol analysis was not available in the laboratory. He further confirmed that when the sample on second time was received along with the letter dated 25-1-2005, the same was preserved in ice separately which they were able to test in their laboratory for finding out the result. It has also come in his evidence that the collection of samples, preservation of samples and transportation of samples if not carefully done, it may affect the result, but in the case on hand the result reported by him was not based on wrong facts.

67. In the light of the said expert evidence of the Junior Scientific Officer it is too late in the day for the appellant Sandeep to contend that improper preservation of the foetus would have resulted in a wrong report to the effect that the accused Sandeep was found to be the biological father of the foetus received from the deceased Jyoti. As the said submission is not supported by any relevant material on record and as the appellant was not able to substantiate the said argument with any other supporting material, we do not find any substance in the said submission. The circumstance, namely, the report of the DNA in having concluded that accused Sandeep was the biological father of the recovered foetus of Jyoti was one other relevant circumstance to prove the guilt of the said accused.

> 75. Taking note of the above decision and also taking into account the facts and circumstances of the case on hand, while holding that the imposition of death sentence to the accused Sandeep was not warranted and while awarding life imprisonment, we hold that accused Sandeep must serve a minimum of 30 years in jail without remissions before consideration of his case for premature release.

3.12.7 Court No Super Expert[30]

Author's Summary

This is an unfortunate situation where the trial court substituted his own opinion for that of medico-legal expert. SC depreciated the substitution:

"opinion is not only unwarranted but also indicative of lack of appreciation of the evidential value to be attached of expert medical evidence".

Highlights italicised

Relevant Extracts (Verbatim)

The learned-trial Judge in his reasoned judgment has taken the view that there is a fatal flaw in the prosecution case since the medical evidence does not support the case of the prosecution of assault on the deceased by so many persons at the same time in the manner and with the weapons stated. It is pointed out that, P.W. 20 Dr. Sankpal, Medical Officer, Primary Health Centre, Narayangaon who did the post-mortem on the body of deceased stated before the Court that there were in all 26 external injuries on the body of the deceased Namdeo. There were fractures found during the internal examination of the body. The external injuries Nos. 7, 22, 23 and 24 are punctured wounds with lacerated edges and the cause of the death of deceased Namdeo is shock due to rupture of the left

30. *Gulam Nurmamad Theim v State of Gujarat,* 2002 Cr LR (SC MAH GUJ) Guj 757 : 2002 (3) Guj LR 2642 : 2003 Cr LJ 356 (Guj).

lung and multiple injuries. The left lung was ruptured apparently due to fractured ribs from 8th to 10th on left side.

The learned trial Judge has noted Dr. Sankpal's opinion that the punctured wounds were caused with hard and blunt object, such as, wooden sticks and iron rods and that Dr. Sankpal has identified the wooden sticks (article No. 44) and iron rod (article No. 42) to be the weapons which could have inflicted the punctured wounds on the body of Namdeo – and logically.

We are constrained to observe that the learned trial Judge was wrong in substituting the expert opinion of the Medical Officer, by his own and, therefore, his findings to the contrary are unjustified and unwarranted.

Dr. Sankpal, P.W. 20 in his deposition before the Court, in para 6 of his evidence, has opined that Injury Nos. 7, 23 and 25 are punctured wounds with lacerated edges. That these injuries could be caused with the rough end of the iron pipe shown to him. He has further stated that the said injuries can be caused with the wooden sticks and iron bar shown to him before the Court. Dr. Sankpal further opined that considering the nature and number of injuries the same must have been caused due to several strokes and the injuries are found to have been caused all over the body from head up to toe. *Nothing has been brought in the cross-examination of Dr. Sankpal to discredit his expert opinion that the punctured wounds could have been caused with the wooden sticks and iron rod, namely, Articles 44 and 42. In fact, in his cross-examination, Dr. Sankpal has reiterated that the punctured wounds mentioned in column 17 of the notes could have been caused by Articles 42 and 44 and in order to inflict such wounds, those articles must have been thrust with sufficient force in the body. That the punctured wound with its rough and lacerated edges could be caused by edges of Articles 42 and 44.*

Thus nothing has been brought in the cross-examination to reject the expert opinion of Dr. Sankpal that the punctured wounds were caused by the thrust of wooden sticks and iron rods and that the several injuries on the body of the deceased must have been caused due to several strokes inflicted by the accused with wooden sticks and iron rods. That the puncture wounds were caused by wooden sticks and iron rods and the severe nature of injuries caused by several strokes all over the body from head up to toe of the deceased resulted in the death of Namdeo due to shock and rupture of left lung and multiple injuries has been established beyond doubt.

The conclusion of the learned trial judge based on his personal opinion in the face of expert opinion is not only unwarranted but also indicative of lack of appreciation of the evidential value to be attached of expert medical evidence.

3.12.8 Benefit of Doubt[31]

Author's Summary

About 90 % criminals committing heinous crime are given benefit of doubt and acquitted, making mockery of the criminal justice. Proof beyond reasonable doubt is a guideline, not a fetish. A fair doubt is based upon reason and common sense. It must grow out of the evidence. The SC, in this case, has quoted chapter and verse from case law that exaggerated devotion to the rule of benefit of doubt must not nurture fanciful doubts or lingering suspicion and thereby destroy social defence.

It is a case of drug trafficking where the traffickers wanted to get the benefit of doubt.

Highlights italicised

31. *Iqbal Moosa Patel v State of Gujarat*, AIR 2011 SC (Supp) 470 : (2011) 2 SCC 198.

Relevant Extracts (Verbatim)

The facts giving rise to the conviction and sentence of the appellants have been set out in detail by the High Court in the order under appeal hence need not be detailed over again except to the extent it is absolutely necessary to do so. Briefly stated the prosecution case is that a certain secret information was received by Mr. K.C. Chudasma, Inspector, Anti-Terrorist Squad which was passed on to Mr. P.S. Tomar, Zonal Director, Narcotics Control Bureau, Ahmedabad. The information suggested that Accused No. 2 Mr. Hemaram Chaudhary was the kingpin of a syndicate involved in smuggling and interstate trafficking of narcotic substances. Accused No. 3 Shri Derajram Jat was the man allegedly carrying out the operations at the instance of the said Mr. Hemaram Chaudhary. The information so received was used to intercept and search a truck bearing registration number RJ-04-G-1305 on 29th June, 2001 at Lal Bahadur Shastri Bridge, Pirana area in the city of Ahmedabad while the same was returning from Bharuch. The truck was driven by accused No. 4-Ashuram Durgaram Choudhary while accused No. 3 Derajram Jat was accompanying him. The search of the truck led to the seizure of psychotropic drugs from the aforesaid two persons who revealed that the consignment in question had been supplied by Mr. Hemaram Choudhary-accused No. 2.

On the basis of the information so collected and the disclosure made by the driver of the truck and Derajram Jat-accused No. 3. Appellant-lqbal Moosa Patel was taken into custody and his statement under section 67 of the NDPS Act recorded. A raid was then carried out on 7th July, 2001 at village Varadia, Khadaki Street, District Bharuch, which led to the seizure of heroin weighing 3.056 kgs. and cash of Rs. 1,17,500 from the residence of appellant No. 1 Iqbal Moosa Patel. In his statement recorded under section 67 of the N.D.P.S. Act the said accused admitted having purchased four packets of brown sugar from one Master and Bhaikhanbhai both residents of Badmer in Rajasthan in the month of March, 2001, out of which one packet had already been sold to one Shakur while the remaining three were seized by the respondent from his residence as mentioned above.

On the basis of the material placed before the trial court the accused persons were charged with different offences to which the accused pleaded not guilty and claimed a trial.

13. That brings us to the question whether the appellants could be given the benefit of doubt having regard to the nature of the evidence adduced by the prosecution against them. We do not think that the appellants have made out a case for grant of any such benefit.

It is true that the prosecution is required to establish its case beyond a reasonable doubt, but that does not mean that the degree of proof must be beyond a shadow of doubt. The principle as to what degree of proof is required is stated by Lord Denning in his inimitable style in *Miller v Minister of Pensions*, (1947) 2 All ER 272 : 177 LT 536 : 63 TLR 474:

That degree is well-settled. It need not reach certainty, but it must carry a high degree of probability. Proof beyond reasonable doubt does not mean proof beyond a shadow of a doubt. The law would fail to protect the community if it permitted fanciful possibilities to deflect the course of justice. If the evidence is so strong against a man as to leave only a remote possibility in his favour which can be dismissed with sentence of course, it is possible but not in the least probable,' the case is proved beyond reasonable doubt....

It is true that under our existing jurisprudence in a criminal matter, we have to proceed with the presumption of innocence, but at the same time, that presumption is to be judged on the basis of conceptions of a reasonable prudent man. Smelling doubts for the sake of giving benefit of doubt is not the law of the land."

14. *Reference may also be made to the decision of this Court in Sucha Singh v State of Punjab,* (2003) 7 SCC 64 : AIR 2003 SC 3617 : 2003 AIR SCW 3984*, where this Court has reiterated the principle in the following words:*

".....Exaggerated devotion to the rule of benefit of doubt must not nurture fanciful doubts or lingering suspicion and thereby destroy the social defence. Justice cannot be made sterile on the plea that it is better to let a hundred guilty escape than punish an innocent Letting

the guilty escape is not doing justice according to law. [See Gurbachan Singh *v* Satpal Singh, AIR 1990 SC 209 : 1990 Cr LJ 562 : JT 1989 (4) SC 38].

Prosecution is not required to meet any and every hypothesis put forward by the accused. A reasonable doubt is not an imaginary, trivial or merely possible doubt, but a fair doubt based upon reason and common sense. It must grow out of the evidence in the case. If a case is proved perfectly, it is argued that it is artificial; if a case has some flaws inevitable because human beings are prone to err, it is argued that it is too imperfect. One wonders whether in the meticulous hypersensitivity to eliminate a rare innocent from being punished, many guilty persons must be allowed to escape.

Proof beyond reasonable doubt is a guideline, not a fetish."

3.12.9 Expert v Ocular Evidence[32]

Author's Summary

It is a case of murder where the IO and the Medico-legal doctor showed extreme degree of dereliction of duty. The IO lost the material evidence. The doctor refused to record injuries on the person of the deceased. SC felt that the dereliction of duties was deliberate. They discarded his evidence.

The eyewitness evidence was reliable and sufficient. They convicted the culprit and wrote to government to take action against the derelicts.

Highlights italicised

Relevant Extracts (Verbatim)

In the presence of panchas, including Balwant Singh, PW8, he noticed that there were three injuries on the person of the deceased, Pyara Singh and prepared Inquest Report *vide* Ex. Ka-6 recording his opinion that the deceased died on account of the injuries found on his body. After preparing the site plan, Ext. Ka-10, he also wrote a letter to the Superintendent, Civil Hospital, Haldwani for post-mortem, being Exhibit Ka-9. The dead body was taken to the said hospital by Constable Chandrapal Singh, PW 7. Dr. C.N. Tewari, PW-3, medical officer in the Civil Hospital, Haldwani, performed the post-mortem upon the body of the deceased and did not find any ante-mortem or post-mortem injuries on the dead body. On internal examination, he did not find any injuries and could not ascertain the cause of death. Further, he preserved the viscera and gave the post-mortem report, Exhibit Ka-4. After noticing that there was no injury or abnormality found upon external and internal examination of the dead body, the doctor in his report recorded as under:

"Viscera in sealed jars handed over to the accompanying Constables.

Jar No. 1 sample preservative saline water.

Jar No. 2 Pieces of stomach

Jar No. 3 Pieces of liver, spleen and kidney.

Death occurred about one day back.

Cause of death could not be ascertained. Hence, viscera preserved.

It appears from the record that the deceased's viscera, which allegedly was handed over by doctor to the police, was either never sent to the Forensic Science Laboratory (for short, the 'FSL') for chemical examination, or if sent, the report thereof was neither called for nor proved before the Court. In fact, this has been left to the imagination of the Court.

32. *Dayal Singh v State of Uttaranchal,* AIR 2012 SC 3046 : (2012) 8 SCC 263 : 2012 Cr LJ 4323.

Considering the ocular and other evidence produced by the prosecution, the learned trial court *vide* its judgment of conviction and order of sentence, both dated 29 June 1990, found the accused persons guilty of offences under section 302 read with section 34 IPC as well as under section 323 read with section 34, Indian Penal Code. The Trial Court, while dealing with the arguments of the accused for application of section 34, as well as the submission that the witnesses had not attributed specific role to the respective accused persons, held as under:

> The attack was premeditated and the accused had come fully prepared to do the overt act. The injury was caused on the head of the deceased which is a vital part of the body at which it was aimed by employing lathi, it was clear that the accused persons had intended to cause death by giving a blow on vital part of the body of the deceased. After receiving the injuries, the deceased fell down and even thereafter he was attacked by the accused persons and he died on the spot immediately. The expert witness is expected to put before the Court all materials inclusive of the data which induced him to come to the conclusion and enlighten the court on the technical aspect of the case by examining the terms of science, so that the court, although not an expert, may form its own judgment on those materials after giving due regard to the expert's opinion, because once the expert opinion is accepted, it is not the opinion of the medical officer but that of the Court. [See *Madan Gopal Kakkad v Naval Dubey*, (1992) 2 SCR 921 : (1992) 3 SCC 204 : 1992 AIR SCW 1480].

31. Profitably, reference to the value of an expert in the eye of law can be assimilated as follows:

> *The essential principle governing expert evidence is that the expert is not only to provide reasons to support his opinion but the result should be directly demonstrable. The court is not to surrender its own judgment to that of the expert or delegate its authority to a third party, but should assess his evidence like any other evidence. If the report of an expert is slipshod, inadequate or cryptic and the information of similarities or dissimilarities is not available in his report and his evidence in the case, then his opinion is of no use. It is required of an expert whether a government expert or private, if he expects, his opinion to be accepted to put before the court the material which induces him to come to his conclusion so that the court though not an expert, may form its own judgment on that material. If the expert in his evidence as a witness does not place the whole lot of similarities or dissimilarities,, which influence his mind to lead him to a particular conclusion which he states in the court then he fails in his duty to take the court into confidence. The court is not to believe the* ipse dixit *of an expert. Indeed the value of the expert evidence consists mainly on the ability of the witness by reason of his special training and experience to point out the court such important facts as it otherwise might fail to observe and in so doing the court is enabled to exercise its own view or judgment respecting the cogency of reasons and the consequent value of the conclusions formed thereon. The opinion is required to be presented in a convenient manner and the reasons for a conclusion based on certain visible evidence, properly placed before the Court. In other words the value of expert evidence depends largely on the cogency of reasons on which it is based.*

[See: BR Sharm, *Forensic Science in Criminal Investigation & Trial,* 4th Edn]

38. The purpose of expert testimony is to provide the trier of fact with useful, relevant information. The overwhelming majority rule in the United States, is that an expert need not be a member of a learned profession. Rather, experts in the United States have a wide range of credentials and testify regarding a tremendous variety of subjects based on their skills, training, education or experience. The role of the expert is to apply or supply specialized, valuable knowledge that lay jurors would not be expected to possess. An expert may present the information in a manner that would be unacceptable with an ordinary witness. The common law tried to strike a balance between the benefits and dangers of expert testimony by allowing expert testimony to be admitted only if the testimony were particularly important to aiding the trier of fact. Even in United States, if the helpfulness of expert testimony is substantially outweighed by the risk of unfair prejudice, confusion or waste of time, then the testimony should be excluded under the relevant Rules, and State equally balanced. Expert testimony on any issue of fact and significance of its application

has been doubted by the scholars in the United States. Even under the law prevalent in that country, the opinion of an expert has to be scientific, specific and experience based. Conflict in expert opinions is a well prevalent practice there. The skill and experience of an expert is the ethos of his opinion, which itself should be reasoned and convicting. Not to say that no purview would be possible, but if the view of the expert has to find due weightage in the mind of the Court, it has to be well authorised and convincing.

Dr. C.N. Tewari was expected to prepare the post-mortem report with appropriate reasoning and not leave everything to the imagination of the Court. He created a serious doubt as to the very cause of death of the deceased. His report apparently shows an absence of skill and experience and was, in fact, a deliberate attempt to disguise the investigation.

We really need not reiterate various judgments, which have taken the view that the purpose of an expert opinion is primarily to assist the Court in arriving at a final conclusion. Such report is not binding upon the Court. The Court is expected to analyse the report, read it in conjunction with the other evidence on record and then form its final opinion as to whether such report is worthy of reliance or not. Just to illustrate this point of view, in a given case, there may be two diametrically contradictory opinions of handwriting experts and both the opinions may be well reasoned. In such case, the Court has to critically examine the basis, reasoning, approach and experience of the expert to come to a conclusion as to which of the two reports can be safely relied upon by the Court.

The assistance and value of an expert opinion is indisputable, but there can be reports which are, ex facie, incorrect or deliberately so distorted as to render the entire prosecution case unbelievable. But if such eyewitnesses and other prosecution evidence are trustworthy, have credence and are consistent with the eye version given by the eye-witnesses, the Court will be well within its jurisdiction to discard the expert opinion. An expert report, duly proved, has its evidentiary value but such appreciation has to be within the limitations prescribed and with careful examination by the Court. A complete contradiction or inconsistency between the medical evidence and the ocular evidence on the one hand and the statement of the prosecution witnesses between themselves on the other, may result in seriously denting the case of the prosecution in its entirety but not otherwise[33].

3.13 ADDITIONAL CASE LAW

3.13.1 Expert Evidence[34]

The essential principle governing expert evidence is that the expert is not only to provide reasons to support his opinion, but the result should be directly demonstrable. The court is not to surrender its own judgment to that of the expert or delegate its authority to a third party, but should assess his evidence like any other evidence. If the report of an expert is slipshod, inadequate or cryptic and the information of similarities or dissimilarities is not available in his report and his evidence in the case, then his opinion is of no use. It is required of an expert whether a government expert or private, if he expects, his opinion to be accepted to put before the court the material which induces him to come to his conclusion so that the court though not an expert, may form its own judgment on that material. If the expert in his evidence as a witness does not place the whole lot of similarities or dissimilarities,, which influence his mind to lead him to a particular conclusion which he states in the court then he fails in his duty to take the court into confidence. The court is not to believe the *ipse dixit* of an expert. Indeed the value of the expert evidence consists mainly on the ability of the witness by reason of his special training and experience to point out the court such important facts as it otherwise might fail to observe and in so doing the

33. *Madan Gopal Kakkad v Naval Dubey*, AIR 1992 SCW 1480 : (1992) 3 SCC 204 : (1992) 2 SCR 921.
34. *Chunni Lal v State of Haryana*, 1977 Cr LJ (Notes) HC.

court is enabled to exercise its own view or judgment respecting the cogency of reasons and the consequent value of the conclusions formed thereon. The opinion is required to be presented in a convenient manner and the reasons for a conclusion based on certain visible evidence, properly placed before the court. In other words, the value of expert evidence depends largely on the cogency of reasons on which it is based.

3.13.2 Court Appearance[35]

When an expert is summoned it is not incumbent that he himself should appear. Any officer who is working with him conversant with the facts of the case and can satisfactorily depose in court can be deputed on his behalf. In the instant case the appellate judge wrongly refused to act upon reports and evidence of the chemical examiner on the ground that he did not himself conduct the analysis *Mangaldas Raghavji Ruparel v State of Maharashtra*, AIR 1966 SC 128 : (1965) 2 SCWR 581 : 1966 Cr LJ 106 (SC), *Relied on.*

3.13.3 Data necessary[36]

In the case of *Ramkaran Singh v Emperor,*[37] it was held that no doubt excise inspector was an expert in his own department and was able to distinguish liquors but the court should under section 51 ascertain the grounds on which his opinion was based so as to test it.

In this case the conviction was based on the bald statement of the excise inspector that the stuff which was recovered from the possession of the accused was illicit liquor but no data was furnished for the opinion. It was held that there was no adequate proof that the liquor was illicit.

The conviction was therefore set aside.

In *Mst Titli v Alfred Robert Jones:*[38]

> it was held that the opinion of an expert by itself may be relevant but would carry little weight with a court unless it was supported by a clear statement of what he noticed and on what he based his opinion. It was further held that the expert should, if he wanted his opinion to be accepted, put before the court all the materials which induced him to come to a conclusion so that the court although not expert might form its own judgment on those materials.

In view of the above decisions I am of the opinion that the bald statement of the excise inspector without examining the contents that it was illicit liquor, is not sufficient to prove the fact.

3.13.4 Test Cartridge not produced[39]

So far as the pellets are concerned, the results arrived at by the firearms expert do not appear to be conclusive.

They only seem to bear the impress of a mere probability, though with regard to the pin strike and finer striations on the base or the cap of the cartridge the opinion expressed seems to be definite and conclusive. But, unfortunately, he has not produced the test cartridge for comparison purposes. The learned advocate on that account has argued that unless the data be supplied or the enlarged photos be produced so that the opinion of the expert may be verified

35. Re *State of Kerala,* 1978 Cr LJ (NOC) 73.
36. *Gobardhan v State of Uttar Pradesh*, AIR 1959 All 53 : 1956 All WR (HC) 216 : 1959 Cr LJ 13 (All).
37. *Ramkaran Singh v Emperor,* AIR 1935 Ngp 13 : (1935) 36 Cr LJ 511.
38. *Mst Titli v Alfred Robert Jones,* AIR 1934 All 273.
39. Re *Kodur Thimma Reddi,* AIR 1957 AP 758 : (1957) 2 Andh WR 156 : 1957 Cr LJ 1091 (AP).

by the court, the court ought not to accept the opinion of the expert without satisfying itself of the correctness of the same.

3.13.5 Data/evidence about Sanity/Insanity Essential[40]

Dr. Roy's evidence is, to my mind, useless, and so far as I am concerned, it is suspicious from the start. His anxiety to be examined as a court witness and not as one for the defence, which he in fact was, at once indicates his bias or high anxiety to pose as a disinterested scientist.

That apart, a medical witness who considers it unnecessary to examine a person, however sane at the moment, for suspected lunacy, is not of much value. In this case Dr. Roy has attempted to substitute his judgment for that of the court. The question whether in the given circumstances a man was sane or insane is for the court to decide. An expert can only furnish a court with data from which insanity can be inferred. It is beside the point whether in the opinion of the doctor the man was medically insane. Even that would be a dangerous conclusion on the slender data on which Dr. Roy proceeded; but, however, that maybe, what we have to decide is whether the man was legally insane and there, at bottom, the question is a simple and common sense one which ordinary Jurors can easily comprehend.

3.13.6 Admissibility of Opinion on Data[41]

When an expert is to depose on a particular point, it is the duty of the expert to state in clear terms the basis or foundation or the data on which he concludes his findings. The court is competent to consider his opinion along with the data and has definitely a jurisdiction to consider as to whether the conclusion or the opinion should be accepted or not.

3.13.7 Language of Expert[42]

The criticism that the expert lives in and speaks from an impregnable fortress hardly holds good today. Experts are always ready to explain the reasons for their opinions; and judges are entitled to attach little or no importance to their evidence if the explanations given are not satisfying.

3.13.8 Expert's Language[43]

I do not minimize the value of expert evidence in these cases (of alleged insanity) but I deprecate the attempt to cloud a simple issue in a deluge of scientific words which no ordinary man would be able to understand. Even though cases of this type are tried without a jury in this province, the law is grounded on the assumption that the issue are ones which "twelve good men and true" can comprehend and answer.

3.13.9 Expert Reports[44]

It is next urged by the petitioner's counsel that the Exhibit P-5 the chemical examiner's report, does not contain any data or particulars which are necessary to help the court in accepting the opinion; it merely states that the bottle contained alcoholic content 21.912%. v/v at 60°F.

---

40. *Baswantrao Bajirao v Emperor*, AIR 1949 Ngp 66 : 1950 Cr LJ 181 (Ngp).
41. *Suriya Kanta Sarkar v State of Assam*, 1977 Cr LJ 268.
42. Re *SA Sattar Khan*, AIR 1939 Mad 283 : 40 Cr LJ 483 : 1938 Mad WN 962.
43. *Baswantrao Bajirao v Emperor*, AIR 1949 Ngp 66 : 1950 Cr LJ 181 (Ngp).
44. *Mahadevayya Veerabhadrayya Hiremath v State of Mysore,* AIR 1966 Mys 75 : 1966 Cr LJ 270.
    Also see *State of Himachal Pradesh v Shiv Devi*, AIR 1959 HP 3 : 1959 Cr LJ 448; *Suleman Usman Memon v State of Gujarat*, (1961) 2 Cr LJ 78.

The petitioner has relied on *Prabhu Babaji Navle v State of Bombay.*[45] In that decision their Lordships have held that it is chemical examiner's duty to indicate the number and extent of bloodstains found on the clothes sent to him for examination. In my opinion, this decision is not of any assistance to the petitioner. That was a case of bloodstains found on the clothes of the accused person and not a case concerning the report sent by the chemical examiner of the analysis of the percentage of alcohol contained in the article sent to him for examination. Further it may be noted that their Lordships did not say that because of the defects pointed out by them, the chemical examiner's report not given a detailed description is inadmissible. In *Suleman Usman Memon v State of Gujarat*[46] it has been held that the report of the chemical examiner must show the tests or experiments performed by him, the factual data revealed by such tests or experiments and the results leading to the formation of the opinion from such factual data; otherwise, the report would have no value as a piece of evidence.

This judgment of a single judge has not been approved by a Bench decision in *State of Maharashtra v Ramsingh Desasingh,*[47] Chainani, CJ, speaking for the Bench has stated:

> *The court cannot refuse to consider the evidence furnished by a certificate of the chemical examiner or assistant chemical examiner issued under section 129A of the Bombay Prohibition Act, 1949, merely because it does not mention the data on the basis of which the chemical examiner arrived at the percentage of alcohol mentioned in his certificate, or because he has not given the reasons for his conclusion. If the court feels that it should have more information in order to satisfy itself about the correctness or otherwise of the certificate, the court should summon the chemical analyser or ask the prosecution to summon and examine him. But without examining the chemical analyser, the court would not be justified in holding that the charge against the accused has not been proved, merely because the certificate issued by the chemical analyser only mentions the percentage of alcohol found in the blood of the accused and does not give any other particulars.*

With regard to the question of delay in the examination of the bottle, this is not a question of law which could be agitated before this court in a revision petition. The offence was committed on 14 July 1962 and the bottle was immediately seized and sealed in the presence of *panchas*. The same was sent to the chemical examiner on 27 July 1962. The fact that the report of the chemical examiner was received long after this, does not in any way affect the value of the report of the chemical examiner.

3.13.10 Reports Admissible[48]

Learned Counsel for the respondent has taken this technical objection that none from the office of the Chemical Examiner came forward to depose or file an affidavit to show that the sample of opium had not been tampered with during the period it remained with the Chemical Examiner. The respondent did not take a positive stand at the stage of the recording of the evidence that there had been any interpolation in the office of the Chemical Examiner in relation to the sample which was examined. It was only urged at the stage of the hearing of the arguments that it was the duty of the prosecution to show by leading some kind of evidence that the sample of opium had not been tampered with in the office of the Chemical Examiner. The trial court took into consideration this fact that no official of the Chemical Examiner was interested in tampering with the sample and that all official acts done by a public servant in the discharge of his duties could be presumed to be validly done. It was mentioned by Constable Gurnam Singh P.W. 3 in his affidavit that he had left the sample of opium in the office of

46. *Suleman Usman Memon v State of Gujarat*, AIR 1961 Guj 120 : (1961) 2 Cr LJ 78 (Guj).
47. *State of Maharashtra v Ramsingh Desasingh,* AIR 1963 Bom 68 : ILR 1962 Bom 493 : (1963) 1 Cr LJ 567.
48. *State of Punjab v Nachhattar Singh*, 1982 Cr LJ 1197.

the Chemical Examiner. The learned Counsel for the respondent laid stress on this point that it should have been entrusted to the Chemical Examiner himself. The trial court took into consideration this fact that it was not possible for the Chemical Examiner to personally receive the samples sent to him in all types of cases.

In the report, exhibit PE, of the Chemical Examiner it was specifically mentioned that the seal on the exhibit was intact and agreed with the sample seal sent. That means that up to the time the sample was examined there had been no interference in the same. The argument of the learned counsel for the respondent before us is that the report of the Chemical Examiner is admissible only for showing the sample to be one of opium and that any further observation made by him with regard to the condition of the sample at the time of the examination cannot be received in evidence under the provisions of section 293 Cr PC. The learned counsel has obtained support for his argument from a Single Bench ruling of this court,[49] wherein the scope of section 510 of the old Code of Criminal Procedure which corresponds to section 293 of the new Code was considered. The following quotation from the head note itself would clarify the view taken in that case:

> Held, *that according to the provisions of section 510, Cr PC., it is only the report of the Chemical Examiner upon any matter or thing duly submitted to him for examination, that can be used as evidence. In other words, it is the report by which is implied the opinion of the Chemical Examiner, which can be used as evidence provided the matter or thing, in respect of which such opinion is sought has been duly submitted to him for examination. In the context, the word "report" refers to the report proper pertaining to the examination of the matter or thing forwarded to him and not to any incidental intimation noted or endorsed in that report. section 510, Cr PC. dispenses with the necessity of production of Chemical Examiner as a witness in court to prove the contents of his report pertaining to the examination. It does not dispense with necessity of proof of any other incidental or consequential matter, about which a note has been appended in that report.*

We respectfully differ from the above view. Section 293 of the Cr PC. lays down that any document purporting to be a report under the hand of a Government scientific expert to whom this section applies, upon any matter or thing duly submitted to him for examination or analysis and report in the course of any proceeding under this Code, may be used as evidence in any inquiry, trial or other proceeding under this Code. The use of the word 'document' can lead to this inference that not only the opinion of the Chemical Examiner but all that is stated in the report becomes admissible without formal proof. If this were not so, such practical difficulties would arise as would render the examination of the Chemical Examiner or somebody from his office a dire necessity, and not only the position of the seal but even reference numbers of the communications received from the police would have to be proved by examining some witness so as to connect the material examined with the one sent for examination. The view taken in *Santa Singh's* case (*supra*) is, therefore, overruled.

Several Single Bench rulings of this court were then referred to by the learned Counsel for the respondent for showing that it was imperative for the prosecution to lead evidence about the non-tampering of the sample in case it had been entrusted by the police authorities to some functionary other than Chemical Examiner himself. The particulars of these rulings are as follows: —

(1) *Tehal Singh v State of Punjab*[50] decided by Tewatia, J on 20 November 1980.

(2) *Gurcharan Singh v State of Punjab*[51] decided on 5 February 1981, by Tewatia, J.

49. *Santa Singh v State*, (1970) 72 Punj LR 618.
50. Cri Rev No. 219 of 1979.
51. Cri Rev No. 304 of 1979.

(3) *Amarjit Singh v State of Punjab*,[52] decided by Punchi, J.

(4) *Atma Singh v State of Punjab*[53] decided by Punchi. J.

(5) *Bishan v State of Punjab*[54] decided by Dewan, J.

The ratio in *State of Rajasthan v Daulat Ram,*[55] was taken into consideration for giving this finding that unless somebody from the office of the Chemical Examiner filed an affidavit showing that the sample of an article remained in the same state as it had been handed over by the police till its actual examination, the link evidence would not be taken to be complete. In that case samples of opium were taken from the Excise Headquarters and were then handed over to a Sub-Inspector of a certain police station. Thereafter another witness had handed over the samples to the Superintendent of Police, Jodhpur, for onward transmission to the Public Analyst, but the samples were not accepted by the office of the Superintendent of Police as the labels were not in order. Then follows the following (Para 1): —

> It is the admitted case of the prosecution that the samples changed several hands before reaching the public Analyst. In other words, the samples remained in the custody of SI Aidanram, PS Udai Mandir, Nathu Singh, Gujraj Singh, Jawan Singh and the Assistant Public Analyst and yet none of these witnesses were examined by the prosecution to prove that while in their custody the seals were not tampered with. The inevitable effect of this omission is that the prosecution failed to rule out the possibility of the sample being changed or tampered with during this period—fact which had to be proved affirmatively by the prosecution. This is the main infirmity which has been relied upon by the High Court in holding that the prosecution has not proved that right from the stage of the seizure of the opium up to the time when the samples were handed over to the Public Analyst the seals remained intact.

Thus, the dictum in *Daulat Ram's* case enjoins upon the prosecution to prove this fact that up to the stage the sample reaches the Public Analyst the police not tampered with the same – so to substitute the article which was contained in the original sample. The seal used by the police is ordinarily handed over to a person of their choice and hence, it is not difficult for them to obtain back the seal and use it over again. The courts, therefore, always insist that somebody should come forward to depose that there has been no tampering of the seal until the sample gets out of the reach of the police authorities. We are of the view that the ratio of *Daulat Ram's* case cannot by analogy be applied to the employees working in the office of the Chemical Examiner. Those employees are not at all interested in the success of the prosecution case. It could only be the person who has been prosecuted for the recovery of some incriminating article who would be interested in the substitution of any material that was to be examined. Any mischief on the part of such a person would be sufficiently guarded against by obtaining this report of the Chemical Examiner that the seals were intact till the contents of the sample had been examined by him. If the courts were to insist that in every case all those persons who handled the sample in the office of the Chemical Examiner should depose about this fact that the sample had not been tampered with till it was opened for examination, it would very nearly render nugatory the beneficial provisions contained in section 293 of the Cr PC. The insistence upon obtaining depositions of the employees of the Chemical Examiner's office would prolong trials without any useful purpose being served. As pointed out by the trial court, it would not be possible to entrust all the samples to the Chemical Examiner himself for keeping them in safe custody till their examination. We are thus against extending the ratio of *Daulat Ram's* case beyond its actual scope. The report of the Chemical Examiner to this

52. 1981 Chand Cr Cas 170 (P&H).
53. 1981 Chand Cr Cas 181 (P&H).
54. 1981 Chand Cri C 243 : 1982 Cr LJ (NOC) 22.
55. AIR 1980 SC 1314 : (1980) 3 SCC 303 : 1980 Cr LJ 929.

effect that the seals on the sample were intact when it was examined by him is considered by us to be a sufficient safeguard against any mischief that could be perpetrated in the office of the Chemical Examiner.[1]

3.13.11 Insufficient Evidence[56]

The next question which is in the context of these discoveries arises is whether in the circumstances of this case Kanhiya can be held guilty for the murder of Smt. Dhooli and her son Shyoji? The investigating agency could not discover the *corpus delicti* nor is there any evidence on the record to show that both Smt. Dhooli and her son Shyoji dies between 6th and 9 March 1972. The prosecution did not take care to bring on record any fact that the bones and pieces of clothes seized near the river either belonged to or could be that of Smt. Dhooli and her son Shyoji. In the absence of any material on record it is difficult to hold that Smt. Dhooli and Shyoji have died. In the view of the matter the charge under section 302, IPC for committing murder of Smt. Dhooli and Shyoji cannot be sustained.

3.13.12 No Identification marks[57]

Certain gold biscuits were seized from an accused. A goldsmith tested the biscuits and certified that they were of 24 carats purity. He was, however, unable to assert by way of identification marks, seal, that the biscuits tested by him were the same which were seized from the accused.

Held, the prosecution failed to establish that the biscuits seized from the accused were of gold so as to attract the provisions of section 123 of the Customs Act and section 85(iii) of the Gold (Control) Act.[3]

3.13.13 Prosecution Failure[58]

It seems to us that the evidence which has been adduced falls short of proof in regard to a very material part of the prosecution case. In a case where death is due to injuries or wounds caused by a lethal weapon, it has always been considered to be the duty of the prosecution to prove by expert evidence that it was likely or at least possible for the injuries to have been caused with the alleged weapon. It is elementary that where the prosecution has a definite or positive case, it must prove the whole of the case.[4]

3.13.14 Nature of weapon Uncertain[59]

It is no doubt true that the medical evidence is that such wounds could be caused by an axe and knife. But it is unfortunate that no question has been put to the expert as to whether the weapons exhibited in the case as material objects could cause the wounds as found on the body of the deceased.

I am not prepared to believe that a clean and flawless truncation could be effected with the knife alleged to have been recovered from the appellant.

It is difficult to say with certainty or high probability that such wounds would be caused by an axe.

59. *Bhagoji v Hyderabad Govt,* AIR 1954 Hyd 196 : 1954 Cr LJ 1378 : ILR 1954 Hyd 130.

3.13.15 Prosecution Failure[60]

It was elicited, however, from the doctor in cross-examination that the fatal injury in question (on the neck) could have been caused by fist blows. After this statement it was incumbent upon the counsel for the prosecution, and, if he failed to do so, on the Sessions Judge, to question the doctor further as to whether it was possible for the fist blows to have caused strangulation. It is very unlikely that they should have, but as the point was not clarified, the matter is left in doubt. This is not the only circumstance showing the unsatisfactory nature of the trial before the Sessions Judge, for there was no question put to the doctor as to the number of fist blows which in his opinion could have caused the said fatal injury.

3.13.16 Counter-complaints[61]

In a complaint and counter-complaint such as this obviously arising out of the same transaction, when the prosecution proceeds on the basis of the complaint, we think, it is the duty of the prosecution to exhibit the counter-complaint through the police officer who recorded it and also to prove medical certificates of persons wounded on the opposite side also and place before the court a definite case which they ask it to accent.

3.13.17 Duties of the Defence[62]

Following with respect the decision reported I hold that the absence of data in Ex. P-5 does not make it inadmissible in evidence. It was open to the petitioner, if he wanted to have some more details or particulars about the report, to request the court to summon the chemical examiner for cross-examination. The petitioner has not done so and he cannot now contend that the report has no evidentiary value.

3.13.18 Failure of The Defence[63]

It was argued for the appellants that the pellet said to have been recovered by Dr. Singh from the injury No. 4 of Ram Singh had not been produced as a material exhibit and in the absence of such evidence it was doubtful if any pellet had really been extracted from his body. There is no doubt that the pellet was not produced by the doctor or by the prosecution in this case as a material exhibit. Dr. Singh was not asked about it, or he might have given some explanation as to what happened to it and whether he forwarded it to the police or not. In view of the fact the doctor or the prosecution witnesses were not cross-examined on this point and had no opportunity of explaining as to why it was not produced in the lower court, its mere non-production does not affect the case.

It was also argued that it was very unlikely that the pistol injury would have produced a four-sided or four-cornered wound and that, if really a pistol was used, then it would be expected that a round wound would be made because a pellet was round. There is nothing on record to show whether the pellet was round or square and whether it had four corners or not. If the doctor were cross-examined and were asked on this point, he might have been able to give some explanation as to how the four-sided or four-cornered wound was made by the pistol shot.

3.13.19 The Duties of Court[64]

We find that, although doctors who performed the post-mortem examination and who had admitted Hari Singh into the hospital, were examined at the trial, no question was put by either side to elucidate whether the contents of the small intestine and the large intestine could remain in that condition. The post-mortem examination took place at 2.40 pm on 13 December 1969, and the intestines were then found distended with gas. We do not know whether this could be their condition at 1 pm on 12 December 1969 or its effect. It is precisely questions of this kind which, even the prosecution or the defence counsel omits to put them, the trial court could and should have put to the doctors to clear up the position. If the trial court had failed to consider their importance, the High Court could have and should have taken further evidence on this matter under section 540 Code of Criminal Procedure. In a criminal case, the fate of (the proceeding cannot always be left entirely in the hands of the parties. The court has also a duty to see that essential questions are not so far as reasonably possible left unanswered. We are surprised to find, from the judgment of the High Court that the questions mentioned above, arising out of the post-mortem report, were not, for some reason, even mentioned there. We find it very difficult to believe that, in a case with a death sentence a matter of such significance, which was noticed by the trial court, was not raised at all by counsel for the appellants. In any event, it ought to have been dealt with by the High Court after taking appropriate additional expert medical evidence under section 540 read with section 428, Criminal Procedure Code if that was considered necessary before deciding it.[2]

3.13.20 Powers of Court[65]

As an illustration, it was pointed out that out of 825 questions put to one of the medical witnesses. Dr. IB Majumdar, no less than 574 had been asked by the learned judge himself. The complaint was not limited to the number of the questions asked, but concerned also the stage at which they were interposed and the form in which they were put. It was contended that, quite frequently, the learned judge took a witness out of the hands of not only counsel for the defence but also counsel for the prosecution and pressed them with a series of questions to give the answer he wanted, and as regards the cross-examination, he destroyed its effect by intervening whenever any answer favourable to the defence was given and putting a series of suggestive questions to the witness till he retrieved himself and gave an answer favourable to the prosecution.

It was further contended that in so interrogating witnesses on his own account, the learned judge often introduced new matters and at times brought on record evidence which was wholly inadmissible, and he completed the error of procedure by denying to the defence an opportunity for further cross-examination. The objection taken was a serious one. If unfounded, it was improper objection to take; but if well-founded, the effect of the irregularity must be seriously considered.

The right of a judge to put questions to witnesses is given to him by section 165, Evidence Act. The section says that he may "in order to discover or to obtain proper proof of relevant facts, ask any question he pleases, in any form, at any time, of any witness, or of the parties about any fact relevant or irrelevant." The rest of the section and the provisos thereto are not material here.

It is obvious that the judge contemplated by the section is not a mere umpire at a wit-combat between the lawyers for the parties whose only duty is to enforce the rules of the

64. *Raghunandan v State of Uttar Pradesh,* AIR 1974 SC 463 : (1974) 4 SCC 186 : 1974 Cr LJ 453 (SC).
65. *Sunil Chandra Roy v state of West Bengal*, AIR 1954 Cal 305.

game and declare at the end of the combat who has won and who has lost. He is expected and indeed it is his duty to explore all avenues open to him in order to discover the truth and, to that end, question witness on points which the lawyers for the parties have either overlooked or left obscure or wilfully avoided. It has been said that it is particularly necessary that the judge should exercise this power in a jury trial, because it is his duty to aid the jury in obtaining a proper comprehension of the facts which they, as laymen, can do only if the facts are laid bare, with the implications not left as such but fully brought out and with the false suggestions eliminated. If, therefore, the judge finds that the examination of a witness is not being conducted in such a way as to unfold the truth, it is not only his right but his duty to intervene with his own questions, particularly at a jury trial.

But while theoretically the powers of the judges are limitless and unfettered, certain principles have come to be recognised which he must follow as to the manner in which he exercises the power. It need hardly be pointed out that he must not take a side; he must not also forsake the judicial calm for the zeal of a combatant.

Again, although the law allows the judge to put any question at any time, the time generally considered proper for an extended examination is when the lawyers for the parties have finished their questions or at least when the lawyer, examining the witness at the time, is passing on to a new subject. The judge may always intervene, in the course of examination by counsel, to put a question in a clearer form or to have an obscure answer clarified or to prevent a witness being unfairly misled, but if he does more and stops counsel again and again to put a long series of his own questions, he makes an effective examination or cross-examination impossible and diverts the trial from its natural course.

Having read the entire transcript of the evidence several times over in the light of the above principles, I am of opinion that no just exception can be taken as a whole, nor except in a very few instances, to their nature, but unfortunately, the time chosen by him for his interventions and the numbers of questions asked at a time, did at times have the effect of interfering unduly with both the examination-in-chief and the cross-examination and of putting the witness at an advantage or disadvantage.

As to the number of the questions asked, the learned standing counsel supplied us with a chart, the correctness of which was not disputed. According to it, the learned judge's questions, in the case of Nirmal, 139 against a total of 845, in the case of Mrs. Sati Mitra 35 against 284, in the case of Mr. Mahanti 21 against 171, in the case of Dr. Mahanti 28 against 147 in the case of Panchu Gopal Das 18 against 210, in the case of Jiban Krishna Das 10 against 165, in the case of Dr. Bose 8 against 81, in the case of Purnananda Sethi 17 against 195, in the case of Dr. IB Majumdar 574 against 825, in the case of Dr. Kabir Hossain 180 against 423 and in the case of Puspa Pal 132 against 817.

These were all the material witnesses and except in the case of Dr. Majumdar and Dr. Hossain, it can by no means be said that the number of questions put by the learned judge were usually or inordinately large. The reasons why the learned judge found it necessary to question the two medical witnesses extensively have been given by him in an order recorded on 13 June 1952 where he has himself stated correctly the permissible limits of judicial interrogation. The reasons are fully borne out by the record. It appears that in the case of Dr. Majumdar, the learned judge intervened before the cross-examination was over because the learned cross-examining counsel wanted break and in the case of Dr. Hossain, he did so before the cross-examination started, because the learned counsel asked for time till the next day. Rather than rising, the learned judge utilised the time in hand by putting to the witnesses questions of his own and it appears from the minutes that in the case of Dr. Hossain, he did so after ascertaining that the learned counsel had no objection. In these circumstances, it cannot at all be fair to charge the

learned judge with having interrupted the cross-examination, so far as those two witnesses are concerned. Nor can an exception be taken to the number of questions asked.

There is no limit to the questions which the judge may put and if he considers, as the learned judge did in this case that he has not yet got to the bottom of the matter or that the witness has not yet made his full meaning clear, there is no reason why he should not go on with the examination, whatever the number of the questions required to achieve the purpose of eliciting the truth.

Dr. Majumdar, in particular, was an exceptional witness in many ways. His delay in sending the viscera for chemical and pathological examination, the fact that he removed the pathological report and at least one other paper from the records of his office on the eve of his retirement and kept them with himself at his house for two months till his own examination before the committing magistrate, his claim that he had removed the papers on granting a receipt to his successor which the successor denied and the way in which, after deposing during his examination-in-chief to an effect which did not militate against the prosecution case, he conceded various suggestions in the opposite sense made to him during the cross-examination on the basis of theories, clearly provoked a close and comprehensive examination of his answers.

In my opinion, no fault can be found with the learned judge that he undertook such an examination. It appears further that the bulk of the questions put by the learned judge to these two witnesses were after their cross-examination had been concluded. It is true that both were recalled and then also the learned judge put some further questions, but whether or not the defence was given proper opportunities for further cross-examination is a separate matter which I shall deal with under another head. So far as the number of the questions put to these two witnesses is concerned and the points of time at which they were put, I do not think there is any just ground for complaint.

There is another reason which I think, no mistrial can be made out from the manner in which the learned judge interrogated the medical witnesses. The conception of the function of medical evidence on which the two doctor witnesses were cross-examined, appears to me to have been entirely mistaken and even if some over-interrogation by the learned judge took place on irrelevant matters introduced by the defence itself, such over-interrogation cannot be said to have affected the merits of the trial.[1]

3.13.21 Strictures[66]

1. It is abundantly clear that a trial court is expected to give only such remarks which are necessary to sustain a judicial finding. In other words, only such remarks need be made in the judgment which are in furtherance of the ends of justice and not to fulfil any other object except deciding the case in a correct perspective so that appropriate finding is given. It is undisputed that the remarks should be borne out from evidence and must not be pure surmises and conjectures made by the court. If the intention is to harm any public servant, or even if that intention is missing but the remarks made are reckless and are likely to jeopardise the interest of public service and endanger the prospect of a public servant and even injure his reputation or harm his official career, such remarks require to be expunged as they are no longer necessary. In other words, the remarks made by the trial judge should be *bona fide* and should be directed only to one and the only end, namely, the dispensation of justice in trial.

66. *ML Ahuja v State of Himachal Pradesh,* 1975 Cr LJ 330 : ILR 1975 HP 852.
Also see: *Raghubir Saran v State of Bihar*, AIR 1964 SC 1 : (1964) 1 Cr LJ 1 : 1963 BLJR 951; *SN Vyas v State of Rajasthan,* AIR 1966 Raj 164 : 1966 Cr LJ 798 : (1966) 16 ILR 81 (Raj); *State of Uttar Pradesh v Mohoammad Narain,* AIR 1964 SC 703 : (1964) 2 SCR 363 : (1964) 1 Cr LJ 549; *Jage Ram v Hans Raj Midha*, AIR 1972 SC 1140 : (1972) 1 SCC 181 : 1972 Cr LJ 768; *State v Amar Singh*, 1972 Cr LJ 1578 : (1972) 2 Sim LJ (HP) 287.

Nevertheless, the learned Sessions Judge has made certain sweeping remarks which, in our opinion, were not called for and must be expunged.

3.13.22 Fair Criticism of Courts[67]

Again in *Ambard v Attorney-General for Trinidad and Tobago*, 1936 AC 392 the law enunciated in (1900) 2 QB : 36 by Lord Russell of Killowen was applied and it was said at p 335:

> *But whether the authority and position of an individual judge, or the due administration of justice, is concerned no wrong is committed by any member of the public who exercise the ordinary right of criticising, in good faith, in private or public, the public act done in the seat of justice. The path of criticism is a public way; the wrong-headed are permitted to err therein; provided that members of the public abstain from imputing improper motives to those taking part in the administration of justice, and are genuinely exercising a right of criticism, and not acting in malice or attempting to impair the administration of justice, they are immune. Justice is not a cloistered virtue; she must be allowed to suffer the scrutiny and respectful, even though outspoken, comments of ordinary men.*

Lord Denning, MR, in *Reg v Commr of Police of the Metropolis, Ex-parte Balakbum (No. 2)* (1908) 2 WLR 1204 made some pertinent observations about the right of every man, in Parliament or out of it, in the Press or over the broadcast, to make fair and even outspoken comment, on matters of public interest. In the words of the Master of Rolls:

> *Those who comment can deal faithfully with all that is done in a court of justice. They can say that we are mistaken, and our decisions erroneous, whether they are subject to appeal or not. All we would ask is that those who criticise us will remember that, from the nature of our office, we cannot reply their criticism. We cannot enter into public controversy. Still less into political controversy. We must rely on our conduct itself to be its own vindication.*

The decision *Re The Editor, Printer and Publisher of "The Times of India,"* is very opposite and may be next referred to. In a leading article in *"The Times of India"* on the judgment of this court in *Aswini Kumar Ghose v Arabinda Bose*, AIR 1952 SC 369 : (1953) SCR 1 : 1952 SCJ 568, the burden was that if in a singularly oblique and infelicitous manner the Supreme Court had by a majority decision tolled the knell of the much maligned dual system prevailing in the Calcutta and Bombay High Courts by holding that the right to practise in any High Court conferred on advocates of the Supreme Court had made the rules in force in those High Courts requiring advocates appearing on the original side to be instructed by attorneys inapplicable to them. This is what was said by Mahajan, J, (as he then was) speaking for the court:

> *No objection could have been taken to the article had it merely preached to the courts of law the sermon of divine detachment. But when it proceeded to attribute improper motives to the judges, it not only transgressed the limits of fair and* bona fide *criticism but had a clear tendency to affect the dignity and prestige of this court. The article in question was thus a gross contempt of court. It is obvious that if an impression is created in the minds of the public that the judges in the highest court in the land act on extraneous considerations in deciding cases, the confidence of the whole community in the administration of justice is bound to be undermined and no greater mischief than that can possibly be imagined.*

The guiding principles to be followed by courts in contempt proceedings were enunciated in *Brahma Prakash Sharma v State of Uttar Pradesh*:[68]

> *It will be an injury to the public if it tends to create an apprehension in the minds of the people regarding the integrity, ability or fairness of the judge or to deter actual and prospective litigants from placing complete reliance upon the court's administration of justice, or if it is likely to cause embarrassment in the mind of the judge himself in the discharge of his judicial*

67. *Perspective Publications Pvt Ltd v State of Maharashtra,* AIR 1971 SC 221 : (1969) 2 SCR 779 : 1971 Cr LJ 268 (SC).
68. *Brahma Prakash Sharma v State of Uttar Pradesh,* AIR 1954 SC 10 : (1953) SCR 1169 : 1954 Cr LJ 238.

duties. It is well-established that it is not necessary to prove affirmatively that there has been an actual interference with the administration of justice by reason of such defamatory statement; it is enough if it is likely, or tend in any way, to interfere with the proper administration of law.

There can be no matter of doubt that in this country the principles which should govern cases of the present kind are now fully settled by the previous decisions of this court. We may restate the result of the discussion of the above cases on this head of contempt which is by no means exhaustive.

1. It will not be right to say that committals for contempt scandalizing the court have become obsolete.

2. The summary jurisdiction by way of contempt must be exercised with great care and caution and only when its exercise is necessary for the proper administration of law and justice.

3. It is open to anyone to express fair, reasonable and legitimate criticism of any act or conduct of judge in his judicial capacity or even to make a proper and fair comment on any decision given by him because "justice is not a cloistered virtue and she must be allowed to suffer the scrutiny and respectful, even though outspoken, comments of ordinary men."

4. A distinction must be made between a mere libel or defamation of a judge and what amounts to a contempt of the court.

The test in each case would be whether the impugned publication is a mere defamatory attack on the judge or whether it is calculated to interfere with the due course of justice or the proper administration of law by this court. It is only in the latter case that it will be punishable as contempt.

5. Alternatively, the test will be whether the wrong is done to the judge personally or it is done to the public. To borrow from the language of Mukherjee, J. (as he then was) in Brahma Prakash Sharma's case[1] *(supra) the publication of a disparaging statement will be an injury to the public if it tends to create an apprehension in the minds of the people regarding the integrity, ability or fairness of the judge or to deter actual and prospective litigants from placing complete reliance upon the court's administration of justice or if it is likely to cause embarrassment in the mind of the judge himself in the discharge of his judicial duties.*

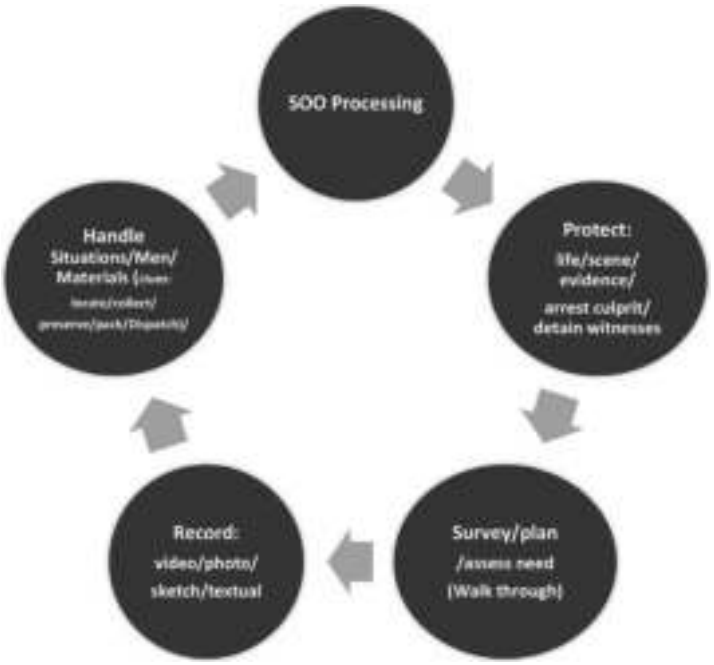

Fig. 4.1

4.1 IMPORTANCE (GENERAL)

The success or failure of criminal investigations starts and ends at the crime scene

A scene of occurrence is the place where an incident has occurred or a place where an incident-related material is found. The incident may be a crime, an accident or some other occurrence. We discuss mainly crime scene in the chapter.

The crime scene(s) may be a single site or multi-point sites. For example, in a case of kidnapping, the place from where the person has been kidnapped, the vehicle in which he had been moved, raped or killed, the places where he was hidden, the place where he has been murdered and the place where the *corpus delicti* is secreted are all essential elements of scene of crime. In short, a crime scene is a place where the crime took place and carries some exchanged or leftover evidence relating to the crime. It is the place that provides crime or standard evidentiary clues for comparison *inter se*.

A crime scene is any place that usually provides vital evidence to link the criminal with the crime. It may be a human body, a building, a vehicle, a water body, or an open space where incriminating objects are located.

The crime scene is the place where the persons involved in the crime (the culprit, the victim, their associate or witnesses) come across one another. They exchange traces *inter se* and with the scene, leave odds and ends, including marks of tools, wearing apparels, tires, hands, fingers, feet and other body parts. There is disturbance often at the scene, which helps to understand the sequence/pattern of events. Thus, the scene of occurrence provides a wealth of clue materials and other evidence that is useful to:

1. Establish *corpus delicti*.
2. Link the criminal, the victim and the scene of occurrence *inter se*.
3. Evaluate the pattern of events.
4. Indicate modus operandi/sequence of events.
5. Help reconstruction of the occurrence.
6. Find the fugitive criminal(s), the secreted victim and the hidden vital evidence.
7. Find the number and nature of the weapons.
8. Know the transport used.
9. Ascertain the routes of ingress and egress.

The crime scene is of great importance in almost all crimes. It may be less useful in cyber/computer crimes and in some document related problems.

The scene of occurrence changes with time. It cannot be preserved indefinitely. Besides, some of the evidence gets lost soon after the occurrence. Some other evidence contaminates or alters the original evidence with passage of time. The occurrence may be on a busy road. It cannot be closed for a long time. The crime scene examination, therefore, brooks no delay. It needs immediate processing.

The scene may be indoor or outdoor. It may be a room, a cellar or a roof. It may be a road or a roadside, an open field, a jungle, a hill or a mountain, a stream or a river pond. It may be a pond, a lake or seashore. It may be a vehicle: a car, a truck, a bus, a train, a boat, a ship or an aeroplane. Every scene of occurrence presents unique aspects for which the examination technique may need some modification.

The opportunity to examine the scene is available only once. If the same is not fully exploited the wealth of information about the crime is lost.

4.2 THE PROBLEMS/POSSIBILITIES

The examination of the scene of occurrence should help to answer the following questions:

1. Is the alleged scene of occurrence genuine or fake?
2. How did the criminal and the victim reach the scene?
3. What were the entrance and exit points?
4. How many criminals and victims were involved?
5. What was the *modus operandi?*
6. What evidence did the criminal and the victim exchange?
7. When was the crime committed?
8. Why did the victim/criminal behave in a particular way?
9. Who were the criminals or victims?
10. What did the criminal do after the commission of the crime?
11. Who did the criminal visit after the occurrence?
12. Could the behaviour of the criminal at the scene help to build his profile?
13. Could the language/dialect/accent indicate the region/area to which he belongs?

4.3 LOCATION

The scene of occurrence is identified/located from the following:

1. Presence of *Corpus delicti.*
2. Marks of struggle.
3. Accounts of eyewitnesses.
4. Abandoned articles and other clues including impressions/prints/body fluids/bloodstains. For example, a stain of ejaculated semen, once, established the site of rape.
5. Traces carried over from the scene. For example, once, the plant fragments on the clothes of a child indicated the place of assault.

It is not difficult to identify/locate the scene of occurrence, but sometimes criminals fake a scene to mislead the investigators, to avoid suspicion and try to pass on the guilt to others. Sometimes, natural phenomena may change the scene of occurrence. Water currents or fish may carry away the body. Carnivorous beasts may drag the corpse to jungles and to other open spaces. It is essential, therefore, to establish that the scene is genuine. It is the first step.

4.4 EVALUATION

Proper evaluation of the scene of occurrence is a time-consuming job. It involves the following:

1. Protection of the scene
2. Photography/video filming the scene
3. Sketching the scene
4. Searching the crime scene
5. Location/collection/preservation/packing the clues
6. Documentation of the crime scene
7. New tools and techniques in handling the crime scenes

4.4.1 Protection

The investigating officer cannot always reach the scene immediately after the occurrence. The first police officer who reaches the scene, therefore, should preserve the evidence. He should:

1. Check the injured for any signs of life. If there is even a remote chance of life, he provides medical help immediately. The injured is transported to the nearest hospital. The injured is handled with deliberation and caution to disturb the scene to the minimum extent possible. If the injured are already dead, the dead bodies should be moved after processing the scene.
2. Expel all unauthorised men like relatives and friends of the victim or of the culprit, onlookers, photographers and media persons from the scene. No one should be allowed to enter the scene. They should be handled carefully, politely, persuasively, yet firmly.
3. Barricade the scene of occurrence so that it remains unaltered. Enclose a larger area rather than a smaller one so that no possible clues are left outside the barricaded area.

4. Segregate the suspects and the witnesses, so that they do not discuss the case with one another.
5. Arrest the identified culprit. Detain suspects. If one tries to run away, arrest him.
6. Prevent even fellow police officers (including the senior officers) from entering the scene to satisfy their curiosity. Only the officer-in-charge of the case should determine when, why, and who is to enter the scene.
7. Desist starting independent searches and inquiries.
8. Assess the need for assistance of other police officers or specialists (photographers, draughtsman, experts from forensic science laboratories and medico-legal experts). They are called in at the earliest.
9. Seek help from home guards or other similar organisations to protect the scene, if necessary.
10. The superior officers are informed about the nature of crime and the help required, through telephone.
11. Remain on guard throughout until the IO takes over. The scene of occurrence is not left unguarded. Home guard personnel are available at most of the place, they should be sent for outside duties, if required.
12. Record the name of the informant with his address, the time when he gave the information and the alleged time of occurrence. Detain him to get additional details.
13. Refrain from discussing the case with anybody including suspects, complainants, victims, witnesses, onlookers or the pressmen.
14. Keep his ears and eyes open to listen to any passing remark or to observe the behaviour of the persons around.
15. Avoid introduction of any material like cigarette stubs, cigarette ash, foot or footwear marks or fingerprints at the scene.
16. Preserve the doors, windows, staircases, lighting, and routes of ingress or egress in their original condition until the investigator arrives.
17. Record the time of arrival, note and record the weather conditions and that of the crime scene.
18. Record the smell/odours/scent/stench at the scene or with the victim especially that of alcohol, tobacco, perfumes or explosives.
19. Refrain using the utilities like bathroom, washbasin, lavatory, towels, telephone which are part of the scene of occurrence.
20. Leave the various articles at the scene at their original from its place.
21. Refrain from cleaning/re-arranging the articles at the scene, even if the scene is in a mess.

Alteration of positions of objects may have to done in emergencies. Record the original/changes photographically. The first officer follows the Mantra in the textbox.

Fundamental Mantra for first police officer:
preserve the SOO: **"As is, as it was"**

4.4.2 Photography

Fig. 4.2
Modern Digital Camera (A 12 + Mega Pixel DSLR)
Results comparable with the best Film SLR

The scene of occurrence is photographed as a matter of routine. Digital photography has brought about a revolution in photographing a scene. It does not add materially to the cost of investigation and trial. Yet they help the courts and the counsels to understand the occurrence.

The photographs of the scene of occurrence are very useful:

1. It is rather rare for the judges, the jury and the lawyers to visit the scene of occurrence. Proper photographs of the scene bring the scene to the courtroom. They are better than verbal or written descriptions. A video film brings the scene of occurrence to the courtroom more vividly. It is highly informative.
2. The pressure of work may force an investigating officer to overlook certain details. Proper photographs (and a video film) of the scene make these details available to him even long after the occurrence.
3. The investigating officer is influenced sometimes, by the account of an interested person and examines the scene with a preconceived theory, even unconsciously. Later, certain facts lead to different conclusions. If a video film is available, it helps to verify the new version.
4. Sometimes, the eyes may not observe certain facts (for example, washed bloodstains and marks of disturbance at the scene). The cameraman will photograph them and keep a permanent record.

5. Skid marks, tire marks, foot and footwear marks are found on highways and busy roads. The marks are difficult to pick up. The road needs opening, to avoid serious dislocation of traffic, at the earliest. Photography is fairly effective and quick mode. It records the evidence immediately.
6. The photographs prove useful in determining the extent of responsibility in vehicular accident. They provide the needed proof.

   A minor traffic accident involved a bus and a truck. The bus operator sued the truck owner for damages in a civil suit. From the photographs of the scene of occurrence and of the damage to the truck and to the motor bus, taken at the time of occurrence, the extent of guilt of the parties involved could be established. (CH)
7. A video camera is very effective to cover all types of crime scene properly. It is indispensable in riot cases. It records the identities of the participants and the part played individually by them, such as shouting slogans, inciting people or damaging public or private property.

   During the murder of a President of the United States of America, while he was addressing a public meeting, a documentary video film was being made for the event. It also recorded the movement and action of the murderer. The film provided irrefutable evidence against the culprit. (CH)
8. The perishable evidence like wounds on a dead body, traces of resistance, scratches, tears, rents, swollen flesh in rape cases, and strangulation marks are best recorded and preserved through photographs.

   In a murder case, the injuries found on the dead body were small pellet holes surrounding a rat-hole. The prosecution alleged that the injuries were caused by a single gunshot from about 8 M. The defence challenged the version. They quoted books mentioned that separation of pellets starts from about 3 M. They also produced an "expert" who said that the description of injuries indicates that two shots were probably fired.

   If the theory of two shots were accepted, the accused would have been given the benefit of doubt as the witnesses had observed only one shot being fired by the accused.

   There were no photographs of the injuries. It was, therefore, difficult to visualize the exact nature of the injuries. However, the doctor who had carried out the post-mortem examination was available. He, on request, sketched the injuries from his memory and the available written description.

   The author test fires with the same gun and similar ammunition from the alleged distance. They created pellet patterns with a rat in the centre like the one sketched by the medico-legal expert. The pattern obtained on a filter paper sheet was submitted to the court. The demonstration convinced the court that the thesis of the prosecution that only one shot was fired was correct. (CH)

4.4.2.1 Camera

Digital imaging has ushered in a new era in photography—a real revolution. The camera functions like an ordinary camera but does not include a film. Instead, there is a memory card that records the pictures, stores them and permits recall of the snap for checking its quality soon after taking the snap. The images, thus, recorded can be transferred to a computer and processed there. Their prints are obtained through a computer printer.

The main advantages are:

1. High-resolution cameras give pictures of high quality compared to photographs taken with the conventional camera-film combo.
2. The cost of the pictures is substantially low.
3. Digital cameras were costly to start with. Now it is comparable with film cameras of corresponding quality.

4. Image processing, through computers, has made it cost/time effective.
5. Computer software for editing the images is extremely handy.
6. The digital camera has dispensed the need for frequent loading/unloading films. The memory card can record hundreds of images simultaneously. The memory cards have variable capacity to suit the need.
7. Digital photography does not need a photo studio for processing images to pictures. Computer is used to process the images.
8. Photography is possible even in inadequate light *vis-à-vis* film photography.
9. Wide-angle lens and telephoto lens are used in special situations in the same way as in film photography. The former covers closed areas like bathrooms and kitchens and the latter distant objects, like a dead body in a deep well adequately.
10. The main advantage of digital photography in a crime scene photography is that the quality of the images can be checked and imperfect snaps can be eliminated then and there with impunity.

Formerly a studio camera was used for the photography of scene of occurrence. It was bulky and, therefore, inconvenient to handle. A light and handy 35 mm quality reflex camera substituted the old one. With some accessories (wide-angle lens, telephoto lens, close-up attachment, flashgun, photoflood lamps, exposure meter and a collapsible stand), it could handle most of scenes adequately. A photographer kept a supply of high-quality films (black and white and colour) with varying speeds and contrasts to meet various situations. Now, a high-quality digital camera[1] is used. It meets the crime scene photographic demand adequately.

The only disadvantage of a camera is its small format, but it is easily compensated by the high-quality digital images. The ease of process and extensive manipulation has made film photography redundant and it is on its way to extinction.

4.4.2.2 Coverage

The investigating officer himself can photograph the scene. However, a professional police photographer is employed. In all cases, the investigating officer decides the coverage.

TIPS FOR CS PHOTOGRAPHER

1. Discuss and evaluate the needed coverage with the investigating officer
2. Use tripod for close-up photography.
3. Take photographs from outside of the CS or from the core (central focal point) of the scene, if OK.
4. Use digital camera. Record images liberally. They are less expensive.
5. Follow the photographic drill strictly:
   a. Connect the scene with the surroundings.
   b. Connect the evidence with the source/site.

1. *See* chapter 27 on Digital Images.

c. Photograph each piece of evidence twice from:
   - Distant range
   - Mid range
   - Close range: close-up view.

d. Check quality of each image there and then. Usually there is no second chance, once you leave the scene. Discard the defective, retake the image.

6. Keep spare camera, flash, batteries, for back up.
7. Maintain a photographic log for reference.
8. Ensure identity, integrity, authenticity and relevancy of the images by imaging identification data in the images, whenever possible.

The following principles promote better coverage:

1. At least four photographs are taken for the general view, four for the *corpus delicti* and at least two for each of the items of evidence discovered at the scene.
2. Close-up photographs are taken along with a scale to indicate dimensions of the items photographed.
3. A record of the items covered, positions of the camera, and type of illumination used, if any, is kept.

The items photographed are:

1. The main site of the scene of occurrence; it should include such item that can identify the location of the scene of occurrence.
2. The route of approach of the criminal.
3. The point of the entrance/exit.
4. The location of the *corpus delicti.*
5. The position and identity of the *corpus delicti.*
6. The evidence on the deceased (injuries, weapon, hair and fibres in his hands or on his person).
7. The marks of struggle including bloodstains, disturbed furniture, bedding and the like.
8. The evidence left by the criminal, like the weapon of offence, bullets, cartridge cases, cigarette stubs, items of wearing apparel, fingerprints, foot or footwear marks, bullet holes and marks and tool marks.
9. The place(s) from where the culprit could possibly pick up clue materials e.*g.,* paint, broken glass, fibres, mud.
10. The route of departure.

Fig. 4.3
Establishing the location of the scene

Fig. 4.4
Close up for identification

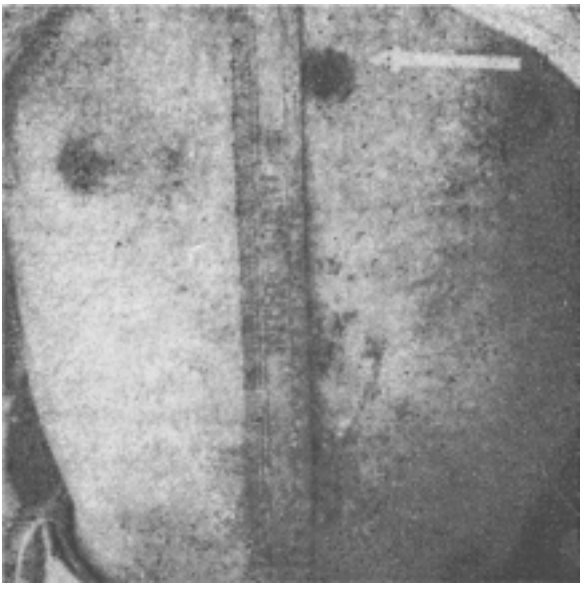

Fig. 4.5
Close up for the wound of entrance

Fig. 4.6
Exit wound close up – continuation of wound in Fig. 4.5

If some persons witnessed the occurrence, images from their viewing site are also taken. The images are useful to check and demonstrate the veracity of the witnesses.

4.4.2.3 Photographic Exhibits

The following points are kept in mind when the exhibits of images are prepared for presentation on the court:

1. The number of photographs/images from the scene of occurrence which are produced as exhibits in the court, should not be large. A large number may distract/confuse the court. The images are properly arranged and produced at appropriate times.
2. The photographs should be free from distortions, glares and shadows. They should have the proper perspective and tonal relation.
3. It is convenient to produce 10 × 15 cm to 20 × 30 cm photographs. They are easy to view and handle.

Fig. 4.7

General view of the scene

Fig. 4.8

Position of the dead body

4.4.3 Recent Advances in Imaging/ Photography of the Scene

Tremendous innovations have taken place in handling the scene of occurrence, including the following:

4.4.3.1 Aerial photography

Aerial photography has been used to photograph the expansive outdoor scene of occurrence. It allows better appreciation of the position of the objects involved in the crime. It is indispensable where large areas are involved. Air, ship and train disasters are best covered by aerial photography. Police departments are acquiring drones to handle crime scenes.

4.4.3.2 Colour photography

Colour photography is used routinely. It is useful in photographing injuries and discoloration of body skin especially in rape and other offences against person. It is also useful to demonstrate the colour difference in some other forms of evidence. Colour photography is being used routinely by all police forces as the colour photography has become cheap. Digital cameras record objects in their natural colours.

4.4.3.3 Video filming

Video cameras are fairly inexpensive in modern times. A properly educated investigation officer would use video filming in all important cases. In some scenes, it is indispensable. For example:

- Rioting,
- Detection of insurance frauds (feigning grievous hurt),
- Detection of sale/purchase of narcotics,
- Betting and gambling offences, and
- Driving under the influence of alcohol.

The use of video filming, to cover the scenes of crime, in our country is limited. However, it has great potential to record the crime scenes. The obvious advantages are:

- The cost of the video film is low.
- The pictures obtained are of high quality.
- Large areas can be covered.
- The results can be verified immediately.
- It is an excellent substitute for cinematography to record actions and movements (rioters!).

The main disadvantages are, though individual snaps can be obtained, yet it is not common. Usually the film itself is projected and shown. The courts may not find the same convenient. Video filming, however, has a great future. It will play its rightful role in covering the crime scenes.

4.4.3.4 The use of markers

Markers like flags or circles made with a chalk piece to indicate the position of small items provide better coverage of the evidentiary clues. Ordinarily, two photographs, one before and one after putting the mark are taken for each item.

4.4.3.5 Photogrammetry

It was being used increasingly in some countries to photograph the scene of occurrence. The main advantage of the technique was that it dispenses with the measurement of inter-distances and preparation of sketches. The photograph provides the necessary data on further processing. Its cumbersome nature has not made it popular. It is not used in India.

4.4.4 Sketching

Sketches are handy in depicting important evidence at the scene of occurrence. In combination with the photographs, the sketches provide an ideal presentation of the scene.

1. They indicate the basic set up of the crime scene.
2. They indicate inter-distances and position of the relevant evidentiary clues only.

The police requires the services of revenue officials (or a draughtsman) in all important cases to draw sketches or of a draftsman to sketch the scenes of occurrence. They have the necessary training and experience in preparing plans and drawings of the type required in police work. They are available even in rural areas.

The revenue official should draw the general outline of the scene in black ink and the investigating officer should fill in (or get filled in) details of the evidence observed in red ink. A carefully and conscientiously prepared sketch in this way is a useful piece of evidence.

The following aspects are kept in view while sketching the scene:

1. The sketch of the scene is prepared at the site and not in the office/residence of the investigating officer.
2. The distance is measured with a tape and not by paces, or guessed.
3. A suitable scale is fixed and indicated on the sketch. The following scales are suitable:
   - For indoor scene: **1: 5 to 100.**
   - For building/outdoor **1: 50 to 500.**
   - For large areas: **1: 1000 to 10,000.**

4. The direction is determined using a compass. An arrowhead is put to indicate **NORTH.**
5. Non-involved entities are not indicated (introduced) in the sketch.
6. Symbols, letters or digits, and a legend are used to avoid crowding.
7. Sketching need some simple equipment: a measuring tape, a drawing board, a ruler, a set of triangles, graph, drawing paper, pencils and an eraser, ordinarily, meet the requirements.

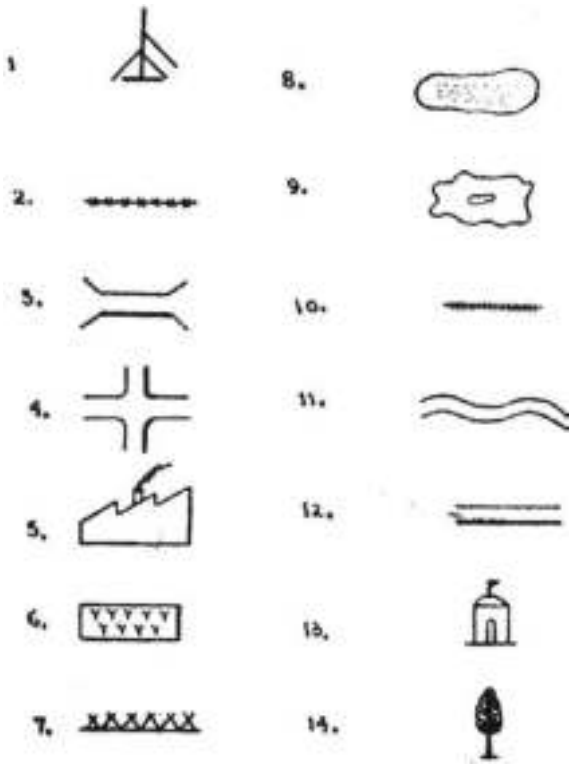

Fig. 4.9

Conventional Symbols

"1. Wireless Aerial, 2. Boundary, 3. Bridge, 4. Crossing, 5. Factory, 6. Fields, 7. Hedge, 8. Pasture, 9. Pond, 10. Rail Line, 11. River, 12. Road, 13. Temple, 14. Tree."

There are various methods of drawing sketches. The following are common:

4.4.5 Coordinate method

The coordinate technique is mostly used. A focal point is chosen and two lines crossing each other at a right angle are drawn. One line (x) represents the length and the other (y) the width of the scene to be covered. The locations of the clue objects are then filled in the outline diagram after determining the coordinates (position/distances from the focal point).

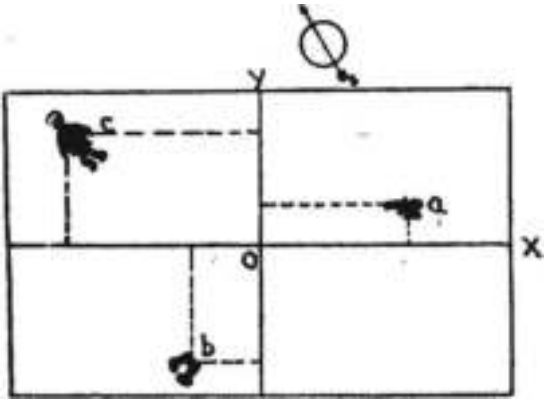

Fig. 4.10

Coordinate method

Scale 1: 50

Legend: (a) Weapon, (b) Shoes, (c) A body

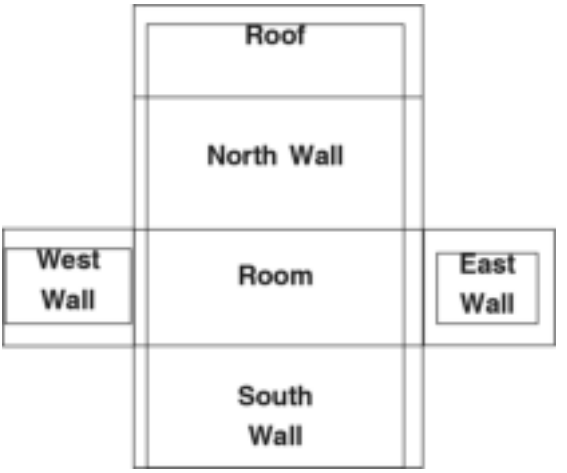

Fig. 4.11

Extended coordinate Method

4.4.6 Polar technique

It is used for expansive outdoor scenes. Here instead of drawing co-ordinates, the distances and directions of the evidentiary objects are noted with reference to a central (focal) point. The positions are recorded on the sketch accordingly.

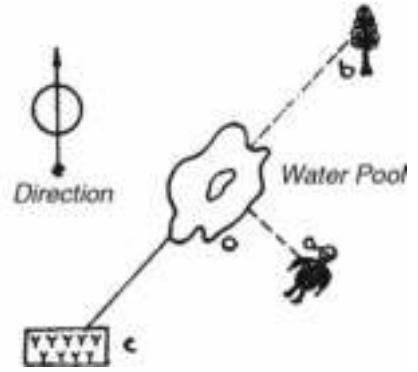

Fig. 4.12

Polar method

(Scale 1:1000) Legend: (a) Body. (b) Axe in bushes. (c) Disturbed grass.

4.4.7 Electronic Graphics

Advances in electronics have further simplified the sketching process. Computers and special software are being utilised increasingly to get the final sketch. Many software has come up in the market, which has improved the quality and the accuracy of the sketches/maps tremendously. They have also reduced the time for their preparation and drudgery. The software has also come up which can introduce image of the object in the outline of the sketch.

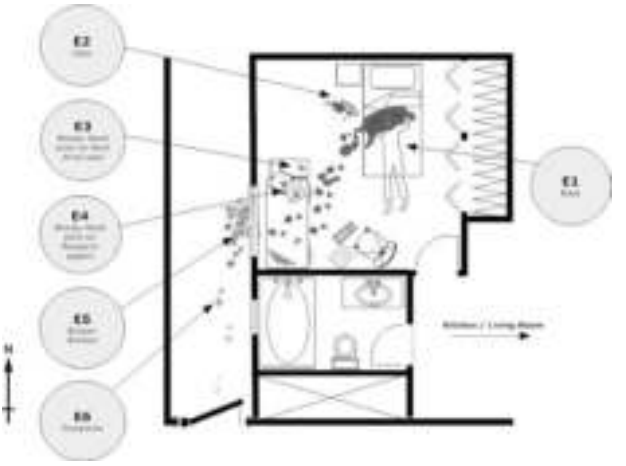

Fig. 4.13

"Smartdraw" [2] electronic software graphics. A typical 3-D sketch

4.4.8 Height Determination

It is sometimes essential to determine the height of buildings, trees, roofs, bullet holes and the like.

2. Proprietary name of the software.

There are a number of techniques for the purpose. A simple technique, without involving much of equipment, measures height with the help of two straight sticks. One (S) about 1 M long and the second (L) about 2 Ms long. The first one is correctly measured (say 1 m) and its corresponding position (L′) is marked on the longer stick. The shorter stick is fixed at a convenient distance from the object (building, tree, mountain peak) and the longer stick is fixed about 3 M ahead towards the object. The object is seen from the top of the shorter stick. The point (L″) where the line appears to cut the longer stick is noted. The height is then calculated from similar triangles SL ‘L″ and SO′ O″.

O′O″/L′L″ = SO′/SL′ = D/d

Or, O′O″ = L′L″ × D/d

Because D and d are known and L′ L″ is determined, O′ O″ can be calculated. The height of the object is O′ O″ + length of the stick (s).

In important cases, the help of surveyors for detailed drawings and sketches of expansive scenes of occurrence should be obtained. They can also determine the height of the object correctly with the help of sextant, an instrument for measuring heights (or depths).

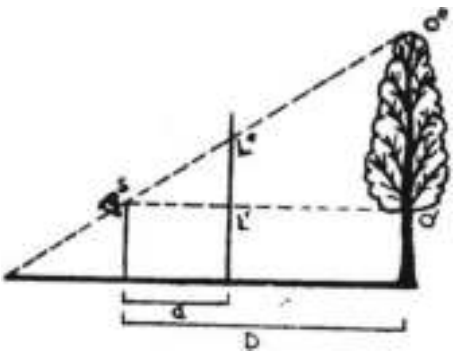

Fig. 4.14

Height determination

4.4.9 Search

Search for the clue materials requires a careful and thorough examination of the scene of occurrence. The search techniques vary from one scene to another. They also vary on the personal choice of the investigator. The following methods are common:

4.4.10 Zonal Method

In the zonal method, the scene is divided into small zones and each zone is examined in turn. In expansive scene more than one team can search their specified (allotted) zones.

1	5	9	13
2	6	10	14
3	7	11	15
4	8	12	16

Fig. 4.15
Zonal Method

4.4.11 Spiral Method

The search starts from the focal point of the scene and carried out in spiral with increasing circumference until the whole of the crime scene is covered.

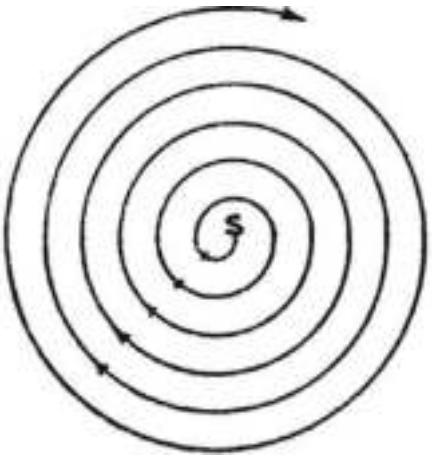

Fig. 4.16
Spiral Method

4.4.12 Strip Method

The scene of the crime is divided into strips of convenient width and each strip is examined, in turn, carefully.

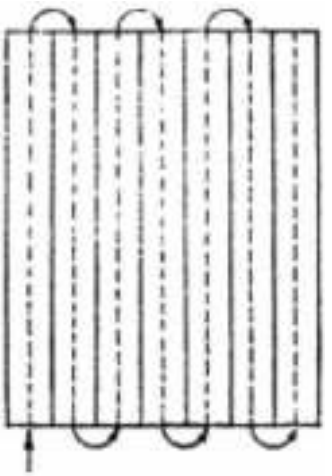

Fig. 4.17
Strip Method

4.4.13 Cross-hatch Search Method

In cross-hatch method the search is carried out two dimensionally. First the scene is covered lengthwise (as in strip method) and then width wise as shown in the diagram. It provides a double examination of the same spot.

Other methods have also been suggested in the literature. The method adopted is not so important. However, thoroughness, keen observation, care and planning are important.

It is often helpful to employ a second person or a second team to search the same scene over again.

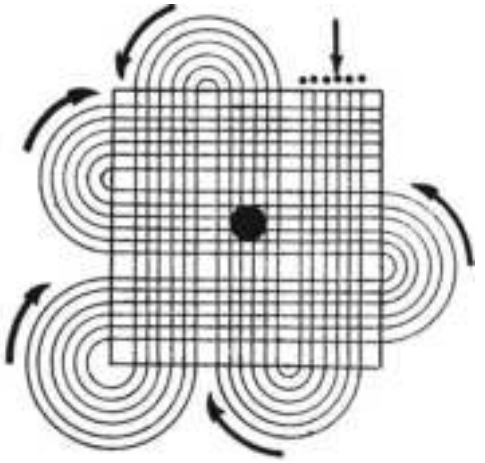

Fig. 4.18
Cross-hatch Method

4.4.14 Equipment

A torch, a hand magnifier, a compass, a measuring tape, a steel scale, a notebook and a pencil are the basic minimum requirements for the search. In addition, a number of receptacles, casting and lifting materials, and packing paraphernalia is required.

4.4.15 Handling Clues

Handling of specific clues has been discussed in various chapters. It is proposed to consider here the fundamentals only.

1. Distribution and the nature of the materials at the scene are carefully noted. All foreign (not belonging to the place) materials: weapon of offence, bullets, cartridge cases, poison containers, vomitus, wearing apparel, prints and impressions, stains and odours are clues. They should be collected and recorded irrespective of the fact whether they appear or do not appear to be relevant to the case at the time of collection.
2. The collection should be so organised that nothing is missed, nothing gets lost, misplaced or contaminated.
   - Microscopic evidence like hair, fibre, dust and paint should be collected first;
   - Prints and impressions are processed next; and
   - Larger objects are gathered last. Collection of one object should not alter, destroy or contaminate the other evidence.
3. A careless investigating officer may introduce his fingerprints on the objects handled by him. Some writers suggest the use of gloves to guard against evil. However, the practice is undesirable if it is likely to destroy microscopic and print evidence due to complacency.
4. Bacterial growth and other physical or chemical changes destroy or contaminate bio evidence especially when wet stains or liquids are sent to an examiner without taking proper precautions to prevent these changes. As a rule, wet articles (excluding liquids) should be packed only after they are perfectly dry.
5. Contamination or destruction may occur due to dirty or fragile receptacles, packing corrosive materials in containers susceptible to corrosion, and introduction of cigarette ash and dirt, due to carelessness on the part of the investigating officer.
6. There should be no seepage of materials. The original character of the contents will otherwise be lost. Plastic bags, bottles and glass containers with proper lids or stoppers prevent spilling or contamination.
7. The exhibits should be packed in such manner that they are not damaged on opening. Only one item should be packed in one packet. If necessary, a number of packets (properly marked) may be dispatched in one box or in one large-sized packet. A copy of the description of the contents of various packets in the box should be placed inside.
8. Exhibits of different cases should be packed separately.
9. The articles should not get rubbed, scratched or scraped in the transit; valuable-evidence, otherwise, gets contaminated or lost.
10. Dangerous articles and the exhibits likely to get damaged in transit should be sent through a special messenger.

11. The chain of custody of evidence should be unbroken and fully established:
    - The article recovered should be marked and initialed, with date if possible. In doing so, however, the evidence on the exhibits should not be disturbed. For example, bullets are not marked at the places where they carry marks from the barrel of the firearm. Likewise, the documents involving erasures and alterations are not marked at these sites.
    - The evidence is collected, packed and sealed in the presence of two reliable and independent witnesses and their signatures should be obtained on the sealed cover. A specimen of the seal is placed on the case file. Another specimen seal impression is sent to the expert along with the covering letter. The seal should be clear and legible.
    - The number of the case with date, the name of the police station, description of the contents, the name of the investigating officer, and the name of the witnesses along with their signatures is written on the label. The label is so secured that it does not come off easily.

In a case, exhibits were sent duly sealed to the expert, along with a specimen seal of the magistrate with whose seals these were sealed. The expert identified the seals in the court, but when the magistrate (a witness in the Sessions trial) examined the seals, he found them different from his own seal. (CH)

In another case, a bullet was sealed in a bottle. The cap (screw type) of the bottle could be unscrewed along with the patch of cloth bearing the seal impression and re-screwed without breaking the seal. (CH)

In still another case, a parcel bore six seals with the same monosyllable. When critically examined, they were found to originate from two sources. The defence alleged tampering of the evidence and got acquited. (CH)

Fig. 4.19

Defective sealing. The parcel can be opened without breaking the seals

In a murder case, the cartridge case was stored in a damp place. When they were put in the court (along with a score of other cartridge cases) fungi and incrustation had damaged the identification marks on them so much that the correct cartridge could not be identified. (CH)

In a murder case, the exhibits (a gun and a cartridge case) were correctly dispatched from the laboratory. They were exhibited on the first day. But when the expert appeared on the second day, the cartridge case could not be located anywhere. Presumably, it had been stolen from the courtroom. (CH)

In another case, the questioned document has been replaced. A fictitious document was put up in the court for the identification. (CH)

- A minimum number of persons should handle the evidence. The ideal sequence is from the investigating officer to the expert and from the expert to the court.

Investigator ⟶ **Expert** ⟶ **Court**

However, it is not always possible. A note, therefore, is kept to show where, when, and why the evidence was with a particular person.

- The exhibits are dispatched to the concerned experts promptly through a special messenger. Otherwise, the defence alleges tampering of the exhibits. Quite a number of cases are dismissed because the investigating officer did not dispatch the exhibits promptly to the expert and could not account for the delay.

4.4.16 Recording

The evidence chart (Appendix) is useful to record the collection of evidence at the scene. This chart is in addition to usual forms required by the rules.

4.5 MODERN AIDS

Keeping in view the importance of the scene of occurrence the police departments all over the world have organised systems to improve, facilitate and expedite the handling of the scene of occurrence. The facilities provided vary.

4.5.1 Investigator's Kit

Investigator's kit is a collection of items needed by the investigating officer at the scene of occurrence. It generally contains:

4.5.2 Examination kit

An examination kit contains a compass, a magnifying glass, a mirror, a torch (with spare bulbs and cells), a scale, measuring tapes, calipers, forceps, tongs and a pair of rubber gloves are the major components.

4.5.3 Making and breaking kit

Making and breaking kit contains a diamond pencil, scissors, scalpel, knife, adhesive tape, twine, wire and tool kit containing a set of screwdrivers, jimmy, adjustable wrench, wire cutter, saw, hammer and pliers.

4.5.4 Fingerprint kit

Fingerprint kit includes inking slab, ink roller, thumbprint ink tube, and powders: grey, graphite and anthracene, camel hair brushes, lifting tape, iodine fuming tube, glass wool, iodine and anhydrous calcium chloride.

4.5.5 Casting kit

Casting kit contains talcum powder, powder sprayer, lacquer and lacquer sprayer, rubber cup, ladle, plaster of Paris, sieve, aluminium strip frames, wire gauze, salt, scale and a towel.

4.5.6 Blood testing kit

Blood testing kit consists of high-quality filter paper circles about 10 cm in diameter, spatula, scalpel, droppers, pipettes, distilled water, saline solution, glacial acetic acid, benzidine, (benzidine tablets are preferable), barium peroxide and methanol.

4.5.7 Collection paraphernalia

Collection paraphernalia has numerous items. It includes a set of clamping boards with nuts and bolts, screws, nails, cardboard boxes of various sizes, (economy of space is achieved by placing one into another in the decreasing order of size), plastic and paper bags and envelopes, kraft paper and cellophane sheets, clean white linen, tissue paper, absorbent cotton, test tubes, bottles of various dimensions (20 ml, 50 ml, 100 ml, 500 ml and 1 L) with screw and glass stoppers.

Rubber bands, gummed labels, tags, needles and thread, sealing wax, seal and spirit lamp are needed for sealing and labelling.

4.5.8 Recording equipments

Recording equipments like writing board, graph paper, noting sheets, carbon paper, drawing paper, various types of forms (for example, fingerprint form, recovery memo forms) pen, pencil, coloured pencils, erasers, scale, mathematical drawing box and compass.

It is not convenient to carry all these items at all times. Nor are they necessary in every crime. It is, therefore, convenient if the items are kept ready and those required in a particular investigation are taken to the scene.

In addition, video/digital cameras are also record.

4.5.9 Mobile Laboratory

4.5.9.1 Need

An average investigating officer does not know the importance of all the traces left at the scene of the crime, nor does he know the proper sampling techniques. He may fail to preserve important items of evidence or specimens. The laboratory staff help him in this regard. They also eliminate some of the exhibits by examination at the spot. They sometimes give guidelines to the investigating officer to pursue a particular line of enquiry from the spot examination. It is, therefore, generally considered desirable that the laboratory experts should join the team to examine the scene of occurrence in all important cases.

In a multi-murder case, the author, along with the mobile unit of the laboratory pitched a tent at the scene of occurrence and assisted the investigating team:

1. *Photographed the scene, including fingerprints on the vehicle and foot and footwear marks at the site and on the route of departure of the culprits.*
2. *Provided photographic facilities to the medical team in the post-mortem examination.*
3. *Fixed/identified the culprits' departure route. Checked, photographed and collected the prints and impressions found enroute.*
4. *Indicated the possible number, height and built of the culprits from the study of the gait patterns.*
5. *Checked the footwear of some suspects and eliminated their presence at the site.*
6. *Predicted the possible types of firearms used from the size and nature of the wounds and from the projectiles recovered from the bodies.*
7. *Helped to extract projectiles undamaged, from the dead bodies at the time of postmortem.*
8. *Checked the projectiles at the time of post-mortem examination and gave the number, type and possible make of the four firearms which the culprits used in the commission of the crime.*
9. *Eliminated some firearms seized from some suspects. (CH)*

4.5.9.2 Paraphernalia

The mobile laboratory usually consists of:

4.5.9.3 An MUV or SUV vehicle, with four-wheel drive

The vehicle has customised fittings to house equipment for crime scene examination. It also carries a collapsible camp chair and a small examination table. Lighter vehicles are preferred, mainly for their speed and easy accessibility to the crime scenes in rural areas.

The vehicle is fitted with powerful storage battery, which is used for floodlights and operating the instruments where there is no electricity.

4.5.9.4 Investigator's kit

All the items mentioned in the investigator's kit above are kept in the vehicle.

4.5.9.5 Photographic equipment

A high-quality digital camera with various accessories including close-up attachments, wide-angle and telephoto lenses, photoflood lamps, flashguns, lightmeter and ultraviolet, infrared, polar screen and colour filters. A Video camera is also becoming part of the photographic kit of the Mobile Laboratory.

4.5.10 Portable Ultraviolet lamp/Infrared lamps/Small portable X-ray unit

4.5.10.1 Miscellaneous

Magnifiers, stereomicroscope, hand spectroscope, vacuum cleaner, avometer, and electricity tester.

Many state governments in India have organised **Scientific Crime Scene Units,** who visit important crime scenes. They have a scientific officer, photographer, fingerprint expert and are provided with a mobile laboratory. Their participation in the examination of the crime scenes have improved the criminal investigation tremendously.

4.5.11 Flying Squads

Most police organisations have instituted flying squads especially in large cities. A flying squad consists of a team of police officers who reach the scene of occurrence immediately and carry out preliminary duties. They have fast moving vehicles fitted with two-way communication wireless system. These squads are located at various important central points. They rush to the scene of occurrence on being informed about the occurrence. They control the situation temporarily and call in the concerned police.

Flying squads work round-the-clock in tandem. The flying squads of Delhi police are very well-organised. In many cases, the flying squads have caught the culprits red-handed. However, they have failed to meet the menace of rape incidents in the city.

The introduction of flying squads in cities has a great demoralizing effect on criminals. Well-organised squads have reduced crime.

4.6 EXPERT HELP

The experts help in handling the crime scene is becoming indispensable increasingly, especially in heinous crimes. The photographer, the medico-legal expert and the forensics experts are most useful and frequently needed. The main help they provide is given in the table below:

Table 4.1

Expert	Help
1. Photographer	**Photographer helps to** 1. Create -an accurate, complete and permanent record of the scene. 2. Fix the location of the scene, the *corpus delicti*, the evidentiary clues, the routes of ingress and egress, the movement of the culprit(s). 3. Record action. It helps to indicate the *modus operandi.* 4. Reveal the extent of depredation and damage. 6. Revive and bring the scene to the courtroom. 7. Reveal the hidden evidence. 8. Record the individual criminal's act in riots. 9. Photograph the dead, before, during and after the post-mortem to record evidence his identity and evidence thereon. 10. Use covert and trap cameras: (initiation through tripping, IR rays, making/breaking connections) and devices to automatic recording of the activity culprits at the specified scenes.

Expert	Help
	11. Provide photographic evidential help to medico-legal expert, forensic expert, Forensic psychologist and others involved, to locate, preserve and present evidence properly. 12. Record transient evidence. 13. Photograph invisible evidence through UV/IR rays.
2. Medico-legal Expert	The medico-legal is the most important expert in offences against the person, including murder. He helps to: 1. Identify whether the scene is real or fake. 2. Determine whether the victim is alive or dead. 3. Evaluate injuries whether they are old/recent, fatal/non-fatal, grievous/simple, self-inflicted or otherwise. He identifies the weapon used to inflict the injuries. 4. Identify age, sex, height, built of the victim. 5. Locate scars, deformity and tattoo marks. 6. Ascertain the cause of death, the time of death, and the number of persons who attacked him. 7. Discriminate whether the death is suicidal, accidental homicidal or natural death. 8. Verify whether the killing is in self-defence or murder. 9. Locate and help to collect evidence on the person of the deceased/injured: birthmarks, tattoo marks, GSR, projectiles, foreign matter, hair, fibres, blood stains, semen stains, nail scrapings, digital skin, body fluids as control samples and evidential material for narcotics, poisons. He also collects visceral and other material for detection of poisons, narcotics, alcohol. 10. Collect standard specimens of body materials like hair, blood, organs for comparison with corresponding crime clues. 11. Indicate the survival period after injury under the normal course. 12. Ascertain the possibility/impossibility of the acts the victim allegedly performed after injury. 13. Evaluate the symptoms observed in cases of suspected poisoning and give the name of the likely poison. 14. Find out whether the accused person is sane or insane (psychiatrist). 15. Determine the apparent motive: sex, maniac, vendetta, robbery from the injuries on the person of the victim. 16. Indicate whether the corpse was at one place or was taken from one place to another.

Expert	Help
3. Forensic Expert	The forensic expert can be dubbed as a "know-all" **(or Jack of all trades?)** in forensic science and in criminal justice system. If only one specialist is to join crime scene investigations, he is the first choice. A for A forensic expert helps the crime scene investigator to: 1. Ascertain if the incident is an Act of God, an accident, or a criminal act. 2. Establish genuine/fake nature of the alleged scene of the crime. 3. Help establish the identity of the deceased through occupational marks or materials, fingerprints DNA profiling. 4. Find if the *corpus delicti* has been moved from its original site. 5. Ascertain if a vehicle or a given vehicle has been used in the commission of the crime. If so, he determines the type of vehicle used and finds evidence to identify the vehicle involved. 6. Make quick evaluation of evidence for elimination or incrimination of the subject. 7. Help to locate, collect and preserve correct crime and sample clues. 8. Make the invisible clues visible, using UV, IR, X RAYS or chemicals. 9. Reconstruct sequence of events. 10. Verify versions. 11. Identify routes of ingress and egress. 12. Determine the nature of the weapon of offence. If a firearm has been used, its nature, the number of shots, direction and range of fire is given from the data in the medico-legal expert's report. Recovered exhibits also help. 13. Determine the motive of the crime: land, female, property and/ or revenge.

The above three types of experts are the pillars of scientific examination of a crime scene. Other specialists are required in certain special situations. They are:

- Fingerprint experts
- Footprint (track marks) experts
- Ballistics experts
- Toxicologists
- Explosive experts

- Computer specialists
- Constructional and electrical engineers
- Forensic psychologists

These experts should be on the panel of the investigating agencies, with their consent, and called for assistance whenever the need arises.

The forensic expert, at the crime scene is the indispensable necessity. Keeping in view his role at the scene many states in India have deployed scientists as mobile scientific crime scene officers. They attend important cases in their jurisdiction. They help to decide the need of other experts.

4. Police Dogs

The uncanny smelling power of dogs have made them very valuable in the examination of the crime scene. Trained dogs carry out the following duties:

1. **Guard the sites:** dogs have proved excellent guards. They guard buildings, compounds, parks and property.
2. **Track the criminals**: dogs have an uncanny power to detect scent and sound. A trained dog picks up scent of the culprit from those articles, which he/she may have touched/handled. It follows the criminal's route, adopted to his hideout.

   If the culprit has used some means of transport (horse, tonga, motor car or bus) the dog loses the scent and is unable to track. If the time interval between the flight of the culprit and the tracking is appreciable, the scent gets lost and the dog fails to follow the route. Rain, snow, storm and winds also destroy the scent.
3. **Identify criminal**: a culprit may leave some personal article at the scene. If it is kept in a closed container, the scent of the owner is preserved. If the dog is given the scent and is ordered to search the criminal among a number of persons, the dog is usually able to pick up the right person.
4. **Search Crime scene:** dogs have been trained to search the crime scene. They find out buried bodies, hidden items and articles, which may have escaped detection by the investigating officers.

   In Himachal Pradesh (India), some dogs have been trained to unearth unauthorised hidden distilleries and their products. Quite a few cases are, thus, literally unearthed.
5. **Explore Explosives**: Dogs have been trained to smell explosives. This aspect has proved particularly useful in checking air luggage to prevent aircraft sabotage. They also detect mines. Armed forces all over the world use dogs to detect mines and explosives.
6. **Locate Narcotics:** The dogs are used to detect narcotics. They have detected the drugs in special hiding places where it was difficult for human beings to detect. This aspect has proved useful to clear university campuses from drug menace.

   One late evening two police officers on a motorcycle began chasing a driver of a suspect car. After a chase through the streets of Paris, just as another police vehicle was about to overtake the suspect car, the offenders in the car fired at the police, seriously wounding one officer. One of the two offenders was arrested, but other although wounded by police in gunfire, managed to escape.

The police dog took up the trail at 4 o'clock in the morning starting off from the abandoned motor car, and led the police to the corner near a taxi rank. One of the taxi drivers stated that he had taken a wounded man to a town in the southern suburbs.

The dog was taken in a police van to this town. He took up the trail again from the place where the taxi driver had dropped the criminal. He stopped at the 10th floor of an apartment building, in front of a door where the police noticed bloodstains. The criminal was arrested. (CH)

Fig. 4.20

Artist's police dog in action

Research to capture the odour of the criminal left at the scene and to identify and compare the same through gas chromatography is going on. However, the work is yet not functional.

4.7 DOCUMENTATION OF CRIME SCENE

The police departments have realised the importance of documentation of a crime scene. They have organised various comprehensive forms to collect information. The various forms and their contents are given below they should cover most of the situations:

4.7.1 Worksheet

1. FIR No.?
2. Victim(s)?
3. Suspect(s)?
4. Scene of occurrence site?

5. Informer?
6. Date/Time of intimation?
7. Date/Time of arrival of the first police officer at the scene of occurrence?
8. Nature of the incidence?
9. Names of SIT (Scene Investigation Team) team and its leader?
10. Weather Conditions?
11. Expert help needed?
12. Date/Time of the start of processing?

4.7.2 Scene Description

1. *Victim*
   - Name, sex, age
   - Address, telephone
   - Community
   - Married/Unmarried
   - Deceased Identified
   - If yes, how accomplished
   - If no, how is it to be accomplished
2. *Next of kin*

   Record: as in (1)… first 3 items.
3. *Scene*
   - Address of the scene
   - Location
     (i) House
     (ii) Apartment
     (iii) Field
     (iv) Jungle
     (v) Other site
   - Genuine/Fake?
   - Arrival Date/Time
4. *Corpus delicti:* Condition/Position
5. Condition of body:
   - Place
   - Position
   - Fully clothed, partially clothed, unclothed/naked
   - Preservation: well-preserved, decomposed, putrefied
   - *Rigor mortis*: complete head, arms, legs
   - Lividity: front, back, sides, localized

- Color
- Blood: absent, present, location
- Ligatures marks

6. *Apparent wounds*:
   - None, gunshot wounds, stab, blunt force wounds
   - Number of wounds
   - Location: head, neck, chest, abdomen, extremities
   - Hanging
   - Weapon(s) used: type of gun, caliber, knife, others.
7. *Condition of surroundings*
8. *Odours*: body materials decomposition, other odours
9. *Evidence of last meal*: time, nature .
10. *Date/time indicators*: mail, newspapers, TV guide, milk bottles.
11. *Last contact of deceased:* date, name of the contact, type of contact.
12. *Evidence of robbery*.
13. *Evidence of drug abuse*: (prescription and non-prescription)

    If drug present, collect and send it along with the body to the medico-legal expert.
14. *Evidence of drug paraphernalia*: type
15. *Evidence of sexual deviant practices*:

    Type: collect and send the evidence along with body.
16. *Photographic Exhibits*
    - Limited number up to 6. Size 5″ × 7″, 8″ × 10″
    - Grotesque photographs impress!
17. *Injury Photographs*
    - From the scene of occurrence – police photographer
    - Before/after cleaning/after post-mortem examination/at the time of post-mortem. It is common now to prepare a video film of the postmortem process. The medico-legal expert should do it.
18. *Internal wounds*: describe, extract foreign material, seal and send for evaluation.
19. *Use/provide* only photocopies of all documents involved in all cases for daily use, to all concerned.
20. *Losses*
    a. Life
    b. Property
       - Cash
       - Ornaments
       - Crops
       - Household goods

4.7.3 Photographic Documentation

1. *Basics*
   - Proper record
   - Direction
   - Scale
   - Information/identification chit
   - Name of Investigating Officer/Photographer
   - Record of exposures
2. *Cameras:* digital or film
   - 35 mm
   - Video camera
3. *Photography*
   - Videography
   - Digital Photography
   - Aerial Photography
   - IR Photography
   - Stereo Photography
   - Photogrammetry
4. *Coverage.*
   (i) *Fix*:
      - Site
      - Scene of occurrence
      - *Corpus delicti*
      - Evidentiary clues

   (ii) Location (with markers if necessary)

   (iii) Identity
      - Ingress route: Point of entrance
      - Egress: Point of exit
      - Struggle marks
5. *Photographs of the scene of occurrence from the position of the witnesses to cover his view*
   - Cover/indicate odd act (s)
6. *Photography of crime in action*:
   - Riots
   - Demonstrations
   - Spying
   - Contraband business (drugs/arms/antiques)
   - Arson, fires
   - Burglaries

4.7.4 Sketch Documentation

1. *Two advantages*:
   - Inter-distances are available.
   - No crowding, relevant items only.
2. *Principles*
   - Direction showed
   - Distance measured
   - Scale indicated
   - At the scene
   - Legend – symbols
3. *Methods*
   - Co-ordinate
   - Extended co-ordinate
   - Polar Method

4.7.5 Evidence Recovery Log

1. *Equipment*
   - Magnifier
   - Scale, measuring tape
   - Recording/materials sketch
   - Containers
2. *Recovery log. See Appendix A*

4.7.6 Laboratory Submission Letter Format has

1. Proper reference number with date
2. A brief history of the case
3. FIR No. Copy of the FIR is attached in some cases.
4. Details of the exhibits (when, where, who, how) in each of the parcel
5. The identification marks on the exhibits
6. The number of seals used on each parcel.
7. The details of the contents of the each of the parcel separately
8. If more than one seals have been used, send corresponding specimens of all the seals.
9. If some preservative has been used, give the name and quantity used.
10. If specimen samples have been also sent, send their details.
11. Whenever a comparison is needed, always send the required samples. Send the specimens in separate packages.
12. If the exhibits (acids, volatile, fragile) need special handling, specify.

13. If the exhibits are likely to perish, disintegrate or putrefy and, hence, need immediate handling, stress the fact.
14. Give complete questionnaire about what sort of examination, comparison and evaluation you need.
15. Give the time frame about the exhibits:
    - When did the exhibits come into existence?
    - When were they packed?
    - The legal time frame for production of the exhibits and the report in the court?
16. Mention the name and rank of the messenger along with his attested signatures with whom the exhibits are sent.

4.7.7 Chain of Possession Log

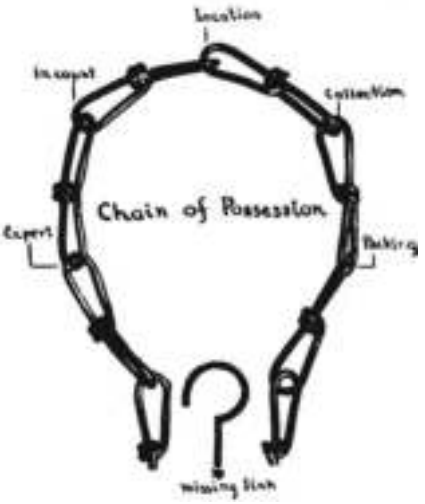

Fig. 4.21

Chain of Possession

"The scene is not the domain of any one person but of the whole team.
The body does not belong solely to the medico-legal expert any more than the bloodstains to the biologist or the pistol to the ballistics expert."

4.7.8 Broken Chain of Possession

Ensure that the possession of the exhibits is known from the time it is taken into possession to the time it is produced in the court. A proper record of the movement of the exhibits is kept in a possession Log. In fact, only sealed exhibits move and the transfer from one man to another takes place under signatures of the sealed parcel.

APPENDIX A

EVIDENTIARY CLUES

EVIDENCE CHART

1. Location	2. Date	3. Case (FIR No.)	4. P.S.		5. Investigator(s)		

Sl. No.	Evidence	Material	Quantity	Container	Seals	Witnesses	Remarks
1.	**Body Fluids:** Bloodstains, liquid blood, objects, scrapes, semen, semen stains, urine, saliva, milk, perspiration, vaginal swab or secretion, sputum, vomitus, purge.						
2.	**Corpses:** Body, body parts, bones, hair, skin, flesh, teeth, nails, viscera, intestines, muscles, kidney, liver, ear and other organs.						
3.	**Documents:** Registers, account books, cheques, receipts, bills, files, books, applications, letters, forms, pens, carbon papers, typewriters, sealing wax seals, stamps erasers, photographs and other objects.						
4.	**Explosives:** Exploded products, fuses, tins, explosive devices, photographs, objects.						
5.	**Fibres:** Hairs, fibres, strings, ropes, thread, cloth, clothes, rags, leaves and wood.						
6.	**Fingerprints:** Objects, photographs, lifts, prints.						
7.	**Firearms:** Bullets, pellets, wads, gunpowder, objects bearing bullet holes or powder residue marks, photographs, post-mortem reports, guns, their parts, ammunition live fired cartridges.

(Supreme Court case-21st Century)

4.9.1 Tracker Dog Evidence not proved Scientific[3]

Author's Summary

The importance of police dogs has been realised by all concerned. The Supreme Court, in this case, has ruled that the police may utilize the dogs for their investigations. However, as they are mute witnesses and cannot be examined/cross-examined, their evidence the courts cannot use it.

Highlights italicised

4.9.2 Relevant Extracts (Verbatim)

One of the main contentions advanced by the learned counsel is that the evidence pertaining to the sniffer dog is so fragile that no adverse inference could be drawn against the appellant on the strength of the said evidence. PW-8 is the police constable who deployed the police dog "Raja" for the purpose of tracking down the culprits of this murder. PW-8 said that police dog was brought to the place of occurrence on 15-4-1993 and that dog after smelling the blood, bloodstained handkerchief, a knife and a belt which were strewn on the floor near the dead body, began its pursuit in search of the hideout of the culprits or where the body was stashed away. The track, which the terrier followed thereafter, has been narrated by PW-8 in his evidence. The terminus of the track was the house of the appellant.

The uncanny smelling power of canine species has been profitably tapped by investigating agencies to track the culprits. Trained dogs can pick up the scent from the scene of any object and trace out the routes through which the culprits would have gone to reach their hideouts. Developing countries have utilised such sniffer dogs in a large measure. In India also, the utilisation of such tracker dogs is on the increase. Though such dogs may be useful to the investigating officers, can their movements be of any help to the court in evaluating the evidence in criminal cases?

A four-fold criticism is advanced against the reception of such evidence.

1. *First is, it is not possible to test the correctness of the canine movements through the normal method available in criminal cases, i.e. in cross-examination.*
2. *Second is that the life and liberty of human beings should not be made to depend on animal sensibilities.*
3. *Third is that the possibility of a dog misjudging the smell or mistaking the track cannot be ruled out, or many a times such mistakes have happened.*
4. *Fourth is that even today the science has not finally pronounced about the accuracy of canine tracking.*

3. *Gade Lakshmi Mangaraju v State of Andhara Pradesh,* AIR 2001 SC 26677 : 2001 Cr LJ 3317 (SC).

There are basically three kinds of police dogs – the tracker dogs, the patrol dogs and sniffer dogs. Recent trends show that hounds belonging to certain special breeds sheltered in specialised kennels and imparted with special training are capable of leading investigating agency to very useful clue in crime detection and thereby help detectives to make a breakthrough in investigation. English courts have already started treating such evidence as admissible. In Canada and in Scotland such evidence has become, of late, admissible though in the United States the position is not uniform in different States.

The weakness of the evidence based on tracker dogs has been dealt with in an article "Police and Security Dogs".

> *The possibility of an error on the part of the dog or its master is the first among them. The possibility of misunderstanding between the dog and its master is close to its heels. The possibility of a misrepresentation or a wrong inference from the behaviour of the dog could not be ruled out. The last, but not the least, is the fact that from a scientific point of view, there is little knowledge and much uncertainty as to the precise faculties which enable police dogs to track and identify criminals. Police dogs engage in these actions by virtue of instincts and also by the training imparted to them.*

We will now refer to two decisions of this court in which the evidence relating to sniffer dogs movement have been tested.

In *Abdul Razak Murtaza Dafadar v State of Maharashtra*, AIR 1970 SC 283 : 1970 Cr LJ 373 : (1970) 1 SCR 551, a three-Judge Bench of this court declined to express any concluded opinion or to lay down any general rule with regard to tracker dog's evidence or its admissibility against the accused, as it was not necessary to do so on the fact situation. However, their Lordships made the following observations on the usefulness or otherwise of such evidence (Para 11):

> *It was argued that the tracker dog's evidence could be likened to the type of evidence accepted from scientific experts describing chemical reactions, blood tests and the actions of bacilli. The comparison does not, however, appear to be sound because the behaviour of chemicals, blood corpuscles and bacilli contains no element of conscious volition or deliberate choice. But dogs are intelligent animals with many thought process similar to the thought processes of human beings and wherever you have thought processes there is always the risk of error, deception and even self-deception. For these reasons we are of the opinion that in the present state of scientific knowledge evidence of dog tracking, even if admissible, is not ordinarily of much weight.*

In *Surinder Pal Jain v Delhi Administration*, AIR 1993 SC 1723 : 1993 AIR SCW 1561 : 1993 Supp (3) SCC 681 : 1993 Cr LJ 1871, a two-Judge Bench expressed the opinion that "the pointing out by the dogs could as well lead to a misguided suspicion that the appellant had committed the crime, so their Lordships sidelined that item of evidence from consideration.

We are of the view that criminal courts need not bother much about the evidence based on sniffer dogs due to the inherent frailties adumbrated above, although we cannot disapprove the investigating agency employing such sniffer dogs for helping the investigation to track down criminals.

Investigating exercises can afford to make attempts or forays with the help of canine faculties but judicial exercise can ill afford them.

4.9.3 Identification of accused by sniffer dog[4]

Author's Summary

Since nobody was named in the FIR, the Investigating Officer took the help of the dog squad and the dog handler. Dog tracking proceeding was done and the dog tracked the accused. The accused who was then taken into custody gave statement regarding commission of crime. Though the statement was not admissible, at his instance the sickle as well as blood stained cloths were recovered. The report proved that the sickle was blood stained. The Doctor has given statement that the injury caused upon the victim could have been caused by the weapon so recovered which establish that the said weapon was used in committing the murder. Father of the victim had given statement that earlier the accused eve-teased his daughter for which his nephew scolded accused. There is no evidence to suggest that the father of the deceased had any enmity or grudge with anyone who may be suspected to have committed the murder. All these circumstances proved that it is nobody else but the accused who attempted to commit rape and murdered the deceased.

4.9.4 Relevant Extracts (Verbatim)

It urged on behalf of the appellant that identification of accused by sniffer dog cannot be relied upon as it is not admissible in order to prove the guilt of the appellant.

In *Dinesh Borthakur v State of Assam,* (2008) 5 SCC 697, this Court held:

"the law in this behalf is settled that while the services of a sniffer dog may be taken for the purpose of investigation, its faculties cannot be taken as evidence for the purpose of establishing the guilt of an accused."

In the present case, the services of a sniffer dog was taken for investigation. The said dog traced the accused and he was formally arrested in the evening of the next day. The Investigating Officer, Ashok Kumar Yadav (PW-10) corroborated the evidence of Abdul Lais Khan (PW-4) to the effect that "'Raja"' sniffer dog after picking up scent from the place of occurrence tracked down the house of the accused. What is relevant to note is that the accused has not been convicted on the ground that the sniffer dog tracked down the house of the accused and barked at him. The evidence of dog tracking only shows how the accused was arrested. The Trial Court and the Appellate Court noticed the motive of the accused. Ram Chandra Chaurasiya (PW-1) disclosed in his evidence that a few days before the date of occurrence, the accused has teased his daughter and also threatened her.

Her daughter Km."x" complained about the misconduct of the accused to her cousin Ashok Kumar and the latter admonished the accused for the same. Ashok Kumar died subsequently but the evidence of the girl's father is quite convincing and worthy of credit. The aforesaid incident clearly reflects upon the motive of the accused. The prosecution has brought on record evidence as to string of her trouser was found untied and the trouser had been taken down. She was lying naked when found dead. The scene at the site of occurrence indicates that the trouser of the deceased had been taken down with a view to outrage her modesty.

A portion of her dupatta was found thrust in her mouth so as to gag her. The other part of the dupatta was found in the incised wound on the neck so as to soak blood. The pair of the chappals of the deceased was lying at a distance. The wheat plants were noticed to be trampled which indicates violence and a scuffle between the victim and the assailant. The

4. *Lalit Kumar Yadav v State of Uttar Pradesh,* Criminal Appeal No, 1022 of 2006, decided on 25 April 2014 (SC).

episode of eve-teasing of the girl indicates that the accused wanted sex with her and it was in this background that he made a forcible attempt to rape her. It appears that the girl was bold and brave and she resisted the accused forceful attempt which enraged and provoked the accused to eventually commit the heinous act. Since there is no direct evidence to prove the guilt of the accused the Trial Court and the Appellate Court considered the circumstances which led towards the accused?

Admittedly, nobody was named in the FIR but referring to the incident that Km. "x" was murdered the FIR was lodged. Since nobody was named in the FIR the Investigating Officer took the help of the dog squad and the dog handler Abdul Lais Khan (PW-4) came with the dog. Dog tracking proceeding was done and the dog tracked the accused. The said fact is not disputed. The accused who was then taken into custody gave a statement regarding the commission of crime. Though the statement is not admissible, at his instance the sickle as well as blood stained cloths were recovered. The report proved that the sickle was blood stained. The Doctor has given statement that the injury caused upon the victim could have been caused by the weapon so recovered which establish that the said weapon was used in committing the murder.

Ram Chandra Chaurasiya (PW-1) father of the victim had given statement that earlier also the accused eve-teased his daughter Km. "x" for which his nephew Ashok Kumar scolded accused. Ram Prakash (PW-3) although turned hostile had made statement that accused had confessed to him that since the girl has refused sexual relationship with him he had murdered her. Though such statement cannot be relied upon independently to hold the accused guilty, other chain of evidence reaches to only one conclusion, i.e., against the accused. Recovery of a handkerchief from the place of murder, with the mark of "Heart" and inscription of the words "I Love You", establishes that some person was close to her.

The position of her cloth of the lower body "salwar" establish that the person tried to have sex with the girl and the injuries on the fingers of the girl also established that she protested somehow. These circumstances also lead to the conclusion that the person who could not succeed in outrage the modesty of the girl, murdered her. There is no other evidence contrary to it. Further, there is no evidence to suggest that the father of the deceased had any enmity or grudge with anyone who may be suspected to have committed the murder. All these circumstances proved that it is nobody else but the accused who attempted to commit rape and murdered the deceased Km."x".

4.10 ADDITIONAL CASE LAW

4.10.1 Police Dogs Identification[5]

During the investigation, the assistance of tracker-dog "Kumar" was used by the police and the bag and clothes of the accused were recovered with the assistance of this tracker-dog, who also led the police to the house of the accused. The admissibility of this evidence and, more importantly, the evidentiary value of dog-tracking evidence has been seriously questioned and, therefore, requires to be examined and the issues decided. Investigating agencies often use the services of tracker-dogs and the question, therefore, arises as to how reliable is this class of evidence. The orthodox view was that though it is admissible, it is not of much utility and, consequently, that it did not ordinarily have such weight.

There has been considerable development of research and thinking on the subject and the modern trend is that such evidence is of an extremely high calibre.

5. *Babu Mughal Sheikh v State of Maharashtra,* 1993 Cr LJ 2808 (SC).

Undoubtedly, evidence in criminal cases, and in particular ones where the charges are serious, must pass the dual tests of absolute reliability and infallibility. That a tracker-dog cannot be influenced is something strongly in its favour and what lends this class of evidence a special blend of acceptability.

On the question of margin of error, experience has shown that the special skills of a tracker dog outclasses all other forms of detection; even sophisticated gadgetry. It is now universally acknowledged that in detecting drugs, where every other form of human ingenuity and gadgets are capable of being eluded, that it is virtually impossible to avoid detection when a trained tracker-dog is used, explaining why this mode is found to be the most reliable and fool-proof. Similar has been the experience in cases of robbery, murder, and the like where the scent is fresh and the area not too crowded. Statistics has shown that in many cases dogs have been unsuccessful in detection due to limiting factors, but that wherever they have tracked down an object or a culprit the dog was never wrong. Such evidence will, therefore, have to be categorised as being of the highest order and reliability.

This is one of the few cases in which the services of a tracker-dog had been utilised. The police brought one of the dogs by the name of Kumar to the scene of offence and it is alleged that a dagger was found at the scene stained with blood. It is further alleged that on the basis of the scent which the dog picked up at that place, that the dog went to the field of the accused and pointed out to the police the bag and the *Khaki* coat belonging to the present accused, both of which were recovered from that spot. It is also alleged that the dog led the police to the house of accused No. 1. This evidence is acceptable in view of the position in law that such evidence is in fact admissible.

Mr. Vaidya had attacked both the admissibility and the evidentiary value of the dog-tracking evidence. It is seldom that this issue has been raised before the courts and the only reported decision on the point, wherein the Supreme Court had occasion to refer, only in passing to such evidence, is in the case of *Abdul Razak Murtaza Dafadar v State of Maharashtra*[6]. While dealing with this question, their Lordships had occasion to observe as follows:—

> *The tracker-dog's evidence cannot be likened to the type of evidence accepted from scientific experts describing chemical reactions, blood tests and the actions of bacilli, because the behaviour of chemicals, blood corpuscles and bacilli contains no element of conscious volition or deliberate choice. Dogs are intelligent animals with many thought processes similar to the thought process of human beings and wherever there are thought processes there is always the risk of error, deception and even self-deception.*

Considerable research has been done on the subject. It is necessary to point out that in Canada and Scotland, evidence of dog-tracking is admitted and relied upon by the courts. As far as the United States is concerned, the position is conflicting insofar as the courts have placed reliance on such evidence in some cases, but have rejected it in others. Dog-tracking evidence is admissible in England and in criminal trials it is often used by the prosecution. There are certain safeguards which need to be borne in mind in such cases. The position as it obtained formerly is illustrated in the following passage from the case of *R v Montgomery,* 1866 NI 100:—

> *There are three objections which are usually advanced against the reception of such evidence.*
>
> First*, since it is manifest that the dog cannot go into the witness box and give his evidence on oath, and consequently submit himself to cross-examination, the dog's human companion must go into the box and report the dog's evidence, and this is clearly hearsay.*
>
> Secondly*, there is a feeling that in criminal cases the life and liberty of a human being should not be dependent on canine inferences. And*

6. *Abdul Razak Murtaza Dafadar v State of Maharashtra*, AIR 1970 SC 283 : (1970) 1 SCR 551 : 1970 Cr LJ 373.

> Thirdly, *it is suggested that even if such evidence is strictly admissible under the rules of evidence, it should be excluded because it is likely to have a dramatic impact on the jury out of proportion to its value.*

Subsequently, however, the position has been quite unambiguous and has changed drastically. What the courts have insisted upon is that the evidence must pass the test of scrutiny and reliability as in the case of any other evidence. The following guidelines must, however, be borne in mind:—

> *(a) That there must be a reliable and complete record of the exact manner in which the tracking was done and to this extent, therefore, in this country, a panchnama in respect of the dog-tracking evidence will have to be clear and complete. It will have to be properly proved and will have to be supported by the evidence of the handler.*
>
> *(b) It will be essential that there are no discrepancies between the version as recorded in the panchnama and the evidence of the handler as deposed to before the court.*
>
> *(c) The evidence of the handler will have to independently pass cross-examination.*
>
> *(d) The material will have to be placed before the court by the handler, such as the type of training imparted to the dog, its past performance, achievements, and reliability, supported, if possible and available, by documents.*

It is scientifically accepted that dogs are rated as extremely intelligent animals and that some of their sensibilities are very highly developed and are extremely reliable. It is also to be noted that there are some breeds of dogs and some strains that are specially utilised for hunting and tracking because of their abnormally high talents, *if the dog belongs to one of these categories and if it is shown to the court that it has been specially trained for purposes of detection, not only would the dog-tracking evidence will be admissible, but it will have to be relied upon as being evidence of a very high calibre.*

4.10.2 Location of the Scene[7]

We also find that the trial court as well as the High Court had brushed aside the objection that the blood recovered from the place of occurrence was not sent for chemical examination. *We think that a failure of the police to send the blood for chemical examination in a serious case of murder, such as the one before us, is to be depreciated. In such cases, the place of occurrence is often disputed. In the instant case, it was actually disputed.* However, such an omission need not jeopardise the success of the prosecution case where there is other reliable evidence to fix the scene of occurrence.

4.10.3 No Blood at the alleged Scene[8] (Fake Scene)

The accused was said to have speared the deceased in the abdomen and on the left thigh, as a result of which the deceased fell down on the spot (in the street) with his back downwards. *In acquitting the accused, the Sessions Judge was much impressed with the circumstance that there was no explanation as to why there was no blood at the spot. The Sessions Judge was not satisfied that the occurrence took place at the place sworn by the P.Ws.* The evidence shows that although two injuries were caused and one of the questions which had been raised by the defence was that there was no blood at the spot, no attempt was made by the prosecution to show the reason why there was no blood at the spot. There was also no blood on the cot on which the dead body was lying nor a trail of blood to the house.

---

7. *Raghunandan v State of Uttar Pradesh*, AIR 1974 SC 463 : (1974) 4 SCC 186 : 1974 Cr LJ 453 (SC).
8. *State of Punjab v Bihari Lal Pahu Lal*, AIR 1953 P&H 218.

4.10.4 Preservation and Guarding of the Scene[9]

Exhibits 2/1 and 2/2 are enlargements of photos taken of the impressions on the wall of the room. They were prepared by the photographer Ghose who went to the spot on the 4th April in order to take the photograph. The photograph was taken in the presence of the senior fingerprint expert, R.N. Sinha and the investigating officer, K.B. Karan (P.W. 25). The impressions were seen *'in situ'* by the Sessions Judge (*vide* his note of memorandum of local inspection at page 52 of the paper book) and were then scraped by assistant sub-inspector Rajmani Lal (P.W. 26) who himself took them to the chemical examiner for chemical analysis. The result of the chemical analysis was that they were both found to contain blood and the print on the eastern side of the door corresponding to the enlargement Ext. 2(1) was found to contain human blood. The blood in the other impression, which was a very small one, was found to have disintegrated and so its origin could not be determined. In view of the evidence set out there is no difficulty in connecting the enlargements (2/1) and (2/2) with the impressions on the wall of the room of Anand Prakash.

Great stress has been laid on the fact that the impressions were not discovered till the 4th of April. It appears from the evidence, however, that they could only be seen in the light of a flood lamp as the room was badly lit. In this connection, our attention was drawn to the fact that photographer Ghose took some photographs on the 28th of February at the spot and it is suggested that he did have a flood lamp with him that day. This cannot be correct because Ghose himself deposes:

> *I could not take photos inside this house as the light was not sufficient, but I took some photos of some footprints on the ground of the room of the house.*

The question of insufficient light could not have arisen if a floodlight was available. All that happened on the first day probably was that the photographer took photographs of footprints in portions of the room which were better lit than the remainder of the room.

Suggestions have been made to the fingerprint expert, R.N. Sinha, in the course of cross-examination about the possibility of transferring finger impressions on the walls of the house in order to falsely implicate a suspect person and it is urged that the appellant Karu was a prisoner and prints of his fingers and palms had been taken when the discovery was made. *It is in evidence, however that from the very first the investigating officer put the room in which the occurrence had taken place under seal and throughout the investigation he had a constable continually on duty guarding the room. There is, therefore, no reason to think that the impressions found on the wall were impressions fraudulently placed there in order to implicate Karu Gope.*

4.10.5 Identity of the Scene[10]

It was argued with great vehemence in the High Court as well as in the Court of Sessions that there was trail of blood from the front door of the house of the Vakil into the corridor rooms marked H and H-l in the plan and that supported the defence theory that the deceased Kanan received the stab injuries not in or near the house in question but somewhere far away near the railway station. The High Court took the view that if Kannan had received the injuries somewhere outside the house it was impossible for him to have come into the room in view of the doctor's evidence.

> *It was concluded on the material placed on the record that there could be no room for doubt that Kannan received the injuries in the room itself and not outside, and that he was carried out*

9. *State of Bihar v Karu Gope*, AIR 1954 Pat 131 : 1953 BLJR 488 : 1954 Cr LJ 201 (Pat).
10. *Marachalil Pakku v State of Madras*, AIR 1934 SC 648 : 1954 Mad WN 670 : 1954 Cr LJ 1668 (SC).

of the room while life was still lingering and therefore there would be dripping of blood from the body during the course of transit as the injuries were very serious and vital arteries had been cut.

4.10.6 Manipulation of the Scene[11]

P.W. 1, Tabedar Khan, the investigating officer, stated that on the day of occurrence he searched carefully the walls of Kanhaiyalal's shop as also the ground in front of his house but did not find any bullets and that if they had struck the plinth or the wall of Kanhaiyalal's shop or any shop close by, the bullets ought to have been recovered as the place itself was such that they could not have been lost.

To the same effect is the statement of the ballistics expert who saw the place of occurrence and gave the opinion that judging the direction of firing and the position of Bhagwati at that time, the bullets should have been found somewhere near the scene of occurrence and that they could not just disappear in the air.

The fact that the bullets were not found only makes it doubtful whether, if the revolver had been fired, the firing was in the circumstances and in the direction deposed to by the prosecution witnesses.

There is also no evidence to indicate that the ground in front of Kanhaiyalal's shop was so soft that it was very easy for a bullet to get embedded deep into the ground and that it was, therefore, difficult and impossible to disenter it from the ground. On the other hand, the evidence is that the road in front of Kanhaiyalal's shop was a metalled road and that the ground very close to his shop was a hard one.

Coming now to the production in evidence of a picture with a broken glass as an article which was hit by one of the shots fired by the respondents and found embedded in a Balli, we have formed the same opinion as the learned Sessions Judge did of that evidence being false and manipulated. At the time of the incident the picture was just above door in a wall some ten feet behind the spot where Bhagwati was. It was decorated by a paper garland.

It is said that one of the shots fired by the accused person struck the glass plate covering the picture causing a hole therein and at a corresponding place in the picture and the bullet then pierced the wooden beam behind the picture. According to the prosecution, the damage done to the picture was first noticed on 7 December 1955, by Kanhaiyalal when he was cleaning the picture. While cleaning he found a hole in the glass and the hole was covered by tassels of a paper garland which, contrary to the usual mode of putting garland, were on the top.

He accordingly informed the police, of what he had seen and after the arrival of the police, the bullet was removed from the beam. Now, it is in evidence that immediately after the occurrence Tabedar Khan and several other police officers including a Deputy Superintendent of Police closely inspected the scene of occurrence and the wall where the picture was hung. But none of them found any bullet or any mark of the striking of any bullet. Tabedar Khan, the investigating officer is very-very emphatic on the point.

Tabedar Khan did not find any crack or hole or anything odd in the picture when he inspected it. If, then on 22 November 1955, Tabedar Khan and other police officers did not find any hole and even cracks in the glass which Kanhaiyalal, the sub-inspectors Bhadora and Narendra Singh and the witnesses P.W. 9 Shankerlal and P.W. 19 Nathu, saw on 7 December 1955, it is impossible to hold that the damage to the picture was caused on 22 November 1955, itself by the striking of a bullet.

It is beyond our comprehension as to how the bullet according to the prosecution pierced the glass and got embedded in the beam behind it, did not, when it struck the glass, make any

11. *State of Madhya Pradesh v Babulal Ramratan*, AIR 1958 MP 55 : 1958 Cr LJ 190 (MP).

sound and reduce the glass to splinters or at least break it into pieces. It is also strange that no one heard sound of the striking of the bullet. It is not the suggestion of the police that the glass-plate covering the picture was of a special kind in which a bullet could be fired noiselessly causing only a hole and no other damage.

In his evidence Major Sonaone said that the striking of the bullet on the glass-plate covering the picture would create considerable sound and that if the hole in the picture was covered by a garland it should also have been damaged and disturbed. But the garland was found without any damage and no one heard the sound of the striking of the bullet and no one saw any glass pieces falling on the ground.

It is worthy to note that the glass-plate containing the hole was not sent to Major Sonaone for examination. It was not produced in the case. There is no mention of a broken glass containing a hole in the seizure memo. It refers only to the glass as one broken at the top. The production of the pieces of glass containing a hole would have indicated whether any pieces of broken glass would or would have not fallen on the ground after the striking of the bullet.

Learned government-advocate contended that Kanhaiyalal's shop being an open place it was impossible to implant a bullet in the beam behind the picture or fire a shot at the picture. As to this it is sufficient to say that the possibility of an expert hand firing a shot at the picture in the quiet hours for the purpose of creating evidence cannot be ruled out in this case. *Such being the circumstances in which the picture was found and the bullet was recovered from a beam on 7 December 1955, we are driven to the conclusion that this evidence of one of the shots hitting the picture and a bullet getting embedded in the beam behind it is a fabrication from start to finish.*[12]

4.10.7 Clues: Location, Collection, Chain of Custody[13]

It has been pointed out that the '*hasua*' was not shown to the photographer for identification in court. There is, however, sufficient evidence, as I have indicated, to connect the enlargement Ext. 2 with the impression on the '*hasua*' in question. This cannot be said about the enlargement Ext. 3 which is said to be an enlargement of the photo of the bloody footprint seized from the room of the deceased Anand Prakash on 8-3-1951. All that the photographer Ghose says about this photograph is:—

I took photos of papers having footprints. This is a negative of this footprint. (Ext. 4) and this is the enlarged photo of this negative (Ext. 3)..... I got the paper containing the footprint.

Neither the investigating officer nor any of the officers of the criminal investigation department tells us how the paper containing the footprint came into the possession of photographer Ghose for this purpose, and there is no evidence to identify paper with the paper that was seized on the 8th of March. That paper is said to have been sent to the chemical examiner and the chemical examiner's report with the paper has disappeared. It is, therefore, not possible to connect with the occurrence the paper from which the enlargement Ext. 3 has been prepared and this document is of no value as connecting Bhorik with the occurrence.

4.10.8 Police Dogs Identification[14]

Tracker-dog's evidence reliable "being of extremely high caliber"

> During the investigation, the assistance of tracker-dog 'Kumar' was made use of by the police and the bag and clothes of the accused were recovered with the assistance of this tracker-dog, who also led the police to the house of the accused. The admissibility of

On the question of margin of error, experience has shown that the special skills of a tracker dog outclass all other forms of detection; even sophisticated gadgetry. It is now universally acknowledged that in detecting drugs, where every other form of human ingenuity and gadgets are capable of being eluded, that it is virtually impossible to avoid detection when a trained tracker-dog is used, explaining why this mode is found to be the most reliable and fool-proof. Similar has been the experience in cases of robbery, murder and the like where the scent is fresh and the area not too crowded. Statistics have shown that in many cases dogs have been unsuccessful in detection due to limiting factors, but that wherever they have tracked down an object or a culprit that the dog was never wrong. Such evidence will, therefore, have to be categorised as being of the highest order and reliability.

This is one of the few cases in which the services of a tracker-dog had been utilised. The police brought one of the dogs by the name of Kumar to the scene of offence and it is alleged that the dagger was found at that spot stained with blood. It is further alleged that on the basis of the scent which the dog picked up at that place, that the dog went to the field of the accused and pointed out to the police the bag and the Khaki coat belonging to the present accused, both of which were recovered from that spot. It is also alleged that the dog led the police to the house of accused No. 1. This evidence is acceptable in view of the position in law that such evidence is in fact admissible.

Mr. Vaidya has attacked both the admissibility and the evidentiary value of the dog-tracking evidence. It is seldom that this issue has been raised before the courts and the only reported decision on the point, wherein the Supreme Court had occasion to refer, only in passing to such evidence, is in the case of *Abdul Razak Murtaza Dafadar v State of Maharashtra*[15]. While dealing with this question, their Lordships had occasion to observe as follows:—

> *The tracker-dog's evidence cannot be likened to the type of evidence accepted from scientific experts describing chemical reactions, blood tests and the actions of bacilli, because the behaviour of chemicals, blood corpuscles and bacilli contains no element of conscious volition or deliberate choice. Dogs are intelligent animals with many thought processes similar to the thought process of human beings and wherever there are thought processes there is always the risk of error, deception and even self-deception.*

Considerable research has been done on the subject. It is necessary to point out that in Canada and Scotland, evidence of dog-tracking is admitted and relied upon by the courts. As far as the United States is concerned, the position is conflicting insofar as the courts have placed reliance on such evidence in some cases, but have rejected it in others. Dog-tracking evidence is admissible in England and in criminal trials it is often used by the prosecution. There are certain safeguards which need to be borne in mind in such cases. The position as it

15. *Abdul Razak Murtaza Dafadar v State of Maharashtra,* AIR 1970 SC 283 : (1970) 1 SCR 551 : 1970 Cr LJ 373.

obtained formerly is illustrated in the following passage from the case of *R v Montgomery,* 1866 NI 100:—

> *There are three objections which are usually advanced against the reception of such evidence.* First*, since it is manifest that the dog cannot go into the witness box and give his evidence on oath, and consequently submit himself to cross-examination, the dog's human companion must go into the box and report the dog's evidence, and this is clearly hearsay.* Secondly*, there is a feeling that in criminal cases the life and liberty of a human being should not be dependent on canine inferences. And Thirdly, it is suggested that even if such evidence is strictly admissible under the rules of evidence, it should be excluded because it is likely to have a dramatic impact on the jury out of proportion to its value.*
>
> Subsequently, however, the position has been quite unambiguous and has changed drastically. What the courts have insisted upon is that the evidence must pass the test of scrutiny and reliability as in the case of any other evidence. The following guidelines must, however, be borne in mind:—
>
> (a) That there must be a reliable and complete record of the exact manner in which the tracking was done and to this extent, therefore, in this country, a *panchnama* in respect of the dog-tracking evidence will have to be clear and complete. It will have to be properly proved and will have to be supported by the evidence of the handler.
>
> (b) It will be essential that there are no discrepancies between the version as recorded in the *panchnama* and the evidence of the handler as deposed to before the court.
>
> (c) The evidence of the handler will have to independently pass cross-examination.
>
> (d) The material will have to be placed before the court by the handler, such as the type of training imparted to the dog, its past performance, achievements, reliability, supported, if possible and available, by documents.
>
> It is scientifically accepted that dogs are rated as extremely intelligent animals and that some of their sensibilities are very highly developed and are extremely reliable. It is also to be noted that there are some breeds of dogs and some strains which are specially utilised for hunting and tracking because of their abnormally high talents, *if the dog belongs to one of these categories and if it is shown to the court that it has been specially trained for purposes of detection, not only would the dog-tracking evidence will be admissible, but it will have to be relied upon as being evidence of a very high calibre.*

4.10.9 Tracker Dog's Lacunae[16]

It was lastly urged on behalf of the appellant that the lower courts ought not to have relied upon the evidence of dog tracking and such evidence was not admissible in order to prove the guilt of the appellant. The evidence of tracker dogs has been much discussed. In Canada and Scotland it has been admitted. But in the United States there are conflicting decisions:

> *There have been considerable uncertainty in the minds of the courts as to the reliability of dogs identifying criminals and many conflicts of opinion on the question of the admissibility of evidence. A survey of the cases, however, reveals that most courts in which the question of the admissibility of evidence of trailing by blood hounds has been presented to take the position that upon a proper foundation being laid by proof that the dogs were qualified to trail human beings and that the circumstances surrounding the trailer were such as to make it probable that the person trailed was the guilty party, such evidence is admissible and may be permitted to go to the jury for what it is worth as one of the circumstances which may tend to connect the defendant with the crime. [Para 378, Am. Juris, 2nd Edn., Vol. 29, p. 429].*

16. *Abdul Razak Murtaza Dafadar v State of Maharashtra*, AIR 1970 SC 283 : (1970) 1 SCR 551 : 1970 Cr LJ 373.

There are three objections which are usually advanced against the reception of such evidence.

1. *First*, since it is manifest that the dog cannot go into the box and give his evidence on oath, and consequently submit himself to cross-examination, the dog's human companion must go into the box and report the dog's evidence and this is clearly hearsay.
2. *Secondly*, there is a feeling that in criminal cases the life and liberty of a human being should not be dependent on canine inferences.
3. *Thirdly*, it is suggested that even if such evidence is strictly admissible under the rules of evidence it should be excluded because it is likely to have a dramatic impact on the jury out of proportion to its value.

In *R. v Montgomery,* 1886 NI 160*,* a police constable observed men stealing wire by the side of a railway line. They ran away when he approached them. Shortly afterwards the police got them on a nearby road. About an hour and half later the police tracker dog was taken to the base of the telegraph pole and when he had made a few preliminary sniffs he set off and tracked continuously until he stopped in evident perplexity at the spot where the accused had been put into the police car. At the trial it appeared that other evidence against the accused that they had been stealing the wire was inconclusive and that the evidence of the behaviour of the tracker dog was crucial to sustain the conviction. In these circumstances the Court of Criminal Appeal ruled that the evidence of the constable who handled the dog on its tracking and reported the dog's reaction was properly admitted.

The court did not regard its evidence as a species of hearsay but instead the dog was described as "a tracking instrument" and the handler was regarded as reporting the movements of the instrument, in the same way that a constable in traffic case might have reported on the behaviour of his speedometer. It was argued in that case that the tracker dog's evidence could be likened to the type of evidence accepted from scientific experts describing the chemical, reactions, blood tests and the actions of bacilli. The comparison does not, however, appear to be sound because the behaviour of chemicals, blood corpuscles and bacilli contains no element of conscious volition or deliberate choice. But dogs are intelligent animals with many thought processes similar to the thought processes of human beings and wherever you have thought processes there is always the risk of error, deception and even self-deception. For these reasons we are of opinion that in the present state of scientific knowledge evidence of dog tracking, even if admissible is not ordinarily of much weight.

In the present case it is not, however, necessary for us to express any concluded opinion or lay down any general rule with regard to tracker dog evidence or its significance or its admissibility as against the appellant. We shall assume in favour of the appellant that the evidence of PW 72 and of the punches with regard to the identification of the appellant by the tracker dog is not admissible. Even on that assumption we are of opinion that the rest of the prosecution evidence namely the confession of the appellant Ex. 130 and the discovery of the spanner conclusively prove the charges of which the appellant has been convicted.[17]

4.10.10 Utility of Tracker Dogs[18]

Utility of tracker dogs in crime detection is on the increase as their use has been yielding profitable clue to crack down culprits in many a crimes. It was once thought that human liberty should not depend upon canine sensibilities due to inherent drawbacks. One of them is

17. *Razak Murtaza Dafadar v State of Maharashtra*, AIR 1970 SC 283 : (1970) 1 SCR 551 : 1970 Cr LJ 373.
18. *Bhadran v State of Kerala*, 1995 Cr LJ 676 : (1995) 1 Cr CJ 87 : ILR (1995) 1 Ker 269 (Ker).

the liability to subject the evidence to cross-examination. Another is the possibility of the dog misjudging the smell or mistaking the track. But recent trends show that hounds belonging to certain special breeds sheltered in specialised kennels and imparted with special training are capable of leading investigating agency to very useful clue in crime detection and thereby help detectives to make a breakthrough in the investigation. English courts have already started treating such evidence as admissible. In Canada and in Scotland such evidence has become, of late, admissible though in United States the position is not uniform in different States.

The Supreme Court, without reaching any final opinion on the subject, has once observed in *Abdul Razak Murtaza Dafadar v State of Maharashtra*, AIR 1970 SC 283 : 1970 Cr LJ 373 : (1970) 1 SCR 551 that dogs are intelligent animals with many thought processes similar to the thought processes of human beings though the evidence relating to tracker dog cannot be likened to the evidence of scientific experts describing chemical reactions, blood tests and the actions of bacilli. It is advantageous to refer to the decision rendered by a learned single Judge of the Bombay High Court in *Babu Magbul Shaikh v State of Maharashtra,* 1993 (3) Bom CR 309 : 1993 Mah LJ 1118 : 1993 Cr LJ 2808 (SC). Learned Judge pointed out that if the evidence passes tests of scrutiny and reliability as in the case of any other evidence, there is no warrant to treat it as inadmissible. Some guidelines have been laid down in the said decision. The following observations of the learned Judge are useful in this context as reflecting the correct position on the subject:

> *It is scientifically accepted that dogs are rated as extremely intelligent animals and that some of their sensibilities are very highly developed and are extremely reliable. It is also to be noted that there are some breeds of dogs and some strains which are specially utilised for hunting and tracking because of their abnormally high talents. If the dog belongs to one of these categories and if it is shown to the court that it has been specially trained for purposes of detection, not only would the dog-tracking evidence be admissible, but it will have to be relied upon as being evidence of a very high calibre.*

We are also of the view that evidence relating to movements of tracker dogs cannot be rejected as inadmissible and in appropriate cases it is open to the court to consider it. Its reliability, of course, depends upon the acceptability of the testimony of persons who manned the dog and those who witnessed the movements and conduct of the animal.

In this case we do not have any evidence regarding those aspects except that the police dog reached the house of the accused. We are not disposed to rely on the said item of evidence in the absence of other necessary assurance to convince us of its acceptability.

All the same, we count the conduct of the accused in scampering away from the scene when the police dog was brought to the house of occurrence. We bear in mind that people have a belief that if police dog is brought the culprit would be traced out soon. Accused would not have been in exception to the said general belief. As the accused suddenly slipped away when dog squad arrived at the scene it was specially noticed by the persons present. The said conduct is not consistent with a hypothesis of the innocence of the accused.

4.10.11 Tracker Dog Evidence Alone Insufficient[19]

Coming to the evidence of the dog pointing out the two accused along with another non-accused, it is very difficult to give any undue importance to such material. It is true that the police has for sometime now utilised trained dogs in detecting and investigating crime, but as admitted by P.W. 4 the method is not yet scientifically established. Apart from that, while this unearthly animal with proper training may be able to help the police in unearthing a crime,

19. *Medu Sekh* v *State of Assam*, 1972 Cr LJ 362 : Assam LR (1972) Ass 489.

proper care will have to be taken by the investigating agency not to overdo it to substitute the same as the sole evidence in the trial, by somehow obtaining a confession from the person on whom the dog pounces upon. Good care will have to be taken by the investigating officer to obtain and produce admissible evidence from which independently it is possible to come to the conclusion that the accused has committed the offence. In this case, we may point out that the dog jumped upon three persons and not merely two and the third man namely Asar has not even been sent up by the police.

Besides, it is not at all certain how by merely scenting the leather sheath discovered at and seized from the place of occurrence the dog jumped at accused Medu. Neither the police officer nor P.W. 4 gives the date of the parade in which the dog Juliana took part, but it appears that an *endi chaddar* in the wearing of accused Medu was seized by the police at the police station on 10th November. When a person is detected with the help of a dog by scent identification, sufficient safeguard will have to be taken by the police to ward off suspicion against manipulation. It will be good to remember that investigation has also to be fair as well as efficient. The investigating agency will have to keep in mind that the dramatic effect of the dog jumping at the accused may not always carry the day, although it will immensely help them in their investigation and the procedure is worth of encouragement, not only by resorting to it but also by improving upon it. At any rate the canine part of the material of the squad is too indefinite and insecure and cannot have the status of evidence in the case.

4.10.12 Tracker Dog work not proved Scientifically[20]

One of the main contentions advanced by the learned counsel is that the evidence pertaining to the sniffer dog is so fragile that no adverse inference could be drawn against the appellant on the strength of the said evidence. PW-8 is the police constable who deployed the police dog "Raja" for the purpose of tracking down the culprits of this murder. PW-8 said that police dog was brought to the place of occurrence on 15 April 1993 and that dog after smelling the blood, bloodstained handkerchief, a knife and a belt which were strewn on the floor near the dead body, began its pursuit in search of the hideout of the culprits or where the body was stashed away. The track, which the terrier followed thereafter, has been narrated by PW-8 in his evidence. The terminus of the track was the house of the appellant.

The uncanny smelling power of canine species has been profitably tapped by investigating agencies to track the culprits. Trained dogs can pick up scent from the scene of any object and trace out the routes through which the culprits would have gone to reach their hideouts. Developing countries have utilized such sniffer dogs in a large measure. In India also the utilization of such tracker dogs is on the increase. Though such dogs may be useful to the investigating officers, can their movements be of any help to the court in evaluating the evidence in criminal cases?

A four-fold criticism is advanced against the reception of such evidence.

1. *First* is, it is not possible to test the correctness of the canine movements through the normal method available in criminal cases, *i.e.* in cross-examination.
2. *Second* is that the life and liberty of human beings should not be made to depend on animal sensibilities.
3. *Third* is that the possibility of a dog misjudging the smell or mistaking the track cannot be ruled out, or many a time such mistakes have happened.

20. *Gade LakshmiMangaraju v State of Andhara Pradesh,* AIR 2001 SC 26677 : 2001 Cr LJ 3317 (SC).

4. *Fourth* is that even today the science has not finally pronounced about the accuracy of canine tracking.

There are basically three kinds of police dogs – the tracker dogs, the patrol dogs and sniffer dogs. Recent trends show that hounds belonging to certain special breeds sheltered in specialised kennels and imparted with special training are capable of leading investigating agency to very useful clue in crime detection and thereby help detectives to make a breakthrough in investigation. English courts have already started treating such evidence as admissible. In Canada and Scotland such evidence has become, of late, admissible though in the United States the position is not uniform in different States.

The weakness of the evidence based on tracker dogs has been dealt with in an article "Police and Security Dogs". The possibility of an error on the part of the dog or its master is the first among them. The possibility of misunderstanding between the dog and its master is close to its heels. The possibility of a misrepresentation or a wrong inference from the behaviour of the dog could not be ruled out. The last, but not the least, is the fact that from a scientific point of view, there is little knowledge and much uncertainty as to the precise faculties which enable police dogs to track and identify criminals. Police dogs engage in these actions by virtue of instincts and also by the training imparted to them.

We will now refer to two decisions of this court in which the evidence relating to sniffer dogs movement have been tested.

In *Abdul Razak Murtaza Dafadar v State of Maharashtra*, AIR 1970 SC 283 : 1970 Cr LJ 373 : (1970) 1 SCR 551 a three-Judge Bench of this court declined to express any concluded opinion or to lay down any general rule with regard to tracker dog's evidence or its admissibility against the accused, as it was not necessary to do so on the fact situation. However, their Lordships made the following observations on the usefulness or otherwise of such evidence (Para 11):

> *It was argued that the tracker dog's evidence could be likened to the type of evidence accepted from scientific experts describing chemical reactions, blood tests and the actions of bacilli. The comparison does not, however, appear to be sound because the behaviour of chemicals, blood corpuscles and bacilli contains no element of conscious volition or deliberate choice. But dogs are intelligent animals with many thought processes similar to the thought processes of human beings and wherever you have thought processes there is always the risk of error, deception and even self-deception. For these reasons we are of the opinion that in the present state of scientific knowledge evidence of dog tracking, even if admissible, is not ordinarily of much weight.*

In *Surinder Pal Jain v Delhi Administration*, 1993 Supp (3) SCC 681 : 1993 AIR SCW 1561 : AIR 1993 SC 1723: 1993 Cr LJ 1871 a two-Judge Bench expressed the opinion that "the pointing out by the dogs could as well lead to a misguided suspicion that the appellant had committed the crime, so their Lordships sidelined that item of evidence from consideration.

We are of the view that criminal courts need not bother much about the evidence based on sniffer dogs due to the inherent frailties adumbrated above, although we cannot disapprove the investigating agency employing such sniffer dogs for helping the investigation to track down criminals.

> *Investigating exercises can afford to make attempts or forays with the help of canine faculties but judicial exercise can ill afford them.*

4.10.13 Detective Dyes – Trap Evidence[21]

The next contention of the learned counsel for the appellant is that the prosecution has failed to establish the factum of the appellant having received the illegal gratification. Apart from the fact that two Courts below have, after considering the material on record produced both by the prosecution and the defence, come to the conclusion that the prosecution has established its case, we notice that it is an admitted fact by the appellant himself that PW-1 did conceal the currency notes worth Rs. 1,500 along with the case papers which he brought to the appellant, and while handling the said case papers he did come in contact with the said currency notes without knowing of its placement. This explanation has been considered and rejected by the two Courts below and we find no reason to accept the same. From the evidence of PW-1 coupled with the facts proved by way of trap, we are satisfied that the accused did receive the money as contended by the prosecution. The learned counsel for the appellant then contended that the presence of phenolphthalein powder found in the pocket of the shirt of the accused could have been due to the fact that the accused accidentally touched his shirt pocket. This is not the defence of the accused in the Courts below and the same does not also stand to reason because the phenolphthalein powder was found in the inner lining of the shirt of the accused which could not have been possible by the accused merely touching the pocket and could have been only possible if the tainted money was kept in his pocket.

The Courts below, in our opinion, have rightly rejected the defence evidence. Therefore, in our opinion, the prosecution in this case has proved the guilt of the appellant beyond all reasonable doubts.

4.10.14 Anthracene as Detective Dye[22]

This is a case in which the police resorted to the technique of anthracene powder and ultraviolet rays. According to the prosecution, anthracene powder was applied to the currency notes and was found on the hands of the appellant. This circumstance is sought to be used to prove that the appellant had received the notes.

When the prosecution wants to prove the presence of anthracene powder on the hands of the appellant, it is the duty of the prosecution to prove by means of expert evidence or books on science the nature of anthracene powder, the manner in which its presence can be detected and the tests to be applied for the purpose. The tests must be such that if after they are applied and the results are positive, the positive results lead to one and only one conclusion, namely the finding of anthracene powder. It is for the prosecution to prove that positive results are a conclusive proof of the finding of anthracene powder. This is a matter on which experts should give evidence. The prosecution can also rely on books of science.

In this case, the prosecution has not led any evidence of this type as to the nature of anthracene powder and the means of detecting presence of anthracene powder. It is true that ultraviolet lamp was used, but there is no evidence as to the result to be expected when ultraviolet rays are applied. The complainant has merely deposed that when Vithaldas gave Rs. 100 in 10 notes of Rs. 10 each to the complainant, powder was applied and the Jamadar put them in his pocket.

He does not speak of any demonstration being given at that time. According to this witness, when the police party arrived at the house of the appellant, the Saheb asked the accused about the money and then applied light to his hands and the witness saw the powder which was shiny and greenish. As regards the Jhaba, the complainant merely says that the Jamadar held the

21. *Rangaswamy v State of Karnataka,* 2003 AIR Kant HCR 236 : 2002 (4) Kant LJ 412 : 2003 Cr LJ 607.
22. *Ram Singh Badhar Singh v State of Gujarat*, 1960 Cr LJ 1207.

Jhaba in his hands and looked inside the pocket. The complainant does not say that he noticed anything on the Jhaba. The complainant's brother Karkandia has deposed that at the Society the Jamadar applied something to the notes and said that it was powder. The witness does not speak of any demonstration or experiment having been made. He was only told that powder had been applied. He deposed that the hands of the appellant were examined but did not say what the result of that examination was. He does not speak of the alleged examination of the Jhaba under ultraviolet light. According to the Panch Kanchanlal when the first *panchnama* was made, the powder was applied to the 10 notes which were put in the pocket of Kadva. He does not speak of any demonstration or experiment having been made. According to the witness, when the Saheb saw the hands of the appellant with the lamp, they had something like powder marks. When the Jhaba was examined powder like marks were also seen in the pocket. According to the Panch Jamnadas, when the police officer applied powder to the notes, he showed them to the witness in the light of ultraviolet lamp. The witness found some stains and some slight change of colour. The stains were neither bright nor faint. When the hands of the appellant were seen in the light of the ultraviolet lamp he saw stains on his hands of the type which he had seen on the notes. When he saw the Jhaba in the light of the lamp he saw stains in the pocket of the Jhaba.

It is, therefore, not clear from the evidence of these witnesses as to whether they understood the method of detection of anthracene powder. One witness speaks of marks of powder, another witness speaks of powder like marks, a third witness speaks of a change of colour and the fourth speaks of greenish shining. Head constable Jaswant Singh, who is supposed to know something more about the powder and the means of detecting it has not been examined. Nor has any expert witness deposed that when such stains or shining are noticed in the light of ultraviolet lamp, that is a sure indication of the presence of anthracene powder or that at least makes the presence of anthracene; powder highly probable. The prosecution must lead positive evidence by way of expert evidence or books of science to prove the sure method of detection of anthracene powder, the nature of the test to be applied, the result to be 'expected and whether a layman can detect anthracene powder when such test is applied. The prosecution must also prove that if the test lead to a positive result, it conclusively proves the presence of anthracene powder and nothing else. It is difficult to believe that in this case illiterate persons like the complainant and his brother and Panchas who were laymen and not at all experts on this question were able to detect anthracene powder on the hands of the appellant and on his Jhaba. Even the police inspector does not claim to be an expert in detecting anthracene powder. Head constable Jaswant Singh has not been examined. In these circumstances, it would not be correct to hold that the prosecution has succeeded in proving the presence of anthracene powder on the hands of the appellant or in the pocket of the Jhaba. In the present case, we hold that the prosecution has failed to prove beyond reasonable doubt the presence of anthracene powder.

4.10.15 Preservation of Phenolphthalein Solution[23]

It is necessary for the investigating agency to preserve the solution used for the experiment as regards detection of phenolphthalein powder on the person of the accused or on his clothes or on anything that he has touched. In case of failure or omission of the investigating agency to preserve such solution, it is open to the court to raise an inference adverse to the prosecution at the trial, depending upon the facts and circumstances of each case, and to determine upon the impact of that inference on the other evidence before it.

23. *Rameshchandra Tukaram Talekar v State of Gujarat*, AIR 1980 Guj 1 : 1980 Cr LJ (NOC) 9 : 1979 Cr LR (Guj) 301.

The need for preservation of the solution when turns pink cannot be over-emphasized. It is a corroborative piece of evidence and the prosecution by resorting to a scientific method seeks to bring into existence a piece of evidence which is corroborative in nature. In fairness, therefore, the prosecution as well as the investigating agency are required to preserve this solution. Even the investigating agency in order to be fair to the accused should see that this solution is kept in a duly sealed bottle and preserved so that whenever its production before the court is necessary, the same can be produced. It would be worthwhile to get the solution analysed chemically prior to sending the charge-sheet with a view to get the opinion of the chemical analyser whether it contained sodium bicarbonate and phenolphthalein powder or some other chemical substance.

The investigating agency cannot have the choice of destroying this solution with impunity. In fact, it may well be said that by destroying this solution, the investigating agency is destroying a relevant piece of evidence. To this extent, it can be said that the investigating agency has been unfair to the public servant who has been trapped.

It could not be contended that once the solution is required by the defence before the court and the investigating agency declares that it did not preserve it. The court must shut its eyes, close its mind to all the evidence on record and must acquit the accused irrespective of the quality of evidence on record led against him. The correct approach in such circumstances would be to lay down the proposition so well-known and so often applied to appreciation of the court, on account of non-preservation of such solution and non-production of any other evidence as to its character as found after its analysis after the trap, may raise an adverse inference against the prosecution and may as well come to the conclusion that it would be hazardous to convict the accused in the particular circumstances of the case before it.

Held, that in the instant case the solution was destroyed not on account of any dishonesty on the part of investigating agency but on account of a direction issued by the head of the department. Therefore, the observation in the case should not have an impact one way or the other on cases pending before courts.

4.10.16 Phenolphthalein as Detective Dye[24]

We now move to the critical phase. On 6 August 1965, P.W. 1 goes to the office of the accused to get clearance of 2 finished bundles of cables. The demand for money is repeated but by this time P.W. 1 acquires skill in courtship and bargains for a smaller sum of Rs 50. Whereupon the accused signs the challan for the deposit of the excise duty on these finished products (*vide* Ex. P-4). The bribe, according to the understanding, is fixed to be paid next day in the afternoon. At this stage, P.W. 1 changes his mind and discloses his bosom to the S.P.E. officers the next morning at Kotah House (Ex. P-5). The Deputy Superintendent of Police, P.W. 7 swings into action with professional proficiency. Two officials, P.W. 3 and P.W. 4, from two different offices, are fixed up to witness the search, the programme of trapping is finalised and dramatised, the signal and other details worked out, the 5 currency notes making up Rs 50 smeared with phenolphthalein powder and the visible chemical reaction when even small particles thereof are dipped in sodium carbonate solution demonstrated. The 'raiding party' troops out after these preliminary operations are put down in Ex. P-6.

Now the scene shifts to the factory. The accused arrives, Coca Cola is served, the treacherous notes are passed and put into his gullible pockets by the unsuspecting accused, and then the

24. *Som Parkash v State of Delhi*, AIR 1974 SC 989 : (1974) 4 SCC 84 (SC) : 1974 Cr LJ 784.

sequence of rap on the door, the police presence, the surrender by the startled appellant of the tell-tale currency, his handkerchief and inner lining of the trousers pocket betray him when dipped in alkaline solution and the game is up. Such is the prosecution version substantially testified to by the witness. The inexorable course of the law takes the accused to the special judge who convicts him, the High Court affirms the guilt but reduces the sentence to one year's imprisonment.

We are certainly inclined not to swallow the evidence of PW 7 and 8 without scrutiny but after having heard the appellant at length, we are prepared to agree with the High Court that the evidence of P.Ws. 7 and 8 are substantially correct. Even here, we must underscore the importance of the findings of the trap experiment, since they go a long way to underwrite the veracity of the prosecution story.

* * * * *

Yet, the contentions have been ingeniously and hopefully presented. The basic attack has been on the morally murky mechanism of criminal trap. Who has not—our legends say even *rishis* have—succumbed to attractive temptation in loneliness laid? And courts have frowned upon evidence procured by such experiments since the participants are prone to be over-anxious and underscrupulous and the victims are caught morally unawares. Even so, there are traps and traps. Where you intercept the natural course of the corrupt stream by setting an invisible contraption, its ethics is above board. On the contrary, to test the moral fibre of an officer whose reputation is suspect, if you lay a crime 'mine' which explodes when he, in a weak moment, walks on it the whole scheme is tainted. Of course, our social milieu is so vitiated by a superstitious belief that any official can be activised by illegal gratification, so confidential is the technique of give and take in which the white collar offender is adapt and so tough is the forensic problem of proof beyond reasonable doubt by good testimony in this area that the only hope of tracking down the tricky officer is by laying traps and creating statutory presumptions. Even Kautilya has stated that—

> *just as fish moving underwater cannot possibly be found out either as drinking or not drinking water so government servants cannot be found out while taking money.*

Ex-cathedra condemnation of all traps and associate witnesses is neither pragmatic nor just, nor is it fair to denounce all public servants indiscriminately. Judicial attitudes have to be discriminating, as has happened in this case. The High Court has, after careful study, chosen to accept the *bona fides* of the trap and its author Bishnoi' a senior police official of the S.P.E. (P.W.D.). We cannot accede to the theory that the trapping of a corrupt official in the usual course, is a polluted procedure.

The appellant was a survey amin in the settlement department in circle amer, district Jaipur at the relevant time. One Kushlaram p.w. 1 asked him to survey his land and demarcate it into separate holdings for himself and his six brothers. The appellant demanded rs 100 as bribe for doing the job. The bargain was settled at rs 50, which also Kushlaram was not prepared to pay. He approached the anti-corruption department upon which a trap was laid on 28 december 1970 in nawlakha bagh, amer where the land of Kushlaram was situated. He produced five currency notes each of rs 10 before the deputy superintendent of police Ram Singh to which phenolphthalein powder was applied. When the accused went to the field of Kushlaram and began his survey, he demanded the amount, Kushlaram then, paid him five currency notes which the accused placed inside the pocket of his coat. From the field Kushlarann and the witnesses Moolchand, Motilal and Ramnarain went to the hotel of Ganesh and took tea. When the accused started from there on bicycle, a pre-arranged signal was given by Kushlaram

and the police party headed by the deputy superintendent of police came and stopped the accused. He was asked to produce the money pocketed by him, but the accused denied to have accepted any money. Search was taken and from his pocket, the aforesaid currency notes were recovered. The hands of the accused were washed and the pink colour of the water showed that his hands had been soiled with the phenolphthalein powder. The pocket of the coat was also washed and the water thereof also turned into pink colour.[25]

The plea of the accused was that when he was surveying the field, he was accompanied by Kanhaiyalal d.w. 1 and Kalicharan d.w. 2 Kushlaram wanted him to show six holdings of the field and offered him money which he did not accept and returned the amount and it was how his hands were soiled with the powder, Kushlaram went away. Meanwhile the appellant gave his coat to Kalicharan. Kalicharan went to take tea with the coat. Kushlaram met him there. Kalicharan returned the coat to the accused who put on the same as usual and it was then that the police party arrived and the money was recovered from the pocket of his coat. The substance of the plea therefore, is that the money was planted in his pocket without his knowledge.

"One photograph of a scene reveals more than its description in a thousand words"

25. *Madan Lal v State of Rajasthan*, 1976 Cr LJ 1485 : 1976 WLN 40 : 1976 Raj LW 181.

Fingerprints are God's own seals, given to us that we may recognise his greatest creation—MAN

5.1 IMPORTANCE

The identification of criminals through fingerprints was the first important break-through in the scientific investigation of crime. As usual, the judiciary and the public took some time to believe in the utility of fingerprints as a scientific aid. It is now recognised throughout the world.

The first case in which conviction was based on fingerprint identification was a unique attempt at hoodwinking the public at large in 1882. An Argentinean widow, with two living children, wanted to remarry. She found a husband but he would marry her only if she did not bring the children along. She found no way to get rid of the children except by murdering them. She murdered them and raised hue and cry that somebody else had murdered her children. Her fingerprint in blood on the door nailed her lies. She was convicted for murder. (CH)

The fingerprints as evidence are important because of the following features of the fingerprints:

- They are unique.
- They are permanent.
- They are universal.
- They are inimitable.
- They are classifiable.
- They are frequently available in crime situations, as evidence.

5.1.1 Unique

The fingers have papillary ridges. The ridges form complex patterns. The ridge pattern of each finger has the individuality of its own. The patterns vary not only from one individual to another, but they are different in the same individual on each finger. Duplication of the pattern has never been observed. Nor the same is expected. It was customary, formerly, to calculate the probability of a finger pattern occurring in a second individual. It is no longer done as the individuality of the pattern is accepted. The probability is considered only when the print carries limited details due to smudging or when it is an incomplete mark.

In a case, the character of a woman was attacked that she had been convicted earlier. Her alleged previous employer and the police official who was investigating the case identified her. On her vehement denial, the magistrate ordered that her fingerprints be checked. The check revealed that she was not a convicted woman.

The name and the features of the woman were so alike that the two witnesses who had seen her for days together made mistake about her identity. (CH)

5.1.2 Permanent

The fingerprints of an individual do not change throughout his life. In fact, the ridges appear before birth. They start appearing during the third or fourth month of pregnancy. They remain even after the death of the individual, until the epidermal skin is destroyed by fire, putrefaction or is eaten by insects or other creatures.

In a murder case, the body of the victim was partially burnt and buried. The same was discovered many days after the burial. The body was completely disfigured and could not be identified.

The investigation officer collected skin remnants from the tips of the fingers through a doctor. He sent them to fingerprint bureau along with the one authentic print of the suspected deceased available on his Will. The bureau confirmed the identity of the deceased. (CH)

It has not been possible to change the epidermal skin through surgery. Even if it becomes possible, it can be detected through scars or residual skin. It is also not possible to destroy the ridges by rubbing, cutting, or burning. These processes temporarily affect them, but when the wounds heal, the original pattern appears again. If the injury (or burn) is too deep, a scar replaces the ridges, but a new ridge pattern does not appear. In short, the destruction of epidermis and under layers alone destroys the pattern. Destruction may take place through disease, amputation, burning, or surgery.

The permanence of fingerprints permits the identification of an individual even after many years, in fact, as long as his fingers are not destroyed and his fingerprint record is available. Many criminals have been identified through this medium after years of absconding. It is nature's identity card given to each individual.

5.1.3 Universal

All individuals and hence, all criminals carry this medium of identification. The finger and toe digits and palmar surfaces of the hands and the feet carry the friction ridges. The fingers have more intricate patterns than other papillary surfaces. They allow easier individualisation and classification. A criminal uses his hands in the commission of the crime. He leaves marks at the scene of occurrence or on objects, which his hands touch. There are, therefore, fair chances of occurrence of fingerprints in all types of crimes. If a criminal wears gloves, no fingerprints are found at the scene. However, the population in India, especially the criminal community, does not wear gloves. They, therefore, leave fingerprints in most of the cases.

5.1.4 Inimitable

Successful forgeries of fingerprints have not been reported so far. Near perfect forgeries have been attempted. It is possible that the advancement of science may bring the forgery still closer to perfection, but a complete success in the enterprise is extremely difficult, if not impossible. The investigating officer, the expert, the court, and the lawyers, however, must guard against such possibilities, especially in view of the potentialities of the computer. They should make use of scientific tools, which will undoubtedly enable the expert to detect such frauds.

For all practical purposes, it is taken that it is not possible to forge a fingerprint. This is important because, then, no person can deny his or her fingerprints. The identification through properly recorded fingerprints, when made on adequate data, is certain and infallible.

5.1.5 Classifiable

The scope for the classification of fingerprints is large, and yet the work is simple. Records of millions of persons can be classified and kept and retrieved easily. Computerisation of fingerprint records, and hence their searches are becoming popular because the computers have increased the efficiency beyond imagination. Computerised records and computers have made the time and labour efficient exceedingly.

5.2 NATURE

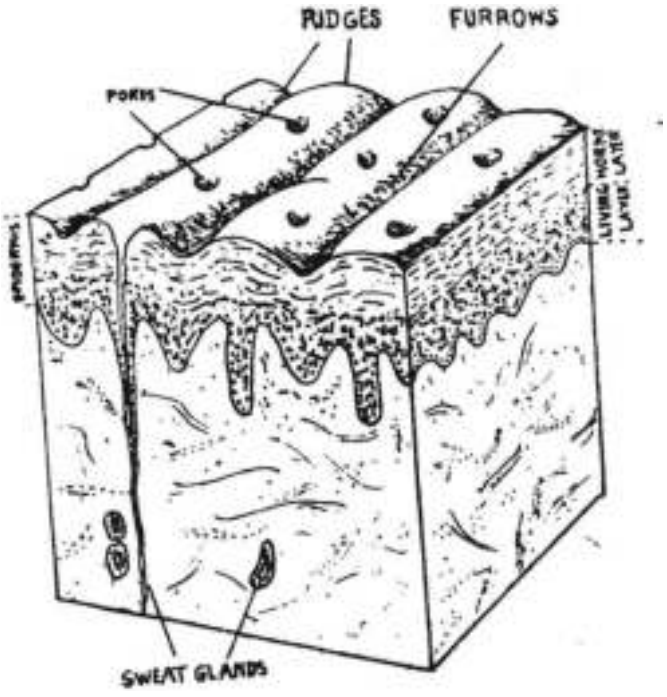

Fig. 5.2

Schematic view of palmar surface, illustrating the ridges, furrows, pores and the epidermal skin structure

Palmar surfaces of the hands and the soles of the feet have friction ridges. The ridges are the raised portions of skin between furrows on either side. They are also known as *papillary* or epidermal ridges. The ridges flow in various directions giving rise to innumerable patterns.

Fingerprints are the marks of these epidermal ridges. The term fingerprints include marks of these ridges from any part of the body (foot!) they have come.

The ridges have small pores, which exude perspiration, which is secretion of the eccrine gland in the ridges' skin. It spreads all over the hand surface. The evaporation of the perspiration concentrates its non-volatile constituents, notably, the common salt, oils, fats and the albumins. Some materials also come from the foreheads as human often touch or rub their foreheads and hairs.

Whenever the epidermis comes in contact with a surface, the above materials are left thereon in small quantities. The deposits take the pattern of the ridges. The marks left thereon are called latent prints. They are two-dimensional prints when the surface registering the mark is rigid. They can be developed to give visible prints. The rough and fibrous surfaces do not give decipherable patterns.

Visible prints are created when smeared hands or fingers with coloured powders or liquids come in contact with a smooth surface. They are called patent prints.

The fingerprint marks may be distinct impressions (three-dimensional marks) if the receiving surface is pliable such as butter, dust, putty, wet paint, mud, wet clay, kneaded flour, any semi-solid substance or warm wax (paraffin or sealing wax). They are called plastic prints.

Two-dimensional marks are technically prints, and three-dimensional marks are impressions. But both the terms are used interchangeably in the study of finger marks.

5.3 CLASSIFICATION

There are numerous ridges in a fingerprint. Their lengths, shapes, turnings, joining, bifurcations vary so extensively that the combinations of these variations are virtually infinite. Each finger of an individual has a pattern of its own. The patterns have been divided, for the purpose of classification, into categories based upon their general shapes. There are three major systems of classifications:

1. Henry System. It was developed in India and is used in most parts of the world.
2. Roschler System. It was developed in Germany and it is used there.
3. Vucetich System. It is used in South America.

Henry system is used in India. It classifies the fingerprints in the following classes:

5.3.1 Arches

The ridges are found in an **arch-like formation** in this pattern. When the height of the arch is small, the pattern is **plain arch**. If it is considerable, it is a **tented arch**. The pattern has no turned or twisted ridges nor does it have a delta, generally. The frequency of occurrence of arch patterns in the human population is about 5%.

5.3.2 Loops

In the loop pattern, one or more ridges form a loop by curving backwards. Consequently, there is a **delta** and a **core** in the pattern. Delta and core are known as fixed points of a pattern. They do not appear in some incomplete prints.

Loops are subdivided into **ulnar** and **radial** loops. The division is based on the flow of the ridges. If the ridges flow towards the ulna, the pattern is ulnar. If the ridges flow towards radius, the pattern is radial. The prints on paper, from right hand will be:

- **Ulnar;** here the ridge flow is from left to right (print 4, in Fig 6.4).
- **Radial;** here the ridge flow is from right to left (print 3, in Fig 6.4).

The direction of flow would be in the reverse order for ulnar and radial patterns in prints from left-hand fingers.

Loop patterns are the most frequent patterns in humans (in about 65%) of the population.

5.3.3 Whorls

Whorls are the simplest to identify. They have at least one ridge forming a complete circle or oval. Whorls have one or more cores and two deltas in complete patterns. They are found in about 35% of the human population.

5.3.4 Composites

The composites are combinations of any of the above-mentioned three patterns. Thus, the central pocket loop is a combination of a loop and a whorl, a double loop pattern has two loops. They form either a lateral pocket loop or a twinned Loop.

5.3.5 Accidentals

A pattern, which does not fall in the above classes, is considered accidental. Such a pattern usually has two or more of the above patterns and two or more deltas.

5.4 INDIVIDUAL FEATURES

The above classification of fingerprints divides the patterns into groups. It does not lead to individualisation of a print. The latter is possible through observation of the minute details, also known as ridge characteristics or minutiae. The following types of ridge characteristics (with their shapes, sizes and positions) make each pattern unique/individual.

1. ***Angle:*** It is the angle formed by two intersecting ridges.
2. ***Bifurcation:*** It is the splitting of a ridge into two ridges.
3. ***Break:*** It is a short gap in a ridge.
4. ***Core:*** It is the central point of a fingerprint. It helps to identify a fingerprint, as there are tremendous variations of the cores. It is also known as a fixed point of the pattern. The arch patterns have no chores.
5. ***Delta:*** It is the outer terminus of a pattern, formed by either bifurcation of a ridge, or by the widening of the two ridges, which were running almost parallel up to the point of the delta. The complete whorl and loop patterns have usually two and one deltas respectively.
6. ***Divergence:*** It is going apart of two ridges.
7. ***Dot:*** It is small dot-like raised epidermal skin.
8. ***Enclosure or Lake:*** It is an enclosed area along a ridge by another short curved ridge, connected to the longer ridge at both the ends.
9. ***Fragmentary ridges:*** It is a disjointed ridge — a sequence of rods (short ridges).
10. ***Focal Fixed point:*** *Delta* and core are the focal (fixed) points of a pattern.
11. ***Fork:*** It is the short ridge, which bifurcates from a ridge to form a tongue-like structure. It is also called **Tongue.**
12. ***Incipient ridge:*** It is malformed ridge, incomplete and thin, in between the normal ridges. The ridge may or may not appear in a pattern.
13. ***Pattern area:*** It is the area contained between two type lines.
14. ***Ridge Count:*** Ridge count is the number of ridges between:
    - Delta and delta
    - Delta and core point
    - Delta and any characteristic point
    - Any two characteristic points

    It is an easy checkpoint for possible match/non-match.
15. ***Ridge Tracing:*** It is ridge coursing in whorls, from lower left delta ridge to the right delta. If the tracing ridge meets the right delta:
    - Within two ridges, (less than two ridges above or below the delta), the pattern is 'M' (Meeting) type.
    - Above the delta by more than two ridges, it is 'I' (Inner) type.
    - Below the delta by more than two ridges, it is **'0'** (Outer) type.
16. ***Rod or short ridge:*** It is a short independent ridge.
17. ***Spur:*** It is a short appendage to a ridge.
18. ***Staple:*** It is the structure formed by two rods, joint at the top by a short ridge, at the centre of the pattern.

19. ***Termination:*** It is the free end of a ridge.
20. ***Tongue:*** It is the second name of the characteristic called fork (supra).
21. ***Trifurcation:*** It is a point where three ridges meet or from where a ridge trifurcates

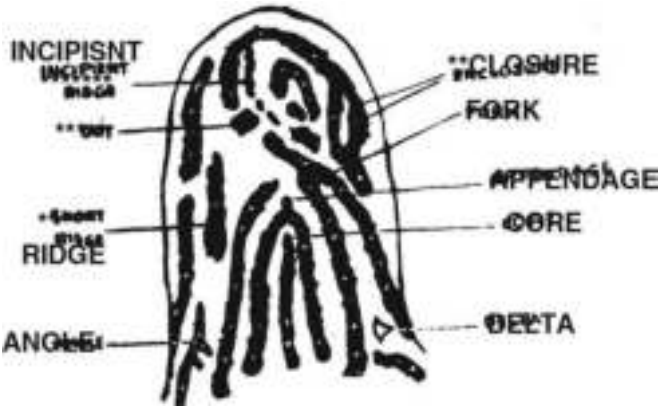

Fig. 5.4

Schematic illustration of some ridge characteristics used in fingerprint identification

5.5 LOCATION

A criminal touches many objects in the commission of a crime. They are likely to bear fingerprints. The investigating officer, while locating the fingerprints, in addition to the usual procedures, should:

1. Reconstruct the scene of occurrence mentally. Imagine himself in the role of the culprit and check the possible articles/sites, which he could have touched in the commission of the crime.

2. Leave no fingerprints of his fingers on the articles. Some persons recommend the use of gloves, to handle articles, to search fingerprints. They are not used usually. They hinder the manoeuvrability of the hands. Besides, they lead to complacency. The fingerprints on the articles handled may get mutilated. The articles are handled, therefore, from edges or from rough surfaces where it is not possible to develop the fingerprints.

3. Preserve other evidence. A fibre, a hair, a paint flake, a streak of blood, or semen stain may be covered by powders or chemicals and get lost if care is not taken while developing latent fingerprints.

4. Avoid inhaling powders and chemicals as all the powders and the chemicals are injurious to health, grey powder, iodine and osmium tetraoxide are especially so.

5. Photograph all visible and developed prints along with proper identification data chit and a scale.

5.5.1 Routes

The telltale prints may be found on the doors and windows, knobs and handles, glass panes, locks, touched by the culprit enroute. The windowsills, polished or dusty, also take up the prints and record the visit of the culprit to the place.

A police store (where case property was kept) was burgled. Fingerprints in the dust, were found deposited on some articles. The possible suspects were checked and the correct one identified. (CH)

Finger and palm prints, in blood, were found on a door and on an almirah in a murder case. The prints were compared with those of the suspects. They were correctly identified. The culprits were convicted in spite of the fact that there were no eyewitnesses. (CH)

5.5.2 Vehicles

The transport vehicles (cars, cycles, jeeps, etc.) are likely to bear prints of their occupants and drivers. The portions of the vehicles likely to come in contact with the hands are the outside surface: the door handles, the steering wheel, and the mirror.

In a famous dacoity case, the dacoits, after looting and killing escaped in a bus. They abandoned the bus later. Fingerprints were found and collected in large number from the vehicle. The fingerprint record was checked. It was possible to identify three of them. The rest of the work was simple. The whole gang was apprehended in a few days.

The fingerprint evidence later brought them convictions. (CH)

5.5.3 Scene of Occurrence

The richest source of fingerprints is the scene of occurrence. The culprit must touch or handle objects at the scene. The evidence should invariably be available if it is properly searched at the appropriate time, at the appropriate places. Boxes, furniture and leather, Rexene or plastic goods, such as purses, portfolios and bags should be carefully examined. Fingerprints are sometimes found on broken windowpanes, thrown away bottles, tumblers, furniture, and crockery.

Fingerprints in the blood are sometimes observed on furniture, walls, floor, windowpanes, cupboards and almirahs. They fix the actual scenes of crime, in cases where the culprit has tried to create a fake crime scene.

5.5.4 Bathrooms

The culprit may have visited the bathroom or a water closet. The places should be carefully searched.

> *A murder took place in a running train. The compartment was totally sealed and thoroughly searched for evidence. Fingerprints on washbasin tap handle and some other articles were discovered. After screening a large number of suspects the correct perpetrators were identified and convicted on fingerprint evidence. (CH)*

5.5.5 Utensils

If the culprits have taken food and drinks, the likely articles to carry fingerprints are refrigerators, tumblers, plates, saucers, bottles, cups, spoons and utensils. They, therefore, should be examined.

> *In a government loan case, the document bore a fingerprint impression. The fingerprint, along with the ten fingerprints of the suspect, was sent to the fingerprint bureau. The print on the document did not tally with the specimen fingerprints. However, from the size and pattern of the print the expert suspected it to be a toe print. On comparing the toe print of the suspect with the questioned print, the suspicion was confirmed and the culprit identified. (CH)*

5.5.6 Leftover Objects

The culprit sometimes leaves objects like shoes, papers, tools, weapons of offence, torch or lantern at the scene of occurrence accidentally or otherwise. He may desert his conveyance on his way to or from the scene. These objects have excellent chances of bearing fingerprints.

A few years ago, fingerprints of the culprit were discovered on the inside of the back of a watch left at the scene of occurrence. (CH)

In a poisoning case, the bottle containing the poison (found near the deceased) was checked for fingerprints. It was possible to identify the correct culprit, from the partial prints available on the bottle, from a number of suspects. (CH)

In an arson case, the fingerprints were discovered on a bottle of kerosene oil found at the scene of occurrence. They were compared with the fingerprints of several suspects. The correct arsonist was identified. (CH)

In another interesting case, the culprit was searching the pockets of the victim with blood smeared hands. He happened to touch a piece of paper in the pocket of the victim. He left a faint print in blood on the paper. The piece of paper got conviction to the culprit. (CH)

5.5.7 Documents

Fingerprints should be found on anonymous and pseudonymous letters containing abusive or indecent language, threats or complaints. Ordinarily, it is not possible to locate these prints. This is due to the carelessness of the addressees or the investigating officers. Such documents should be handled only when absolutely essential.

5.5.8 Dead Bodies

In infanticides, the fingerprints are discovered on the body of the infant. The greasy mass, with which the body of the infant is covered at the time of birth, retains the prints. Relatively recent experiments and researches have indicated that it is possible to develop fingerprints on dead human skin. This will help in identifying the culprits in offences against persons. It will be particularly helpful in cases of rape with murder or murders by manual strangulation. It was not possible to develop fingerprints on the skin previously but now the following technique gives success in some cases:

1. Fuming with cyanoacrylate ester, with or without pre-treatment
2. Lead dusting followed by X-ray radiograph
3. Magnetic powders
4. Iodine fuming

The developed prints are photographed. Lifting by usual means may follow. The places of interest to locate the fingerprints are the neck, breasts, thighs, wrists, and ankles.

5.5.9 Search

A search for fingerprints should be systematic. The area suspected to bear fingerprints should be thoroughly checked. The surfaces are examined with oblique lighting (light is thrown at an angle). It is desirable to avoid diffused light. A semi-dark place is preferable.

Most of the prints (visible, plastic, and latent) are located in this way. Other appropriate developing agents discover prints on semi-glazed or unglazed paper, documents, currency notes, raw wood, cloth, leather and coloured surfaces.

A magnifying lens is not only helpful in locating the prints, but it is also useful to judge the quality of the fingerprints.

The use of Polylight (brand name) system is quite convenient for searching fingerprints. Polylight gives radiation, in strong beams, from UV to IR range. They reveal the fingerprints in many a case.

The polylight system is portable. It can be used at the scene or elsewhere. The lighting system is available under numerous other brand names.

5.5.10 Development Techniques

The commonly used techniques to develop latent fingerprints are:

5.5.10.1 Powder Development

Powders are an excellent medium to develop latent prints on small surfaces, in competent hands. They fail only in case of old prints and prints on rough surfaces.

The powders of all shades and varieties have been used. However, the following powders meet most of the situations in fingerprint development:—

- The grey powder is used for all dark coloured surfaces.
- The black powder is used against a light background.
- The fluorescent (anthracene) powder is used for multi-coloured surfaces. Fingerprints developed by anthracene are exposed to ultraviolet rays and photographed. The prints developed with fluorescent powders need reversals, that is, the prints are prepared from the transparencies.
- Metallic powder (aluminium, copper, brass, gold, antimony) and universal powder are also used in special situations. The metallic or universal powders are useful for fingerprints on sticky surfaces.
- The use of magnetic powders with Magna Brush facilitates developing fingerprints on large areas.

The powder used should be amorphous, dry and of uniform consistency of flour. It should be stable, somewhat sticky and chemically non-reactive (inert). Fingerprint powders are available commercially. They are purchased from reliable dealers.

The powdering techniques are simple, yet they need experience. In the hands of a novice, they may mutilate the prints. Only experienced and qualified operators, therefore, should handle the prints in crime situations.

Powdering is done with a camel hair brush, usually. Atomisers and automatic fingerprints powder spray devices are being used increasingly. The new devices save time and reduce the human factor in the work.

The automatic sprayer is a boon where extensive searches are required. Likewise, Magna Brush with magnetic powders is useful where large areas are involved. The method is quick and almost automatic.

5.5.10.2 Chemical Methods

The perspiration materials (sodium chloride, amino acids, and oils) deposited by the fingers, are utilised to develop the latent prints by chemicals methods.

- Sodium chloride when treated with silver nitrate solution gives silver chloride, which is insoluble. It ultimately gives black colour on exposure to light.
- Amino acids react with ninhydrin to give pink colour.
- Oils and fats in the deposited residue reduce osmium tetra oxide to osmium, which is black in colour.

The oils and fats from the perspiration adsorb iodine preferentially and develop the latent fingerprints.

5.5.10.3 Wet Methods for Latent Prints

The following wet methods are in current use:

1. The **Wet Powder** method has been tested and used at many crime scenes by the Kyoto Prefectural Police. The fingerprint powder suspension, employed in this method, is prepared in this way:

   The fingerprint powder is a mixture of aluminium powder 20%; pollen of lycopod 70%; and hignum powder 10%. The latter is aluminium powder containing 1% of an antiseptic agent. It is suspended in liquid mixture of dimethyl ether 15%, dimethyl acetone 80%, and ethyl alcohol 5%.

   Just before using, put 10 grams of the fingerprint powder in 100 millilitres of the liquid. Mix it well and place it in a spray bottle and gently spray on objects from a distance of 40 centimetres.

   When spraying a large area, shake the container periodically to keep the powders in proper suspension.

   Allow sprayed objects to dry at room temperature and then brush the surface with a camel hair brush to obtain the best results. Lift the developed print with gelatin paper (like the opaque rubber lifters used in the USA).

   The mixture remains effective for only about two hours after preparation. Discard any remaining mixture in the bottle after use.

2. The **Diazoflourine Method** is a comparatively recent development. The method is far more effective on paper for latent prints than the ninhydrin method. It reacts with the amino acids in perspiration to give fluorescent prints.

   Dissolve the chemical in an organic solvent mixture, containing 4% methanol and 2% acetic acid. Dip the exhibit bearing the latent in the solution for 5 seconds. Take it out, dry it (1/2 a minute) and observe the print(s). If the print(s) is not developed, repeat the dipping/drying processes till the print(s) appears.

5.5.10.4 Fuming Techniques

A number of fuming techniques are known. The following ones are in current use:—

- ***Iodine Fuming***

  Iodine fuming develops fingerprints on most of the surfaces, but the process is more tedious, troublesome and in certain cases less satisfactory. It is used only where powder methods are not successful for prints on paper, starched clothes, raw wood and leather.

There is no chemical reaction between the print material and the iodine. It gets adsorbed on the outline of ridges preferentially due to the presence of oils to give brownish tinge. As it is volatile at ordinary temperature, it gets evaporated in due course, leaving the surface in the original condition, theoretically, only; some staining always remains. The surface can subsequently be treated with powders or chemical for development. This advantage makes iodine fuming an ideal tool to locate latent prints. It is consequently often used as such in spite of certain disadvantages.

The technique requires a fuming tube filled with iodine and calcium chloride separated and held in position with glass wool. Simple blowing through the tube evaporates iodine, which gets deposited on the surface exposed to the fumes.

Fuming is also carried out in a fuming cupboard or fuming chamber. Iodine is heated in a dish, and the exhibit is exposed to the fumes.

Iodine fuming locates sometimes even old latent prints on paper.

- ***Cyanoacrylate Fuming***

  Cyanoacrylate ester in an effective chemical to develop prints on skin, fabrics, plastics, and surfaces where powders cannot be used due to stickiness of the surface or for some other reasons.

  The exhibit bearing the latent print, if it is small, is kept in a closed container containing cyanoacrylate. If the interiors of cars or rooms are to be searched for latent fingerprints, an appropriate amount of the chemical is kept in the closed place and left closed for about 12 hours.

  The cyanoacrylate fluid is kept in a closed pouch, which is opened and kept in the closed container with the exhibit, or in the car or room. The fumes react with the perspiration materials and produce chalky white prints, which can be photographed or lifted on an adhesive tape. The cyanoacrylate fuming has been used successfully to develop and identify a rapist from his fingerprints on pillion cover. A drug peddler was identified from his fingerprints on a plastic pouch.

- ***Metallic Vapour Fuming***

  The usual methods to develop latent fingerprints do not work well on plastics and polythene surfaces sometimes. Metallic vapour fuming, as an additional technique, has been developed for the purpose. However, it is successful only when the prints on polythene (even of low density) are fresh.

  The metals used are gold, zinc, and metal alloys. They are evaporated in a heated chamber, in a vacuum. The vapours get deposited on the exhibit. They reveal the prints.

5.5.10.5 Laser Development

The use of laser in the location, development and collection of latent fingerprints has given dramatic results. The fingerprints fluoresce under the lasers. The laser rays have been used to locate and develop fingerprint on the following surfaces:

5.5.10.5.1 Paper

Fingerprints on paper, as old as 40 years, have been developed with the lasers.

> *In a dramatic case, a Nazi war criminal was identified through fingerprints developed by lasers. The fingerprints were 40 years old. The Nazi after committing war crimes, and responsible for numerous killings of Jews, had entered America and there had joined the clergy. At the time of detection he was already a Bishop of Roman Catholic Church, of course with a false and changed identity, now a naturalised citizen of USA.*
>
> *The USA detected concealment of the real identity. The proceedings of extradition went on for nine years when his false identity was proved through a latent fingerprint found on a document in the German archives. The document, which helped to his real identity was a postcard dated 14-6-1941, addressed to Himmler, one of the closest associates of Hitler. The Nazi denied authorship of the document, which was highly incriminating. The left thumb impression, not only established his authorship but also the real identity of the war criminal. (CH)*

5.5.10.5.2 Metals

5.5.10.5.3 Plastics

5.5.10.5.4 Glass

5.5.10.5.5 Skin of the living/dead persons

The main advantages of the laser detection/development techniques are:

1. It can develop/reveal old prints.
2. It needs no pre-treatment of the print/surface.
3. They do not stain/soil/damage/affect the print bearing surface in any way.
4. They can be used even after some conventional methods for the development has been tried. In fact, some methods enhance the chances of success with lasers. For example, prior use of fluorescent powders, ninhydrin, and cyanoacrylate give better fluorescent images with laser, even with faint marks.

   The main disadvantage of the use of the laser was that the equipment was rather heavy. It was not convenient to carry it to the crime scenes. Comparatively recent developments and research have reduced the weight. It is being used at the crime scene by some police forces, abroad.

The background surface affects the luminescence generated in the fingerprint. In fact, the surface has a predominant effect on the success or failure of the method.

The Laser technique is simple. It involves:

1. The suspected surface/print is exposed to lasers.
2. The prints, made visible, are observed. Safety goggles are used to cut off the harmful laser rays to the eyes.
3. The revealed print(s) is photographed using a filter to cut off the laser rays.

An area bearing about three sequential prints can be examined under the lasers in one go.

The following types of lasers have been used:—

1. Argon Ion laser.
2. Copper Vapour laser.
3. Neodymium Yttrium Aluminum Garnet laser.

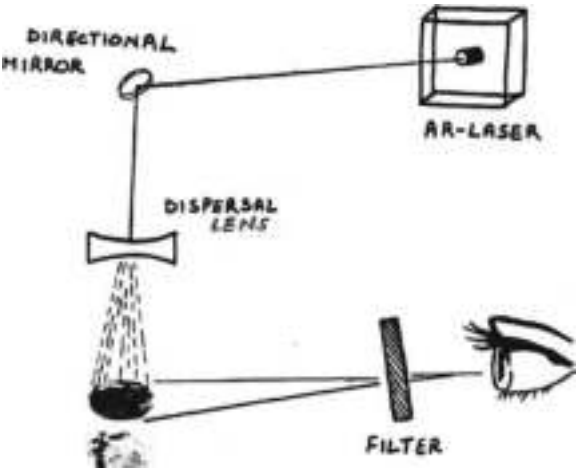

Fig. 5.5

The schematic laser arrangement for latent print detection

5.6 COLLECTION

In India, fingerprint experts collect fingerprint evidence. It is done by the fingerprint proficient, posted in each district to collect fingerprints of the convicts. Alternatively, he is part of the crime scene team. He is trained to collect the latent and other fingerprints from the crime scene.

The collection of fingerprints varies according to the nature of the evidence, the surface, and the place at which they are available.

5.6.1 Articles

One should collect the evidence on a portable article by collecting the article itself. Mutilation of the prints or breakage of the particles is prevented by proper and careful packing. Ready-made board with-holes, nuts and bolts are provided in the investigation kits for the purpose. They can also be improvised. Rubber, leather, and cork washers are used frequently to keep the article in position. Proper packing ensures that:

1. The print-bearing surface does not come in contact with the container or other surfaces of the object or objects.
2. The object does not collide or rattle with the packing material, with other parts of the same object or with the contents of the object.
3. The contents do not seep, spill, or fall out of the container bearing prints. They are either properly corked or preferably the contents are taken out.
4. The packet is sealed in such a way that the contents cannot be taken out of the packet without breaking the seal. The seals should be legible and it should not be possible to remove the same, by peeling off the sealing wax.

5.6.2 Photography

Prints are photographed in all cases, wherever possible. Photographs record the prints permanently. In case of damage to the original article, they prove useful evidence.

The latent prints are made more conspicuous by oblique lighting and shading the surface from diffused light. Three photographs, one showing the questioned object in its surroundings, the second, showing the print on the object and the third, close-up photograph, containing the details of the prints are taken. While taking photographs of the fingerprints one should:

1. Prepare negative of the same size or of a smaller size than the print on the object.
2. Manage to keep the fingerprints darker than the background. This is achieved by providing a background of lighter shade in case the print is found on colourless transparent objects. In other cases, powder of a darker shade than the background is chosen.
3. Photograph those latent prints at the scene of the crime, which cannot be photographed in the daylight, at night.
4. Use a digital camera for photography and check each snap immediately after clicking. Delete those, which are not clear. Retake the shot.
5. Use colour filters to increase the contrast. A set of about ten main shades meets most of the situations. Choose the filter after a visual trial.
6. Keep a scale and an identification chit along with the print, while taking photographs.

A 'fingerprint camera' that takes up 1:1 photograph was being used by some police forces in olden days. It is no longer used.

5.6.3 Lifts

Fingerprints in the dust or those developed with powders are generally lifted. The process of lifting is simple: a tacky tape is pressed against the print. The dust or powder is picked up by its surface, forming the original pattern thereon. A second or even a third lifting is sometimes possible. But as the quality and clarity of subsequent lifts go on deteriorating, one should ensure a proper lift in the first attempt.

Lifting appears to be the most convenient technique to collect fingerprints. It does not require any photographic or other equipment. However, fingerprint experts do not encourage lifting. The process is recommended only where the collection of the original article or the photography of the print is not possible. The reasons advanced are:

1. The lift does not give the nature of the background. Defendants frequently allege that the lifts have been obtained from the utensils or vessels used by the accused in jail and falsely shown that they were recovered from the scene.
2. The lift may not pick up all the details available due to defects in the lifter or in the lifting process. For example, air bubbles or excessive pressure in the lifting damages the ridge details.
3. Light pressure on the other hand may give incomplete details.
4. The lifts deteriorate with the passage of time. The print may, thus, lose the details.

The arguments against lifting are substantial, but not prohibitive. However, the use of lifters is not frequent because photography cannot be dispensed with. There are a few situations where lifting proves superior to photography:

1. A fingerprint on the curved surface is not adequately covered by photography. Lifting gives better evidence on a flattened surface, though a periphery camera can photograph prints on the curved surfaces.
2. Multi-coloured background surfaces interfere with the photography of the prints. It does notaffect lifting.

3. Photography of prints on polished surfaces is difficult due to reflection. The reflexion has no effect on lifting.
4. If a print is found on a fractured surface (say of glass), fractures interfere with the photography. Lifting is not affected so much.

Lifting is an important and convenient technique in the collection and preservation of fingerprints. While lifting fingerprints one should:

1. Use a lifter of good quality only. There are rubber lifters, transparent tapes, Acetabs and Folien paper. Seek guidance from the fingerprint bureau for the latest and best materials.
2. Lift only properly developed prints. Excessive powder on the prints and incompletely developed prints do not give good lifts.
3. Lift prints developed with powder, which does not contain chalk. Chalk reacts with the tacky material and spoils the print in due course. Use black powders, whenever possible.
4. Allow only an experienced person to lift the evidence prints.
5. Photograph the print to show the location of the print, with and without lift preferably with an identification chit.
6. Do not introduce your own fingerprints on the lifter.

5.6.3.1 Techniques

For proper lifting, one should:

- Take a piece of the lifter of a suitable size.
- Peel off the protective film/sheet.
- Stick one edge of the piece near one end the print.
- Press the piece over the print bearing surface gradually and uniformly starting from the struck end with the bulb of an index finger.
- Lift the piece by peeling off, starting slowly from one comer.
- Cover the lift with a protective transparent thin film of fold the tape to sandwich the lifted print.

5.6.4 Plastic Print

Casting is used to preserve/collect plastic prints sometimes. The common casting material is a cellulose acetate solution. The casting techniques are substantially similar to those used for footprints and tool marks.

5.6.5 Fingerprints from Dead Bodies

The fingerprints of all unidentified dead bodies are taken because their fingerprints may lead to their identification. The problems of collection of prints from dead bodies vary under different situations:

- If the death has taken place just a short time ago, the prints are taken in the way they are obtained from the living persons.
- If the body is in *rigor mortis* (*i.e.*, the body is stiff) the muscles are loosened by vigorous exercise. If the same proves ineffective, the tendons are cut and fingerprints are taken in the usual way.

- If the body was mummified, the digital skin gets shrunk, it is brought to normal condition by immersing it in 3% solution of caustic potash (Potassium hydroxide), till it regains the original form. It is then washed with water and fingerprints are taken. The digital skin can be preserved in formalin.
- In some cases the friction ridges wear off from the surface of the hand, in buried corpses. They remain on the inner side of the skin. The digital skin is removed and photographed.

5.6.6 Fingerprints in Dust

Fingerprints and footprints (naked, or even footwear marks) are found in dust, deposited on the smooth surface. Theoretically, they are plastic prints but the dust layer is so thin that it needs different treatment for lifting. An electrostatic method has been developed.

The method involves a rubber plastic sheet or film, which is kept over the print. An aluminium foil covers the upper surface. High voltage is applied to the Aluminium sheet. The high voltage picks up the dust particles, and they get attached to the rubber sheet creating the pattern existing in the dust on the original surface. The lifted prints should be photographed and the lift preserved as such.

The main advantage of lifting over photography is that the background surface does not interfere and the appropriate shade of the aluminium sheet can increase the contrast between the lifted prints and the background surface of the sheet.

Large areas of the suspect surface can be covered on one sheet and a number of impressions can be lifted in one go. They can be studied conveniently at the fingerprint bureau.

5.6.7 Laser Fluorescent Print collection

The latent prints are made fluorescent with appropriate lasers and developers. They are photographed in the normal way.

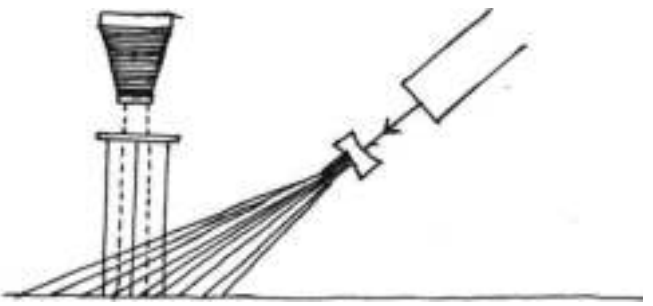

Fig. 5.6

Lasers make latent fingerprints fluorescent. They are photographed

5.6.8 Specimen Prints

Exemplar prints can be collected using Live Scan or by using ink on paper cards.

Fig. 5.7
A sensor imaging print

Fig. 5.8
Friction ridges on human finger

Specimen prints are taken on specially prepared cards for record purpose. The NCRB has designed a fingerprint card. The bureaus in the country are using the same. Fingerprint recording work is simple. It can be mastered by any person in a short while. Police have trained proficient' s for the purpose.

5.6.8.1 Technique

Fingerprint ink, a slab, 10 x 20 cm (made of glass or metal), a roller, 10 cm long and about 3 cm in diameter (made of rubber) and fingerprint cards are the only requirements. Glazed, semi-glazed or even ordinary paper can replace the cards.

An even thin layer of ink is spread over the plate (slab), by rolling ink over the slab with the roller. Each finger is rolled once on the inked surface from one side end of the nail to the other end and then on the card or paper in the allotted space on the card. For plain impressions of all the fingers, the bulbs of the fingers are pressed moderately first on the slab and then similarly on the paper.

Recently a rubber slab and a metal (brass) roller have been suggested. The inking is done by the roller. It is claimed to distribute the ink more uniformly.

5.6.8.2 Precautions

While collecting and sending specimen fingerprints one should:

1. Send only clear and complete fingerprints for examination. The fingerprints are obtained only if the fingers and the apparatus are clean, and inking is proper. The cleaning is done usually with spirit, petrol, or kerosene oil.
2. Let the subject relax his fingers and hands. The operator does the printing.
3. Give a note relating to missing, cut, additional or injured fingers at the appropriate place. If there is an additional finger, its print is obtained.
4. When a chance print is discovered at the scene of occurrence, send specimen prints of the household, the investigating staff and of the other persons who could leave the print there along with the prints of the suspects on fingerprint forms. Plain paper, if forms are not available, may be used.

A scanner to scan finger to get specimen prints has also come up. It is not yet being used in India to any extent.

Collection of fingerprints is the most crucial part in the comparison and evaluation of fingerprints, especially in automatic computer comparison mode. Proper image of the print facilitates the evaluation. A poor image may mislead the experts.

Two types of image acquisition apparatuses have come up. They measure and compare the spaces between the ridges (and furrows) and their shapes.

One type of instrument uses optical readers, and the second type uses solid-state readers. They determine the physical differences between the ridges and the furrows through sensors from the mark bearing surface of the finger.

The finger surface is elastic. Varying pressure and direction give non-uniform images of the same finger. The mode of collecting the specimens from fingers is, therefore, crucial. An apparatus that records the print without physical contact with the finger has been proposed, and the work is going on.

5.7 SINGLE DIGIT SYSTEM

A criminal seldom leaves a complete set of fingerprints at the scene of the crime. Instead, one may find prints from one, two or three fingers of a criminal. It is well-nigh impossible to establish the identity of the criminal from these prints by a search of the ten fingerprint record files. In rare cases, the search may prove fruitful, but then it takes weeks.

There was, therefore, a definite need for a classification system which could permit the identification of a chance print. Several fingerprint experts attempted such a classification. Battley developed a system for single fingerprints. It is known as the Single Digit System.

In Single Digit System, single fingerprints fingers are numbered 1 to 10 and their prints are collected in ten separate collections. The first five are from the right hand, in the order: thumb (1), index finger (2), middle finger (3), ring finger (4) and little finger (5). The collections six to ten relate to left-hand fingers in the same order.

Each of these ten collections is sub-divided on the basis of patterns. Thus ten sub-divisions are obtained: plain arches, tented arches, radial loops, ulnar loops, whorls, twinned loops, lateral pocket loops, composites, accidentals, and scarred prints.

These sub-divisions are further sub-classified, on the basis of core and delta formations, ridge counting and ridge tracing. Battley devised a special magnifying glass with concentric circles. The device is useful in sub-classification and evaluation of the fingerprints.

The single digit fingerprint files of all the convicted criminals are maintained. On the conviction of a person, two extra fingerprint slips are prepared and sent to the single digit fingerprint record officer who maintains the collections after classification.

If a chance print is discovered at the scene of occurrence, the article bearing the print is sent to the officer-in-charge of the single digit fingerprint records. In case, the chance print is found on the non-portable article, a fingerprint expert is called to the scene of occurrence. He photographs or lifts the print.

The chance print is then checked with the record. Sometimes it is possible to know the identity of criminal soon after the occurrence and the criminal is arrested before he disposes off the incriminating evidence.

Automation in recording and comparing fingerprints has made the single digit system redundant.

5.8 COMPUTERS IN FINGERPRINTS

Management of fingerprint records was an uphill task. The searches of the fingerprint corresponding to the given print were doubly so and sheer drudgery. Both the tasks were labour/time/cost-intensive. The computer has changed the situation completely. The fingerprints are now digitised. The digitised data of millions of fingerprints are filed systematically and stored automatically for easy retrieval. The computer itself creates the data relating to the new fingerprint, to be searched and compared, and compares the same with the stored data. It comes up with the possible source(s) of the new print if it exists in the stored record, in a short time!

The entry of a new fingerprint and deletion of an old unwanted file is equally easy. Computer scanning and digitisation of the fingerprint patterns involve:

1. Segmentation.
2. Feature extraction.
3. Comparison of fingerprints' digitised data *inter se.*
4. Image enhancement.
6. Ridge restoration.

The computers are now carrying out all these functions. The time taken for the searches has been reduced drastically. The expert verifies the final computer match or possible matches of the given suspects or victims.

The computer system, in India, is under the control of the National Crime Record Bureau **(NCRB)**, Ministry of Home Affairs, Government of India, has been termed as Fingerprints Analysis Criminal Tracing System (FACTS). The names of systems vary in different countries. But basic process is the same. The FACTS system of India provides a search system for both types of fingerprint records:

1. Ten digit system.
2. The single-digit system.

In the ten-digit system, an expert scrutinises the fingerprint on the fingerprint slip. Fingerprints of adequate quality are fed into the computer. The computer scans the prints and records two scans:

1. Preview scan.
2. Detailed scan.

The data obtained by the scanner is then matched with the already stored data and the computer gives a shortlist of the possible match(es) that are verified by a fingerprint expert.

In some cases, the computer may indicate 'No Match' or 'Data insufficient or improper'. In the latter case, the print can be resubmitted by modifying the search parameters, if there has been some error in defining the parameters earlier.

The computer system utilises the minutiae, the ridge characteristics known as ridge ending or ridge bifurcation. The characteristics identified through:

1. Co-ordinates.
2. Noting the flow of the ridge.
3. Inter-spaces between the ridges.

For the identification of a print, about eighty ridge characteristics (minutiae) are chosen from each of the print in the central digital data collection. A match is, however, made when about twenty-four minutiae correspond. A search takes about fifteen minutes.

Usually the Fingerprint Record is digitised with the following parameters:

1. Probable digit number.
2. Print orientation (if understood).
3. Definite (or probable) pattern class (if deciphered).
4. Core/Delta position.
5. Search Area (top, bottom, right half, left half, central, etc.), if known.

When a new print is to be matched, the data from the print is collected in the above-mentioned parameters and fed into the computer. On command, the computer compares the data already in store relating to the minutiae segment-wise, along with the above parameters. The shortlisted prints, in order of decreasing probability, appear on the screen along with the new print. A hard copy of the prints is obtained, and a fingerprint operator studies the prints to make the final identification. The comparison and the verification can be done on the screen itself.

The identification of a chance or other print is based on correspondence found in the minutiae; the computer produces the shortlisted matching fingerprints in descending order of probability. An expert checks the shortlisted images. The fingerprints matching data is also linked with the data available with the police forces — the photograph of the person along with his *modus operandi* and criminal record is verified. They facilitate the investigating work of the investigation.

The matching speed of the computer is very high. It depends, of course, upon the total data to be scanned. It can make about 500 matches per second in single-digit system if the data record relates to about one-fourth of a million prints. The match is often possible with about twenty-four clear characteristics. Continued research is making extensive improvement in the instrument. Keeping in view the utility, the instrument is not expensive. The instrument can allow identification of even partial prints. New filing and deletion of the unwanted record are still easier. The speed and surety reduce the burden on the experts who can devote their time and energy usefully elsewhere. The labour saved and the speed of the computer evaluation of the fingerprints has made the process indispensable.

5.9 EVALUATION

The problem of evaluation is not difficult at all when complete and clear questioned, and specimen fingerprints are available. However, in many cases clear and complete prints are not

available. The pattern of the print, core and delta formations, ridge counting, ridge tracing, and other characteristics are studied. If there is identity in all respects, the prints are said to have originated from the same source. If some dissimilarity exists, they should be explicable. For example, there can be differences due to cuts, scars, injuries and intentional tampering of the patterns. Or, they may be caused by the presence of foreign matter on the surfaces (on which the prints were left), on the fingers or in the material (fingerprint ink) with which the prints were obtained.

The problem of identification is difficult in incomplete, smudged or imperfect prints. The experts of various bureaus in the world are not unanimous as to what constitutes 'sufficient evidence'. Some experts believe that there should be at least twelve points of similarities before the common source of the prints can be identified, while others have based identifications sometimes on six points only. It is, in fact, difficult to lay any hard and fast rule on the subject. Some peculiar or rare ridge characteristics may give sufficient evidence with six points only in some cases while in others the usual or common type of six ridge characteristics may be considered insufficient to permit the identification of the common source.

When the experts find fewer points of similarities (without of course any discordances) they should consider probability figures based upon the incidence of occurrence of these ridge characteristics.

An expert sometimes finds it difficult to evaluate whether a given print is a forged print or a real one, especially when he has inadequate equipment at the site. A strong source of the spotlight, polylight, a stereomicroscope and a micrometre eyepiece prove useful in the identification of forgery in most of the cases.

Fingerprint experts evaluate evidence ordinarily with the help of a magnifying glass or by photographic enlargements. However, instruments like dactyl scope and Projectina can be used with advantage. They expedite and facilitate the work of the experts. Battley's magnifying glass with a reading disc is also helpful in the evaluation of fingerprints.

Instrumental aids have come to the rescue of the fingerprints expert, to reduce his drudgery; in addition to comparison microscopes, the digital camera and computer have changed the whole scenario.

The crime and specimen prints images can be studied side by side in magnified form and can also be superimposed over each other. The contrast and colour can be changed. Therefore, if the specimen print has been taken in the corresponding configuration to that the crime print, the evaluation can be carried out easily and quickly. The computers, in addition, are being used for automatic evaluations.

The computer has brought real revolution in fingerprint evaluations.

Filing and searching of fingerprints cards of the criminals are based upon the classification system used by a bureau. The discussion on it is of interest to the experts who are working the system only. It is, therefore, not discussed here.

Evaluation of erased, altered, obliterated, and superimposed fingerprints is sometimes required. These aspects of fingerprints are better handled by a forensic science laboratory and should, therefore, be referred to those quarters.

One high court has directed the investigating officers that the physical evidence collected from the scene of occurrence should be sent to the relevant experts immediately. The recovered evidence, therefore, should be dispatched direct from the scene of the occurrence to the laboratories whenever possible. Otherwise, the reasons for the delay should be given.

5.10 PRESENTATION

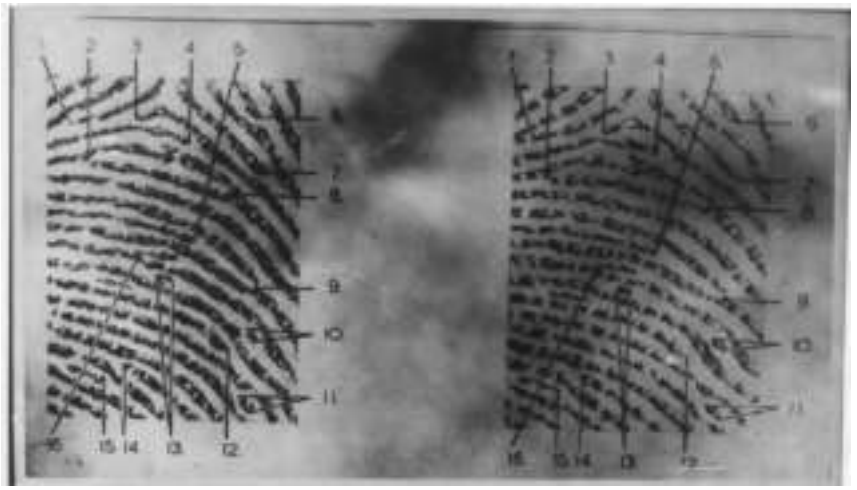

Fig. 5.9

An ideal comparison chart establishing identity of the common source of the specimen print and the print collected from the scene

The ideal presentation of fingerprint evidence is to produce the evidence illustrated with photographic charts of questioned and specimen prints pasted side by side, prominent points of similarities indicated thereon by drawing lines and giving corresponding numbers and explanatory notes given in the margin. This is desirable in view of the fact that the courts feel that they are to 'form their own opinion' from the data presented. However, this is not always possible in all cases due to heavy load of work with the bureaus; or additional expense.

Photographs are indispensable for proper presentation if the *ipse dixit* of the experts is not to be accepted. A probable opinion needs more elaboration and photographic illustrations, photographs and extensive notes. Only then, the relative value of a particular ridge characteristic can be appreciated for appropriate weightage by the court. Whenever possible, the probability value for each point based upon actual experience and research are given.

When evaluating the expert evidence it is seldom worthwhile to doubt the identification of fingerprints given by an honest and experienced expert. However, it is worthwhile to see:

1. Whether the expert is a *bona fide* expert or an imposter; his reputation for honesty reveals the same.
2. Whether the accused, who has been identified through fingerprint, had legal (or otherwise) access to the article on which the fingerprints were discovered. If so, can he show to have left the prints in circumstances other than the commission of a crime?
3. Whether the correct legal procedure has been followed in the collection of the fingerprints.
4. Whether independent witnesses have signed the recovery memorandum.
5. Whether the investigating officer and the witnesses identify the article, bearing the prints, allegedly recovered from the scene.

6. Whether the chain of custody of the objects carrying the evidence is intact; or, is there some period during locating, collecting, packing, sealing, storing and dispatching for which the custody of the article is not known?
7. Whether the specimen prints have been taken in the presence of competent authority and properly witnessed and identified.
8. Whether the marks identified are clear or not.
9. Whether the identification is based on generally accepted standards or not.

Unfortunately, there is a tendency among private experts to give evidence even on insufficient data in favour of their clients. The courts have to check that the expert has not done so.

5.11 LEGAL ASPECTS

5.11.1 Specimens and the Constitution

It was previously contended that if an accused is forced to give his fingerprints, it is equivalent to compel him to be a witness against himself. This is against Article 20(3) of the Indian Constitution, which provides that "*no person, accused of any offence, shall be compelled, to be a witness against himself*".

Cases were rejected by the high courts' on the plea that taking of fingerprints against the will of the accused amounted to compel him to be a witness against himself. Ultimately, the Supreme Court considered this matter in one case.[1] A Bench of seventeen-judges has decided that taking of fingerprints even against the wishes of the accused person is not against the Constitution. The controversy is thus settled.

5.11.2 Authorities

The Identification of Prisoners' Act specifies, in its section 4, the authorities who can take fingerprints:

1. Section 4 of the Act permits a police officer of the rank of sub-inspector or an investigating officer (in offences covered by Chapter XIV of the Code of Criminal Procedure, 1973) above this rank to fingerprint an accused, arrested for an offence punishable with at least one year's rigorous imprisonment.
2. **Under sections 4 and 6** of the Act, a first class magistrate can direct any person to be fingerprinted, if in the opinion of the magistrate, it will expedite the investigation of the case. **All means to collect the specimen can be used.**
3. **Section 73** of the Evidence Act also covers fingerprinting. The court may direct any person present in the court to give his fingerprints, if the same is required for comparison with questioned fingerprint by the court.
4. Section 311 of the Cr CP, 1973.

5.11.3 Fingerprint Experts

The evidence of a fingerprint expert, a person especially skilled in fingerprints, is considered relevant evidence by virtue of section 45 of the Indian Evidence Act.

1. *The State Of Bombay v Kathi Kalu,* 1961 AIR 1808 : 1962 SCR (3) 10.

5.11.4 Fingerprints Reports

In view of the general recognition of the individuality of fingerprints, the Code of Criminal Procedure has been modified. The report of the director of a fingerprint bureau is accepted as evidence, without his attendance, like the report of a chemical examiner, under section 293 of Code of Criminal Procedure, 1973. The court may call the expert for evidence, if it so decides.

5.12 MISCELLANEOUS

5.12.1 Palm and Sole Prints

The surface of the hand, fingers, toes and the soles of the feet bear friction ridges, like fingers. They are not as complex. There is generally no classified record. Individual prints are compared/identified in each case.

The best method of taking specimen palm prints is to make use of a wooden block having a curved upper surface. Half of the curve is covered with an aluminium or copper plate, which is inked in the same way as in taking fingerprints. The second half of the curved surface is covered with a piece of white paper on which palm prints are to be recorded. The hand is pressed lightly against the inked plate and then against the paper. The fingers are spread out somewhat and pressure is applied against the knuckles and the wrist. This is accomplished if the operator presses his hand across the hand which is being printed. Air pillows are also used for the purpose.

Sole prints of children, born in a hospital, are used, sometimes, for their identification. They do not carry much ridge details. Usually, dimensions, crease marks, and phalange marks are utilised for identification purposes.

5.12.2 Poroscopy

It is the study of pores, present on the friction ridges of the palmar surface of the human body, for personal identification.

Pores are minute openings on the friction ridges through which sweat comes out. The diameter of the pores varies from 88 to 220 microns and the number from 9 to 18 per cm. They have characteristic shapes and sizes.

The study of pores has not been utilised to any extent in criminal investigations in India (or elsewhere), mainly because it is difficult to develop pore patterns in chance prints found at the scene of occurrence. Likewise, it is difficult to get a proper specimen print. Print inks of complex formulae have been suggested. Some experts have found ordinary fingerprint ink quite useful for the purpose.

The pore patterns should prove invaluable in incomplete fingerprints and palm or sole prints. Their infinite variations will allow identification of the print. Twenty to forty pores would provide sufficient evidence for identification purposes.

5.12.3 Body Prints

Nose prints and prints from other body parts can be utilised for identification purposes. For example, Iris and retinal patterns are being utilised for identification purposes. The simplicity of the fingerprint system, however, makes it convenient to use them for personal identification purposes.

5.12.4 Fingerprints of Twins

The fingerprints from identical twins are different. The basic presumption is that all fingerprints are unique. The support for the assumption is that even when they are from the ten digits of a person they are different. Further, nobody has ever reported identical patterns, identical twins. The misconception that twins carry identical patterns is baseless.

5.12.5 Transmission

Fingerprint images (and formulae) can be transmitted anywhere in the world by internet (e-mails!). The transmissions of fingerprints have been facilitated by the digitalisation of the prints.

5.12.6 Advances in Collection of Fingerprints

Digital holography, micro-X-ray fluorescence (μXRF), and the Scanning Kelvin Probe (SKP) are relatively recent scientific and technological advancements to obtain latent fingerprints without compromising or destroying the original fingerprint evidence found at a crime scene. We have yet to induct the innovations in our system.

5.12.7 New Evaluation Technology

The FBI announced the replacement of the Integrated Automated Fingerprint Identification System (or IAFIS) technology with the Next Generation Identification (NGI) system. The NGI system uses several new biometric features. It reduces significantly the processing times from 2 hours a case, to about 10 minutes. It has improved the quality and the certainty of the matches also. The technology is indispensable and needs adoption in India.

5.13 CASE LAW

Supreme Court Cases

(21st Century)

5.13.1 Absence of Fingerprint Evidence not Fatal[2]

Author's Summary

It is a case of murder of a female by bludgeoning her. There were numerous eyewitnesses to the beating. However, the IO did not check the weapon for fingerprints as too many persons had handled the weapon. The trial court acquitted the culprit for want of fingerprint evidence.

The SC (and High Court) ruled that in view of the consistent eyewitness accounts, the absence of fingerprint evidence is not fatal to the case.

Highlights italicised

Relevant Extracts (Verbatim)

> 4. After going through the judgment of the trial court, we find that the High Court was justified in setting aside the same because the judgment of acquittal is based upon surmises, conjectures and assumed contradictions. The High Court rightly found that in fact, there was no contradiction in the depositions of the eyewitnesses and omissions or improvements noticed by the trial court did not amount to contradictions for the purposes of discarding the testimony of otherwise trustworthy natural witnesses. The trial court totally ignored the testimony of the eyewitnesses while holding that they had not seen the injury because, according to the F.I.R., the injury allegedly had been inflicted on the nose of the deceased. All the witnesses had deposed in the court that the injury was caused on the body of the deceased from behind near the right shoulder and the force with which it was caused resulted in the cutting of the vital inner parts of her body.

Non-examination of the fingerprint expert has not, in any way, affected the case of the prosecution because it has come on record that before the seizure of the weapon of offence many persons had handled it. Though the report of the Serologist is not available on the record, yet the report of the Chemical Analyser clearly and unequivocally shows that the clothes of the appellant and the weapon of offence were stained with human blood. Non-ascertainability of the blood group cannot be made a basis to discard the evidence of eye-witnesses.

5.13.2 Court No Fingerprint Expert[3]

Author's Summary

It is a case of fraud and forgery. A thumb mark was disputed on a sale agreement. The finding of the first appellate court, merely on a casual perusal, recorded without the benefit of any expert opinion, that **'there appeared to be no marked differences between the two thumb impressions, and therefore sale agreement must have been executed by first defendant'**, The tial judge as expert was unacceptable to SC.

Relevant Extracts (Verbatim)

2. In the plaint, the plaintiff (appellant) alleged that the first defendant (Adilakshmi) agreed to sell the suit schedule property to him under an agreement of sale dated 5-1-1980 for a consideration of Rs. 3,000, and received Rs. 2,000 as advance. She agreed to execute a sale deed by receiving the balance consideration of Rs. 1,000 within three months. Possession of the suit property was delivered to him, under the said agreement. He issued a notice dated 14-2-1980 calling upon the first defendant to receive the balance price and execute the sale deed. The first defendant sent a reply denying the agreement. To avoid performing the agreement of sale, the first defendant executed a nominal sale deed in regard to the suit property in favour of the second defendant (first respondent herein), who was her close relative. The said sale was neither valid nor binding on him. On the said averments, he sought specific performance of the agreement of sale, against the defendant, alleging that he was ready and willing to perform his part of the contract.

3. The defendants denied the allegation that the first defendant had executed an agreement of sale dated 5-1-1980 in favour of the plaintiff or that she had delivered possession of the suit property to him. They contended that plaintiff had concocted and forged the document with the help of his henchmen to defraud the defendants. They claimed that the first defendant had executed a valid sale deed dated 11-2-1980 in favour of the second defendant and had delivered possession of the suit property to her; and that the second defendant had put up a hut in the schedule property and was actually residing therein. The second defendant raised an additional contention that she was a *bona fide* purchaser for value and, therefore, the sale in her favour was valid.

14. Section 45 of the Indian Evidence Act, 1872 relates to 'opinion of experts'. It provides *inter alia* that when the Court has to form an opinion as to the identity of handwriting or finger impressions, the opinion upon that point of persons specially skilled in questions as to identity of handwriting or finger impressions are relevant facts. Section 73 provides that in order to ascertain whether a finger impression is that of the person by whom it purports to have been made, any finger impression admitted to having been made by that person, maybe compared with the one, which is to be proved. These provisions have been the subject-matter of several decisions of this Court.

14.1. In the *State (Delhi Administration) v Pali Ram*, 1979 Cr LJ 17 : (1979) 2 SCC 158 : AIR 1979 SC 141 Para 29, this Court held that a Court does not exceed its power under section 73 if it compares the disputed writing with the admitted writing of the party so as to reach its own conclusion. But this Court cautioned:

Although there is no legal bar to the Judge using his own eyes to compare the disputed writing with the admitted writing, even without the aid of the evidence of any handwriting expert, the Judge should, as a matter of prudence and caution, hesitate to base his finding with regard to the identity of a handwriting which forms the sheet-anchor of the prosecution case against a person accused of an offence, solely on comparison made by himself. It is therefore, not advisable that a judge should take upon himself the task of comparing the admitted writing with the disputed one to find out whether the two agree with each other; and the prudent course is to obtain the opinion and assistance of an expert.

The caution was reiterated in *O. Bharathan v K. Sudhakaran*, (1996) 2 SCC 704 : 1996 AIR SCW 685 : AIR 1996 SC 1140; Again in *Ajit Savant Majagvai v State of Karnataka,* (1997) 7 SCC 110 : 1997 AIR SCW 3315 : AIR 1997 SC 3255) referring to section 73 of the Evidence Act, this Court held:

The section does not specify by whom the comparison shall be made. However, looking to the other provisions of the Act, it is clear that such comparison may either be made by a handwriting expert under section 45 or by anyone familiar with the handwriting of the person concerned as provided by section 47 or by the Court itself.

As a matter of extreme caution and judicial sobriety, the Court should not normally take upon itself the responsibility of comparing the disputed signature with that of the admitted

signature or handwriting and in the event of the slightest doubt, leave the matter to the wisdom of experts. But this does not mean that the Court has not the power to compare the disputed signature with the admitted signature as this power is clearly available under section 73 of the Act.

14.2. In *Murari Lal v State of Madhya Pradesh*, (1980) 1 SCC 704 : AIR 1980 SC 531 : 1980 Cr LJ 396, this Court indicated the circumstances in which the Court may itself compare disputed and admitted writings, thus:

The argument that the Court should not venture to compare writing itself, as it would thereby assume to itself the role of an expert is entirely without force. Section 73 of the Evidence Act expressly enables the Court to compare disputed writings with admitted or proved writings to ascertain whether a writing is that of the person by whom it purports to have been written. If it is hazardous to do so, as sometimes said, we are afraid it is one of the hazards to which Judge and litigant must expose themselves whenever it becomes necessary. There may be cases where both sides call experts and the voices of science are heard. There may be cases where neither side calls an expert, being ill able to afford him. In all such cases, it becomes the plain duty of the Court to compare the writings and come to its own conclusions. The duty cannot be avoided by recourse to the statement that the Court is no expert. Where there are expert opinions, they will aid the Court. Where there is none, the Court will have to seek guidance from some authoritative textbook and the Court's own experience and knowledge. But discharge is must, its plain duty, with or without expert, with or without other evidence.

The decision in *Murari Lal* (supra) was followed in *Lalit Popli v Canara Bank,* (2003) 3 SCC 583 : 2003 AIR SCW 1238 : AIR 2003 SC 1796.

15. While there is no doubt that Court can compare the disputed handwriting/ signature/finger impression with the admitted handwriting/signature/finger impression, such comparison by Court without the assistance of any expert, has always been considered to be hazardous and risky. When it is said that there is no bar to a Court to compare the disputed finger impression with the admitted finger impression, it goes without saying that it can record an opinion or finding on such comparison, only after an analysis of the characteristics of the admitted finger impression and after verifying whether the same characteristics are found in the disputed finger impression. The comparison of the two thumb impressions cannot be casual or by a mere glance. Further, a finding in the judgment that there appeared to be no marked differences between the admitted thumb impression and disputed thumb impression, without anything more, cannot be accepted as a valid finding that the disputed signature is of the person who has put the admitted thumb impression. Where the Court finds that the disputed finger impression and admitted thumb impression are clear where the Court is in a position to identify the characteristics of fingerprints, the Court may record a finding on the comparison, even in the absence of an expert's opinion. But where the disputed thumb impression is smudgy, vague or very light, the Court should not hazard a guess by a casual perusal.

The decision in Murari Lal (supra) and Lalit Popli (supra), should not be construed as laying a proposition that the court is bound to compare the disputed and admitted finger impressions and record a finding thereon, irrespective of the condition of the disputed finger impression. When there is a positive denial by the person who is said to have affixed his finger impression and where the finger impression in the disputed document is vague or smudgy or not clear, making it difficult for comparison, the Court should hesitate to venture a decision based on its own comparison of the disputed and admitted finger impressions. Further, even in cases where the Court is constrained to take up such comparison, it should make a thorough study, if necessary with the assistance of counsel, to ascertain the characteristics, similarities and dissimilarities. Necessarily, the judgment should contain the reasons for any conclusion based on comparison of the thumb impression, if it chooses to record a finding thereon. The

Court should avoid reaching conclusions based on a mere casual or routine glance, or perusal.

16. In this case the first defendant had denied having put her finger impression on Ex. A-1. She died during the pendency of the suit before her turn came for giving evidence. The High Court having examined the document has clearly recorded the finding that the thumb mark in Ex. A-1 was pale (that is light) and not clear. The document though dated 1980, was executed on two stamp papers which were purchased in 1973 and 1978. Contrary to the recital in the agreement that possession had been delivered to the plaintiff, the possession was not in fact delivered to plaintiff, but continued with the first defendant and she delivered the possession to the second defendant. The title deeds were not delivered to the plaintiff. The attesting witnesses were close relatives of plaintiff and one of them was not examined. The scribe's evidence was unsatisfactory. It was also difficult to believe that the first defendant, an illiterate old woman from a village, would enter into an agreement of sale on 5-1-1980 with plaintiff, and even when he is ready to complete the sale, sell the property to someone else hardly a month thereafter, on 11-2-1980. In this background, the finding by the first appellate Court, recorded without the benefit of any expert opinion, merely on a casual perusal, that there appeared to be no marked differences between the two thumb impressions, and therefore Ex. A-1 (sale agreement) must have been executed by first defendant, was unsound.

5.13.3 Fingerprint identifies the barbaric Murderer[4]

Author's Summary

It is a case of brutal rape, murder and robbery of a young widow. The courts accepted the identification of the culprit through fingerprints found on the almirah (at the crime scene) from which the valuables were robbed. The fingerprints played the crucial role to place the culprit at the scene and identify him.

The SC maintained the death sentence for the brutal murder, dubbing it as '**the rarest of the rare cases**'.

Highlights italicised

Relevant Extracts (Verbatim)

According to the prosecution, Jayashri, mother of Suresh (PW-2) and sister of Manjula (PW-22), was married to one Dr. Maradi Subbaiah who died about two years prior to 28-2-1998 on which date the incident which resulted in S.C. No. 725 of 1999 is alleged to have occurred. After the death of her husband, Jayashri and her son Suresh, were staying in premises No. 14/8 situated at Dasarahalli, Bhuvaneshwarinagar, Bangalore, as a tenant of one Lalitha Jaya (PW-8). Suresh was studying in Upper K.G. in Blossom English School. His mother would drop him to school at Bagalkunte at 8.30 a.m. and would bring him back at 1.00 p.m. after classes were over.

* * *

On 28-2-1998, Jayashri took Suresh to school as usual at 8.30 a.m. and brought him back at 1.00 p.m. and they had lunch together in the house. After lunch, Suresh went out to play with his friends and apart from Jayashri there was no one else in the house. Suresh returned to the house at about 5.00 p.m. and saw the accused, B.A. Umesh, in the hall of the house who introduced himself as "Uncle Venkatesh" and told Suresh that his mother, Jayashri, was

4. *BA Umesh v Registrar-General, High Court of Karnataka*, Criminal Appeal Nos. 285–286 of 2011, decided on 1 February 2011.

possessed by the devil and that he had, therefore, tied her hands and was going to bring a Doctor. The accused then left the house with a bag filled with articles.

According to the prosecution, Basvaraju (PW-10) and Natesh (PW-11) saw the accused going out of Jayashri's house with the bag on 28-2-1998 at about 4.30 p.m Suresh then went into the room and saw his mother lying flat on the ground with blood on the floor and her hands tied together with a sari at one end and the other end of the sari was tied to a window. As she did not respond to his voice, Suresh went to Kusuma Shetty (C.W. 7), a neighbour, and told her what he had seen. Kusuma Shetty called Geetha Hegde (C.W. 6) and Lalitha Jaya (PW-8) and together they went near Jayashri's house with Suresh and through the window they saw Jayashri lying on the ground. Lalitha Jaya then called Bylappa (PW-7), a Police Constable, living in the same locality who telephoned Papanna (PW-9), the Inspecting Officer, who came to the place of occurrence with Police Constable Garudappa (PW-6). In the meantime, on being informed, A. Kumar (PW-14) a Police Constable working in the Dogs Squad, Jagannath (PW-16), a Police Photographer and R. Narayanappa (PW-13) a Police Inspector and fingerprint expert arrived at the place of occurrence. B.N. Nyamaagowda (PW-29), the Investigating Officer, found that Jayashri was lying dead on the floor with her genitals exposed and blood oozing from her vagina. The doors of an almirah in the house were open and articles in the house were lying scattered. He prepared a report and sent the same through PW-6 to the Police Station to register a crime. PW-6 took the said report to Peenya Police Station and the same was registered as Crime No. 108 of 1998. He then prepared a First Information Report and sent the same to Court. A copy of the F.I.R. was also sent to PW-29, the Investigating Officer. PW-14 had come from the Dogs Squad with Dhrona, a sniffer dog, who having sniffed the dead body and Jayashri's clothes went towards the pipeline and returned. PW-16, the Police Photographer, took photographs of the dead body and the scene of the offence, PW-13, the finger-print expert, found fingerprints on a wall clock and also on the handle of the almirah (Exts. P. 14 and P. 15). PW-29, thereafter, conducted inquest over the dead body in the presence of Panch witnesses, P.Ws. 2, 3 and 4, and sent the dead body for post-mortem examination to Dr. Somashekar (PW-26) who after conducting the post-mortem on Jayashri's dead body opined that death had occurred due to smothering after the commission of sexual assault.

* * *

Ms. Suri submitted that the other prosecution witnesses were those who had been associated with the investigation in one way or the other, such as PW-13, Narayanappa, the fingerprint expert who found the fingerprint of the appellant on the handle of the almirah in the victim's room, PW-26, the doctor who conducted the post-mortem examination on the body of the victim, PW-27, D. Siddaramaiah, Forensic Expert and PW-29, the Investigating Officer in the case.

* * *

Ms. Suri then addressed the third aspect of the prosecution case relating to the lifting of the fingerprint of the appellant from the handle of the almirah in the room of the deceased. It was contended that the procedure adopted for obtaining the fingerprint of the appellant by PW-25, while he was in custody, for the purpose of comparison with the fingerprint, lifted from the handle of the almirah in the room of the deceased, left sufficient room for doubt about the authenticity of the fingerprint taken from the appellant for the purpose of comparison. It was submitted that rather curiously all the other fingerprints in the room, including the one taken from the wall clock, were smudged and were of no use for the purpose of comparison, which also gave rise to doubts as to whether the fingerprints alleged to have been taken from the handle of the almirah in the room of the deceased, had actually been lifted from the said place. Ms. Suri submitted that the fingerprint of the appellant taken by PW-25 when the appellant was in custody, should have been taken before a Magistrate to ensure its authenticity. Furthermore, although, the said fingerprint was taken on 8-3-1998, the same was sent to the F.S.L only on 15-3-1998.

Furthermore, the specimen fingerprints of the accused had not been taken before or under the order of the Magistrate and, accordingly, the conviction based on the evidence of the fingerprints of the accused on the brass jug were held to be not sustainable. Ms. Suri also referred to the decision in *Musheer Khan's* case (supra), where the question of the evidentiary value of a fingerprint expert was considered apart from the question of identification and it was held that such evidence fell within the ambit of section 45 of the Evidence Act, 1872. In other words, the evidence of a fingerprint expert is not substantive evidence and can only be used to corroborate some items of substantive evidence which are otherwise on record and could not, therefore, have been one of the main grounds for convicting the appellant of the offences with which he had been charged.

* * *

31. The fourth question which had been indicated by Ms. Shenoy regarding the identification of the fingerprints taken from the handle of the steel almirah kept in the room of the deceased, here the charged offences had been committed, clearly establishes the presence of the appellant in the said room. Ms. Shenoy submitted that there was no acceptable explanation from the side of the defence to explain the fingerprints of the appellant on the handle of the almirah, which was in the room of the deceased. Ms. Shenoy urged that once the presence of the appellant was established in the room when and where the offences were perpetrated, the chain of circumstantial evidence was to a large extent almost complete and was completed with the recovery of the articles stolen from the room of the deceased, in the room rented to the appellant by Jayamma (PW-17).

* * *

49. The aforesaid position is further strengthened by the Forensic Report and that of the Fingerprint Expert to establish that the fingerprints which had been lifted by PW-13 from the handle of the steel almirah in the room, matched the fingerprint of the appellant which clearly established his presence inside the house of the deceased. The explanation attempted to be given for the presence of the fingerprints on the handle of the almirah situated inside the room of the deceased does not inspire any confidence whatsoever. In a way, it is the said evidence which scientifically establishes beyond doubt that the appellant was present in the room in which the deceased was found after her death and had been identified as such not only by PW-2, who actually saw him in the house immediately after Jayashri was murdered, but also by P.Ws 10 and 11, who saw him coming out of the house at the relevant point of time with the bag in his hand. The fingerprint of the appellant found on the handle of the almirah in the room of the deceased proves his presence in the house of the deceased and that he and no other caused Jayashri's death after having violent sexual intercourse with her against her Will.

50. Apart from causing the death of the victim, the evidence also points to the commission of rape of the deceased by the appellant. That the deceased was lying naked with blood oozing out of her genitals and both her hands tied by a sari at one end clearly indicate violent sexual intercourse with the deceased. The presence of semen-like material in her vagina, which was found during the post-mortem examination, was collected and sent for micro biological examination and showed the presence of sperms. The presence of spermatozoa in the vaginal smear which was sent for micro-biological examination and the presence of blood stains at the vaginal outlet together with laceration of the vagina from the vaginal outlet on the posterior wall establishes and confirms the charge of violent sexual intercourse, *viz.*, rape.

On the question of the sentence we are satisfied that the extreme depravity with which the offences were committed and the merciless manner in which death was inflicted on the victim, brings it within the category of rarest of rare cases which merits the death penalty, as awarded by the Trial Court and confirmed by the High Court.

5.13.4 Non-exhibited Report Inadmissible[5]

Author's Summary

It is a case of forged Document, not bearing thumbprints of alleged signatories. A fingerprint expert report to that effect was on case file. It was not exhibited; nor copy given to accused.

It is a case of comedy of errors. The prosecutor failed to exhibit it/or give its copy to the accused. The trial court did not exhibit it officially. The appellate court failed to correct the lacuna.

The case went to SC. It did not accepted un-exhibited report and acquitted the accused as it was the only important evidence.

Highlights Italics

Relevant Extracts (Verbatim)

8. The learned counsel for the petitioners vehemently submitted that both the Courts below have committed serious error of law in convicting petitioners for the offences under sections 468/120-B and 419/120B, IPC. According to the learned counsel for the petitioner, the prosecution failed to prove that the thumb impression of any of the persons on the sale-deed dated 14-7-1982 (Ex. P. 1) is forged one. According to the learned counsel for the petitioners, out of 10 witnesses, three witnesses PW-5 Hanuman Singh, PW-6 Magan Singh and PW-7 Ganesh turned hostile. From the statements of the rest of the witnesses, even remotely, it cannot be gathered that they have proved thumb impressions of any of the executants as forged one.

The best evidence, which was available to the prosecution was Fingerprint Expert and his report but neither Fingerprint Expert was produced nor even the fingerprint report was tendered in evidence. Even no question was put to the accused about the said report, therefore, the entire finding passed on the alleged fingerprint report is a finding based on no evidence.

Both the Courts below misconstrued the section 293(iv)(g), Cr.P.C. [wrongly mentioned as clause (g) in the judgment of the trial court, the relevant is clause (c)]…A document which is admissible in evidence but has not been tendered in evidence and which has not been proved in accordance with the law, is not evidence in the eye of law. The Courts below failed to draw, distinction between admissibility of a document and its proof. It is also submitted that mere production of document or tendering it in evidence is not sufficient. It is required to be proved in accordance with law. The opinion of Expert is only an opinion and the Expert is required to prove his opinion and unless an opportunity of cross-examination is provided, the evidence of Fingerprint Expert also is of no value. According to the learned counsel for the petitioners, it is a case of no evidence, therefore, this Court can well within its revisional jurisdiction to interfere with the order of the Courts below and the order of conviction is absolutely without jurisdiction as the same is based on no evidence. The learned counsel for the petitioners further submitted that there is no eyewitness who has seen putting thumb impressions of Ramu or Mangala on the document executed. Contrary to it, the evidence of PW-1 Balwant Singh, Tehsildar-cum-Sub-Registrar, PW-4 Mohan Lal, Deed Writer fully proved that the deed was executed by all the executants of the sale-deed dated 14-7-1982.

9. The learned P.P. supported the judgments of the two Courts-below and submitted that both the two Courts-below after appreciation of the evidence finding of fact against the petitioner-accused persons and held them guilty for the offences under sections 468/120B and 419/120-B, IPC. The learned P.P. admitted that the fingerprint report was not tendered in evidence and Fingerprint Expert himself was not produced by the prosecution but at the same time, the learned P.P. submits that the report is admissible in

5. *Chauthu Ram v State of Rajasthan*, 2005 Cr LJ 1051 (SC) : RLW 2005 (2) Raj 775.

evidence and the court can look into the report itself to find out the truth. The trial court as well as the appellate Court, therefore, rightly considered the report of the Fingerprint Expert and they rightly arrived at the conclusion that thumb impression of Mangala and Ramu have been fabricated and forged on Ex. P. 1 sale-deed dated 14-7-1982.

10. I considered the submissions of the learned counsel for the parties and perused the record.

11. The main thrust of the argument of the learned counsel for the petitioner is that the only evidence about putting the forged thumb impression of Mangala and Ramu, relied upon by the two courts-below, is fingerprint report. It is true that the said report was never tendered in evidence nor any exhibit mark has been put on this report. Section 293, Cr. P.C. says that any document purporting to be a report under the hand of Government Scientific Expert to whom section 293 applies, given after examination or analysis by him in the course of any proceeding under the Code of Criminal Procedure may be used as evidence, not only in an enquiry but also in trial and other proceeding under the Code of Criminal Procedure. However, sub-section (2) of section 293, Cr.P.C. Provides that the Court may if thinks fit, summon and examine any such Expert. Therefore, the report which is already available on record and issued by the Director, Finger Print Bureau, Rajasthan, Jaipur, could have been looked into by the courts below. However, this may make the report a piece of evidence and not more than that even under section 293(1), Cr.P.C.

12. Section 313, Cr.P.C. provides that the accused is required to be given an opportunity to explain any circumstance appearing in the evidence against him. If the prosecution intends to use the said report as a piece of evidence, as circumstance appearing against the accused persons, then it should have been put to the knowledge of the accused by the Court by pointing out the accused about the said report so that the accused persons could have explained the circumstances. Since there is no eyewitness to prove the fact that someone else has put thumb impressions of Mangala and Ramu over the disputed sale-deeds, therefore, the fingerprint report was the important piece of evidence and such evidence had not been brought to the notice of the accused persons during trial then said piece of evidence cannot be used against the accused persons. The first appellants Court strangely held that since the fingerprint report was not exhibited in evidence, therefore, there was no cause for putting any question to the accused about the fingerprint report. The reasons given by the first appellate Court appears to be contrary to law. If the argument is accepted that even without tendering in evidence and without exhibiting the fingerprint report, that report can be used as evidence against the accused-petitioners then this is evidence only and not conclusive proof of fact stated in the report. If the prosecution intends to rely upon this report as circumstance against the accused persons then section 313, Cr.P.C. definitely requires that circumstance should have been brought to the notice of the accused.

The report of the Fingerprint Expert is an important document and the entire allegation of having the forged thumb impressions of Mangala and Ramu over the sale-deeds is based upon this report only. In these circumstances, even if it is held that the Fingerprint Expert's report is a piece of evidence, as per sub-section (1) of section 293, Cr. P.C. even then this cannot be used against the accused persons as it was never brought to the notice of the accused persons nor the accused persons were given opportunity to explain the circumstance under section 313, Cr.P.C. Merely on this ground alone, the accused persons deserve acquittal.

5.13.5 Taking of fingerprints without obtaining the order of Magistrate[6]

Author's Summary

Under Section 4 of the Identification of Prisoners Act, 1920 Police Officer is entitled to take fingerprints though the order not taken from the Magistrate. But it is desirable to take the fingerprints before or under the order of the Magistrate to dispel any suspicion. In this case even if, fingerprints of appellant's, chance print Mark (taken from iron safe) was identical to the specimen of left palm impression of Sonvir, it does not complete the chain of circumstances unerringly pointing out fingers to the appellant, that it was the appellant who committed the murder. Thus the appellant stands acquitted of the charges u/ss 302, 392 read with Section 34 of the IPC.

Highlights Italics

Relevant Extracts (Verbatim)

6.5 Forensic Report regarding matching finger impressions provides that the prosecution relied upon the report tendered by the Senior Finger Print Expert of the Fingerprint Bureau, RN Rawat (PW-35), to state that the finger 50 impressions obtained from the appellant matched with the chance prints obtained from the scene of the crime.

The Trial Court and the High Court considered the six chance prints lifted from the first floor of the house by SI Naresh Kumar Sharma (PW-8), incharge of the Finger Prints Bureau, Crime Branch. Chance prints Q1 to Q3 were lifted from the iron box on the first floor, Q4 from the showcase glass, and Q5 and Q6 from the iron safe. The Senior Finger Prints Expert of the Fingerprint Bureau, RN Rawat (PW-35), vide his reports (Ex. PW-35/A and Ex. PW-35/B), opined that the chance print marked Q1 was identical to the specimen right palm impression of Sultan @ Rajesh (Accused No. 1), while chance print marked Q5 was identical to the specimen left palm impression of Sonvir @ Somvir (Appellant-Accused No. 2). The specimen chance prints of both these accused viz. Rajesh @ Sultan (Accused No. 1) and Sonvir @ Somvir (Appellant-Accused No. 2) were taken by the I.O. - SI Amrit Raj (PW-32A), without obtaining an order of a Magistrate whilst the accused were in police custody. This leads to the issue as to whether the report of the Forensic Expert is admissible in evidence, in light of the provisions of the Identification of Prisoners Act, 1920 since no rules have been framed prescribed by the Government of NCT of Delhi.

8. The scheme of the Act indicates that Section 3, Section 4 and Section 5 are separate and independent provisions pertaining to taking of measurements. Measurement has been defined under Section 2(a) to include finger impression and footprint impression. In the present case, it is the Police Officer, who have taken fingerprints of the appellant after he was arrested which is referable to Section 4 of the Act.

31. Under Section 4 Police officer is competent to take fingerprints of the accused but to dispel as to its bona fide or to eliminate the fabrication of evidence it was eminently desirable that they were taken before or under the order of magistrate.

32. Under Section 4 Police Officers are not entitled to take fingerprints until the order is taken from the Magistrate. The observations were made that it is desirable to take the fingerprints before or under the order of the Magistrate to dispel any suspicion.

6. *Sonvir v State of NCT of Delhi*, (2018) 8 SCC 24 : Criminal Appeal No. 958 of 2017, decided on 2 July 2018(SC).

38. The appellant supporting the judgment of the Delhi High Court contends that since Section 4 uses the words "allow his measurement to be taken in the prescribed manner", unless there is a prescribed manner by the rules, fingerprints cannot be taken. The power of the State given under Section 8 to frame rules is an enabling power. The word used under Section 8 is, the State Government "may". Can it mean that till the rules are framed by the State, power under Sections 3 and 4 cannot be exercised? The power given to the Police Officer to ask a person arrested to give his measurements is a substantive power. This power is hedged by the condition that such measurement has "to be taken in the prescribed manner" if there is any prescribed manner that cannot be breached by such Police Officer. Taking of the measurements in the prescribed manner is a procedural part of the Section which does not affect the substantive power of the Police Officer to ask an accused who is under arrest to give his measurement.

39. In the event, it is held that unless the rules are framed under Section 8, power under Section 4 cannot be exercised that will not be in consonance with the very purpose and object for which Section 4 has been enacted. The submission of the appellant further is that when there is no rule framed providing prescribed manner for taking fingerprints, resort to Section 5 has to be taken by IO. Section 5 is a separate power given to Magistrate. The power of the Magistrate is an additional and separate power to secure ends of justice for purpose of investigation and proceedings under Code of Criminal Procedure. It may be exercised even in a case where after arrest Police Officer has not taken fingerprints of an accused. But, it cannot be held that power under Section 4 can be exercised by the Police Officer only after obtaining an order under Section 5.

52. Even if, we accept that fingerprints of appellant's, chance print Mark Q5 (taken from iron safe) were identical to the specimen of left palm impression of Sonvir, it does not complete the chain of circumstances unerringly pointing out fingers to the appellant, that it was the appellant who committed the murder. Law of conviction based on circumstantial evidence is well settled.

54. In result, the appeal is allowed. The appellant stands acquitted of the charges under Sections 302, 392 read with Section 34 of the IPC.

In *Ashish Jain v Makrand Singh,*[7] the Supreme Court has observed that:

pursuant to S. 8 of the Identification of Prisoners Act, rules have been framed by the Madhya Pradesh government for the purpose of carrying into effect the provisions of the said Act.. The relevant rules for the matter on hand are Rules 3, 4 and 5.

A bare reading of these rules makes it amply clear that a police officer is permitted to take the photographs and measurements of the accused. Fingerprints can be taken under the directions of the police officer. As held by this Court in *Sonvir* (supra), although Section 4 mentions that the police officer is competent to take measurements of the accused, but to dispel doubts as to its bona fides and to rule out the fabrication of evidence, it is eminently desirable that they were taken before or under the order of a Magistrate. However, the aforesaid observations cannot be held to mean that this Court observed that under Section 4, police officers are not entitled to take fingerprints until the order is taken from a Magistrate. If certain suspicious circumstances do arise from a particular case relating to the lifting of fingerprints, in order to dispel or ward off such suspicious circumstances, it would be in the interest of justice to get orders from the Magistrate. Thus there cannot be any hard and fast rule that in every case, there should be a magisterial order for lifting the fingerprints of the accused. Thus, it cannot be held that the fingerprint evidence was illegally obtained merely due to the absence of a magisterial order authorizing the same. At the same time, we find that in the current facts and circumstances, the absence of a magisterial order casts doubts on the credibility of the fingerprint evidence, especially with respect to the packing and sealing of the tumblers on which the fingerprints were allegedly found, given that the attesting witnesses were not independent witnesses, being the family members of the deceased.

7. *Ashish Jain v Makrand Singh,* Criminal Appeal No. 1980 of 2008, decided on 14 January 2019 (SC).

Thus, we cannot rule out the possibility of tampering and post facto addition of fingerprints, and concur with the High Court in discarding the fingerprint evidence.

28. It is noteworthy to mention that the DIG of Police had visited the scene of the crime shortly after finding the bodies, which is evident from the deposition of witnesses such as PW1. The DIG, upon seeing three tea tumblers and some electrical equipment at the scene of the crime, inferred that the crime may have been committed by three persons who were electricians. This inference drawn by a high-ranking officer in the police is likely to have impeded the course of investigation and created prejudice against the accused persons. The whole investigation and the prosecution case seem to be concocted around this inference made by the DIG, and such a circumstance does not help the case of the prosecution.

29. In light of the aforementioned discussion and reappraisal of evidence by this Court, there is not any glaring infirmity in the acquittal granted by the High Court.

5.14 ADDITIONAL CASE LAW

5.14.1 Expert Necessary[8]

Relevant Extracts (Verbatim)

4. Fingerprints by implication are to be compared with a disputed fingerprint with the help of the expert. I am not prepared to put the limited interpretation on the words "for the purpose of enabling the court to compare" that the court can itself compare the finger impressions and cannot send them to the handwriting expert directly and invite the opinion of the handwriting expert. No doubt, it would be deemed that the court has itself considered the expert's evidence on this point necessary and the expert may be examined as a court witness. The request in the application was that the finger impression of the accused may be taken and sent to the government handwriting expert by the court. They will of course be sent by the court to the Government expert under its own seal and will not be handed over to the prosecution for making such use as the prosecution may consider necessary. It is true that the complainant himself had no *locus standi* under section 493, Cr. PC. (old), but the counsel for the complainant could move the application under the direction of the public prosecutor and there is nothing to show that the application was moved against the wishes of the public prosecutor. Counsel for the complainant is often allowed by the public prosecutor even to advance the argument. In fact, by the aforesaid application the attention of the court was drawn to this aspect and it was ultimately for the court to be satisfied whether it was a fit case in which it would like to take the fingerprints of the accused for comparison. The order ultimately passed by the learned Sessions Judge was obviously passed on his own satisfaction. There is, thus, no illegality in the order passed by the learned Sessions Judge. It is a perfectly just order.

5.14.2 Fingerprint Evidence[9]

Relevant Extracts (Verbatim)

1. The next and the most important circumstance which establishes the complicity of all the three appellants beyond all reasonable doubt is the tracing of their finger impressions on certain silverwares that were found scattered in the store-room of *"Ranga vilas"* on the morning of 6th June, 1956. P.W. 114 Sri Sivacharan Singh has given evidence to the effect that immediately after recording the statement of P.W. 25 Nagaraj, and submitting the F.I.R. he summoned to the place the photographer and the fingerprint expert attached to the scientific laboratory of police department and requested them to examine the scene and the articles for foot and finger impression, if any. P.W. 108 Thimmiah, the photographer and P.W. 109 Prema, fingerprint expert attached to the laboratory, came to the place at once and examined the several places and the articles for finger and foot impressions. P.W.

8. *Iqbal Ahmad v Ketki Devi*, 1975 All WC 477 : 1975 All Cri C 346 : 1976 Cr LJ 244 (All).
9. *Re* S *Govinda Reddy,* AIR 1958 Mys 150 : ILR 1957 Mys 177 : 1958 Cr LJ 1489 (Mys).

109, Prema examined the premises minutely with the aid of magnifying glass and found some impressions smudged, partial and overlapping in several places and instructed P.W. 108, Thimmiah to take the photographs of them for the purposes of examining them. He also found some impressions on 19 of the silver articles that were lying scattered in the storeroom and showed them to panchayatdars.

He took those nineteen articles to the laboratory for detailed examination with the permission of P.W. 14, Sivacharan Singh, the inspector of police. He developed the latent fingerprints that were on those silverwares with the powdering and processing method and examined them in bright light in the laboratory and found that three of them *viz*. M.O.s 86, 87 and 89 contained finger impressions which were identifiable. He, therefore, requested P.W. 108, Thimmiah to take the photographs of the impressions that he had developed on the three silverwares and enlarge them and furnish him with the positive photographs of these impressions for the purpose of comparison.

P.W. 110 Mohammad Yakoob is the officer-in-charge of the Scientific Laboratory of the Finger Print Bureau. He is an Assistant Superintendent of Police. He had gone to Mereara on official duty on 4th June, 1956, and came back to Bangalore on the evening of 6th June, 1956. P.W. 109 Perma, fingerprint expert, who is working under P.W. 110, Mohammad Yakoob, as an assistant delivered the photographs of the impressions found on M.Os. 86, 87 and 89 to him on 7th June, 1956 for the purpose of examination in the laboratory.

He also delivered all the nineteen articles – M.Os. 81 to 99, to P.W. 110 Mohammad Yakoob, who compared the photographs with the impressions that were found on M.Os. 86, 87 and 89 and found them tallying. He compared the prints on M.Os. 86, 87 and 89 with the three photographs Exhibits P-175, P-176 and P-177 and found them to be the correct photographs of the impressions found on the articles. He also examined the impressions on M.Os. 86, 87 and 89. On 8th June, 1956, P.W. 110 Mohammad Yakoob received the fingertips of the deceased persons Singamma, Vengadamma, Ramalingam, Lava, Kusha and Belur Srinivasa Iyengar.

He took the impressions of the tips of fingers of all those persons and compared them with the enlarged photographs of the impressions found on M.Os. 86, 87 and 89, and found that they did not tally. He informed this fact to the investigating officer on 9th June, 1956 and requested him to furnish the fingerprint impressions of suspects if any, for the purpose of comparison with the developed latest impressions. The evidence adduced in the case makes it abundantly clear that the photographs Exhibits P-175, P-176 and P-177 are the enlarged photographs of the finger impressions found on M.Os. 86, 87 and 89 respectively.

On 11th June, 1956, P.W. 115 Sri Revanna, the investigation officer, directed P.W. 112, Krishnamurthi and P.W. 111, Daffadar Nanjundiah to obtain the thumb impressions of the three accused persons that had been arrested and kept in separate lock-ups in Bangalore City. Accordingly P.Ws. 111 and 112 went to the respective lock-ups and took the finger impressions of all the ten fingers of the three accused persons on Form No. 94 and prepared also the search slips. Exhibit P-191 is one of the fingerprint slips of Govinda Reddy. Exhibit P-190 is one of the fingerprint slips of Krishna and Exhibit P-192 is one of the slips of Muniswamy taken by P.W. 112, Krishnamurthy and P.W. 111, Nanjundiah on 11th June, 1956.

The slips of fingerprints taken from the fingers of the three accused persons were sent to P.W. 115 Revanna and he in turn sent them to P.W. 110 Mohammad Yakoob for the purpose of comparison with the photographs of the latent impressions found on M.Os. 86, 87 and 89. The fingerprint expert compared the impressions found in the fingerprint slips with the enlarged photographs of the latent impressions and found that the two impressions found on M.O. 86 which were marked as "Q" and "Q_1" by him in the photograph Exhibit P-175, tallied with the right ring finger impressions and the right middle finger impression of appellant Krishna, that the impression on M.O. 89 the enlarged photograph of which was Exhibit P-176 tallied with the right middle finger impression of appellant Govinda

Reddy, and the impression on M.O. 87 of which Exhibit P-177 is the enlarged photograph tallied with the right thumb impression of appellant Muniswamy.

P.W. 110 Mohammad Yakoob then directed P.W. 108, Thimmiah, to take the photographs of the impressions of the agreeing fingers from the finger slips. Accordingly P.W. 108 Thimmiah took the photographs in the presence of P.W. 110 Mohammad Yakoob. Exhibit P-193 is the negative of the impression of the right middle finger and of right ring finger Exhibits P-190(b) and P-190(c) respectively and Exhibit P-194 is the enlarged photograph of the right middle finger impression and Exhibit P-195 is the enlarged photograph print of the right ring finger impression of appellant Krishna.

Exhibit P-196 is the negative of the impression of the right middle finger of Govinda Reddy and Exhibit P-197 is the enlarged photograph taken from Exhibit P-191(b). Exhibit P-198 is the negative of the photograph of the right thumb impression of appellant Muniswamy. Exhibit P-199 is the enlarged photograph thereof. P.W. 110 Mohammad Yakoob compared these impressions minutely and carefully in the laboratory and came to the conclusion that the impressions that were found on M.O. 86 were those of the right ring and right middle finger of appellant Krishna that the single impression on M.O. 87 is the Impression of the right thumb of appellant Muniswamy and the impression found on M.O. 89 is the impression of the right middle finger of appellant Govinda Reddy.

The fingerprint expert found as many as fifteen characteristics common between the impression "Q" in Exhibit P-175 and Exhibit P-194, as many as fourteen common characteristics between the impression "Q_1" in Exhibit P-175 and Exhibit P-195 and has described them fully in his written opinion sent to the investigating officer. There were as many as fifteen characteristics that were common between the impression of the right middle finger of appellant Govinda Reddy and the impression that was found on M.O. 89 the enlarged photograph of which is Exhibit P-176.

Similarly the expert found thirteen characteristics which are common to both latent and patent impressions of the right thumb of appellant Muniswamy. The expert who was examined as P.W. 110 in the trial court has been subjected to searching cross-examination and nothing has been elicited to discredit his evidence. The learned sessions judge has accepted the opinion of the expert about the identity of these impressions. The conclusion based on the same by the learned trial judge has been challenged by learned counsel for the appellants on many grounds.

It was contended that P.W. 108, Thimmiah is an amateur in photography, that he had not taken the photographs of all the nineteen articles, photographs of M.Os. 86, 87 and 89 with the impressions on them and that he had not taken the contact photographs of these negatives to show that Exhibit P-195, Exhibit P-196 and Exhibit P-197 are the enlarged photographs of them and, therefore, no value should be attached to them. There is absolutely no substance in any of these contentions. P.W. 108, Thimmiah has stated in his evidence that he is working as a photographer in the police department for the last 25 years.

It is no doubt true that he does not possess any technical qualification inasmuch as he has neither obtained a degree nor a diploma in photography but his experience for over 25 years in photography is sufficient enough to call him as an expert. P.W. 108, Thimmiah has stated in his evidence that he did all what he was directed to do by P.W. 109, Prema and P.W. 110, Mohammed Yakoob and nothing more. The mere fact that he had not taken the photographs of these nineteen articles and the photographs of the three articles M.Os. 86, 87 and 89 with the impressions on them cannot be a ground to discard his evidence. He has stated that he did not feel it necessary to take the photographs of the article with the impressions on them since the articles themselves were likely to be produced before the court for the purposes of comparison.

He has also stated that he took enlarged photographs directly from the negatives and, therefore, there was no need to take the contact prints from them. There is absolutely nothing to doubt the correctness of the statement made by P.W. 108, Thimmiah, about the identity of the articles from which he took the photographs and enlarged them. It was

contended that P.W. 110, Mohammed Yakoob, is not an expert inasmuch as he had not sufficient experience in the matter of comparison of thumb-impressions and the learned trial judge was not justified in entirely depending his opinion upon in coming to the conclusion that the impressions found on M.Os. 86, 87 and 89 tallied with some of the finger impressions of appellants Krishna, Muniswamy and Govinda Reddy respectively.

It is seen from the judgment of the learned Sessions Judge that he did not delegate his duties to the expert of fingerprints. He has not based his conclusions simply because the expert stated that the fingerprints are identical but on the contrary he has on an elaborate, thorough and detailed discussion on the evidence of the expert, agreed with the opinion of the expert. Moreover, the learned trial judge has stated in the course of his judgment that he examined the enlarged photographs of the patent impressions with the disputed latent fingerprints with the aid of magnifying glass and found them tallying.

There is absolutely nothing to doubt the statements of the learned Sessions Judge. The science of comparison of fingerprints has developed to a stage of exactitude. It is quite possible to compare the impressions taken from fingerprints of individuals with the disputed impressions, provided they are sufficiently clear and enlarged photographs are available. The identification of finger impressions with the aid of good magnifying glass is not difficult, particularly when the photographs of latent and patent impressions are pasted side by side. We have ourselves examined the enlarged photographs of the admitted and the disputed thumb-impressions which are pasted on sheets of paper and we have no doubt in our mind that the opinion of the expert is correct.

The opinion of the expert, based as it is on a careful comparison of the enlarged photographs, has not been shattered by the lengthy cross-examination. There is absolutely no reason to think that there is any room for error in matters of this kind. It appears to us that P.W. 110, Mohammed Yakoob, has compared the disputed and the patent impressions carefully and the learned Sessions Judge was perfectly justified in accepting his opinion and basing his conclusion that the impressions found on M.Os. 86, 87 and 89 tally with the right ring and right middle finger impressions of appellant Krishna, the right thumb-impression of appellant Muniswamy and the right middle finger impression of appellant Govinda Reddy, respectively.

5.14.3 Blood-stained Fingerprint[10]

Relevant Extracts (Verbatim)

Presence of blood-stained fingerprint on the wooden Kilini (MO II) is also very relevant. P.W. 11 has stated that he detected partial chance bloodstained fingerprint on MO II. Since the fingerprint was stained with blood it was preserved and taken to the laboratory and he took the photograph in the laboratory. MOs IV and V are negatives of first and second photographs respectively. According to report of the Director, State Fingerprints Bureau (Ext. 38), finger print of accused tallied with finger print on Kilini marked MO II. As has been observed by apex court in *Jaspal Singh v State of Punjab*, AIR 1979 SC 1708 : (1979) Cr LJ 1386 : 1979 SCC (Cri) 920 science of identifying thumb impression is an exact science and does not admit of any mistake or doubt. It is a great incriminating circumstance. Fingerprint was noticed by P.W. 11 much prior to the arrest of accused as found from the evidence of P.W. 8.

5.14.4 Sufficient Evidence[11]

8. The question was raised before the Sessions Judge as to whether a conviction can be based upon the unsupported testimony of a fingerprint expert. There is no rule of law on the point; it is merely a matter of caution whether a court will act on such unsupported

10. *Madan Mohan Raj v State of Orissa*, 1996 Cr LJ 2578 : 1996 (81) Cut LT 314 : 1996 (10) OCR 48.
11. *State of Bihar v Karu Gope*, AIR 1954 Pat. 131 : 1953 BLJR 488 : 1954 Cr LJ 201 (Pat).

evidence or not. The correct principle was defined by S.K. Ghose J. in - 'Harendra Nath Sen *v* Emperor AIR 1931 Cal 441 at p. 442 (A):

I do not think that it can be laid down as a rule of law that it is unsafe to base a conviction on the uncorroborated testimony of a fingerprint expert. The true rule seems to me to be one of caution that is to say, the court must not take the expert's opinion for granted, but it must examine his evidence in order to satisfy itself that there can be no mistake and the responsibility is all the greater when there is no other evidence to corroborate the expert.

Before their Lordships the cases of – *'Bazari Hajam v Emperor,* AIR 1922 Pat 73 (B) and – 'Basjit Singh *v* Emperor' AIR 1928 Pat 129 were cited as authorities for the proposition that it is not safe to rely merely on a critical inspection of a fingerprint made by an expert. The case in AIR 1922 Pat 73 (B), relates to a period before the coming into force of the Identification of Prisoners Act, 1920 (Act 33 of 1920), which authorised the taking of the comparison in court, Bucknill, J. who delivered the leading judgment criticised in strong terms the taking of thumbprint for such a purpose. That decision, therefore, is not in point. The case in - AIR 1928 Pat 129 (C), is not inconsistent with the view which I have just expressed. Jwala Prasad, J. who delivered the leading judgment cited with approval the observation of their Lordships of the Madras High Court in – 'Public Prosecutor *v* Virammal, AIR 1923 Mad 178 (D)' to the effect that a court cannot refuse to convict a person on the evidence of a fingerprint expert merely on the ground that it is unsafe to base a conviction upon such evidence.

He concluded his examination of the authorities thus:

As to the probative value of the opinion of an expert on fingerprints, it must have the same value as the opinion of any other expert, such as a medical officer, etc. In each case the evidence is only a guide to the court to direct its attention to judge of its value. The court is at liberty to use its own discretion and to come to a conclusion either in affirmance or differing from the view taken by the expert.

In this view it may be said that, as has been held repeatedly in a number of cases, that it is not safe to convict an accused upon the sole testimony of an expert. The danger of such a conviction has also been indicated in the decision of the Madras High Court referred to above. Each case however, must depend on its own circumstances.

I, therefore, proceed to examine the evidence of the expert.

9. Exhibits 11 and 11(1) are the reports of the fingerprint expert. Each of them is drawn up in a printed report from which runs thus:

Finger-print marked.... tallies/tally with the specimen .... Thumb impression .... marked ... finger-print on.... bearing number ...

Finger-print marked ... blurred for a definite report.

Officer-in-charge, Finger-print Bureau C.I.D. Bihar, Patna. (Patna)."

The opinion in each case has been given by filling up the blanks in the first paragraph of the form and drawing a link across the second paragraph. Through carelessness in printing the paper book the cancellation of the second paragraph was overlooked and it was printed as it stands. The mistake caused a little confusion as this paragraph is obviously inconsistent with the opinion given in the first paragraph.

The confusion caused by the misapprehension was only removed after we have verified the facts from the original reports. In the reports beyond stating the fact of the tallying of the impressions in question the expert has said nothing. I think it would be better if in such reports reasons for the opinion expressed are given. This should be a simple matter as the expert must keep some note on the points where he finds tallying at the time when he makes his examination of the document for the purpose of expressing his opinion. The setting out of the reasons at length will help to clarify his ideas and it will furnish a valuable guide to the parties and to the court in testing the value to be attached to that opinion. It would also be fairer to the person against whom the opinion is to be used that the reasons for the opinion are definitely expressed. As matters now stand, the lawyer for the accused

does not know till the witness is actually in the witness-box what his reasons are and he had to be prepared without further notice to cross-examine the witness.

10. In the witness-box the witness has given 11 reasons for identifying the fingerprint on the '*hasua*' with the fingerprint of Bhorik and nine reasons for identifying the enlarged photograph Ext. 3 with the impression of the right foot of the accused Bhorik. The enlargement Ext. 3 and the enlargement of the fingerprint on the '*hasua*' are both blurred, and although I have tried to follow the reasons given by the expert I have found it difficult to do so. Even accepting, though as I have mentioned, there is no evidence on the point, that the enlargement Ext. 3 is an enlarged photograph of the bloody footprint found at the scene of the murder. I do not think that it would be safe on this evidence to hold that the presence of Bhorik has been established.

11. So far as Karu is concerned, I would take the contrary view. Both the impressions on which his conviction depends were distinct impressions. There is no doubt of their identity and although the marking in red ink might have been a little more accurate than it is, it is possible to follow the reasons given by the expert for expressing the view that the two sets of impressions tally with each other. The expert gives as many as 14 reasons for identifying the left thumb-impression of Karu with the enlargement Ext. 2/1 of one of the impressions on the wall. The other impression was a small one. But never-the-less the expert gave as many as 8 points in respect of which it tallied with the impression of the left palm of Karu. There has been some discussion as to the different standards adopted by different fingerprint bureau in the matter of the identification of fingerprints. The expert tells us that according to the Patna Fingerprint Bureau 7 points of similarity are sufficient to identify two prints, whereas some other bureaux are satisfied with merely four points of similarity and others require as many as 12.

The question as to what would be a safe standard to adopt hardly arises in the present case where the expert has found so many points of similarity in two different impressions. I would merely observe that I do not think the establishment of identity by a comparison of fingerprints can be reduced to a mere numerical counting of similarities. A bald statement such as appears in the evidence of the expert that point No. 1 is a bifurcation downwards and point No. 4 is a bifurcation upwards is by itself unconvincing. There may be a bifurcation upwards at corresponding points in the two impressions under comparison, but the configuration may be so different at these points that there is no doubt about the two impressions being of different persons. The fact is that a perusal of the opinion of the expert must be accompanied by a visual study of the two impressions which are under comparison. Regarded in this manner it becomes obvious that the probabilities of a difference at each point of comparison are so great that the chances of tallying very rapidly become infinitesimally small when the comparison is made at a number of points. Hence, tallying at a comparatively few points may be sufficient to establish identity.

5.14.5 Proper Processing: No Lacunae[12]

We have examined the evidence of the prosecution regarding the taking of specimen fingerprints of the respondent, their comparison and examination with the fingerprint on the currency note by the Director, Finger Print Bureau, Phillaur, and his report Ex. P-BB. As the impression mark A on the currency note was partly smudged and partly on the design and the printed writing, it was photographically enlarged along with the right middle finger impression of the respondent, and the two photographic enlargements were marked A/A and I/I respectively. The Director has given the opinion that the photographically enlarged impression marked A/A was "partly smudged but, otherwise, it is comparable and there exist sufficient (not less than 8) points of similarity, *i.e.*, matching ridge, characteristic details in their identical sequence, without any discordance, between its comparable portion and the corresponding portion of the photographically enlarged right middle finger impression of Ajit Singh marked I/I. The Director has further stated that he had graphically shown the

12. *Mohan Lal v Ajit Singh*, AIR 1978 SC 1183 : (1978) 3 SCC 279 : 1978 Cr LJ 1107.

eight points of similarity "in their same form and position" and had indicated the "nature, direction and sequence of each point" in its relevant circle. He has expressed the categorical opinion that so many points of similarity could not be found to occur in impressions of different thumbs and fingers and that they were therefore "identical" or were "of one and the same person". There were other impressions also on the currency notes, but they were either sufficiently smudged and partly interfered with by the design and the printed matter or were sufficiently faint and were rejected as unfit for comparison.

Nothing substantial has been urged to challenge the opinion of the Director of the Finger Print Bureau, and all that has been argued is that as there were only eight points of similarity, there was not enough basis for the expert's opinion about the identity of the fingerprints. Reference in this connection has been made to B.L. Saxena's "*Identification of Handwriting, Disputed Documents, Fingerprints, Foot Prints and Detection of Forgeries"* 1968 Edition, page 247, Walter R. Scott's *"Fingerprint Mechanics"* page 62, and M.K. Mehta's *"The Identification of Thumb-Impressions and the Cross-Examination of Finger Print Experts"* 2nd Edition, page 28. We have gone through these books but they do not really support the argument of the learned counsel for the respondent. While referring to the old practice of looking for a minimum of twelve identical characteristic details, Saxena has admitted that the modern view is that six points of similarity of the pattern are sufficient to establish the identity of the fingerprints. Walter Scott has stated that "as a matter of practice, most experts who work with fingerprints constantly satisfy themselves as to identity with eight or even six points of identity." Mehta has also stated that in the case of blurred impressions the view of some of the Indian experts is that if there were three identical points, they would be sufficient to prove the identity. There is no gain saying the fact that a majority of fingerprints found at crime scenes or crime articles are partially smudged, and it is for the experienced and skilled fingerprint expert to say whether a mark is usable as fingerprint evidence. Similarly it is for a competent technician to examine and give his opinion whether the identity can be established, and if so whether that can be done on eight or even less identical characteristics in an appropriate case. As has been pointed out, the opinion of the Director of the Finger Print Bureau in this case is clear and categorical and has been supported by adequate reasons. We have therefore no hesitation in accepting it as correct.

5.14.6 Improper Presentation[13]

I have scanned the evidence of the expert. His statement before the magistrate about the identity of the disputed impression with the undisputed fingerprints of the accused, gives no reasons for his view. How he came to that conclusion was never explained. He merely filed a list of common characteristics, about none of which was anything elicited in the examination-in-chief or even in the cross-examination. The court totally failed in its duty of scrutinising the evidence or making a comparison of the impressions personally. The *ipse dixit* of the expert was accepted and acted upon by the court and the accused was convicted. The sessions court too never discussed the question. In this state of things I felt it necessary to summon the expert and elicit some particulars about the reasons on which his conclusion was based.

He brought a magnifying lens and after some difficulty was able to indicate 2 or 3 ridge characteristics as being common to the disputed and undisputed impressions. I have asked him as to what method he used for making comparisons. He confessed that he made no enlargement on the screen. In most of the impressions the delta was missing and he himself admitted that the core was indistinct and when one of the two fixed points is missing it can only be expected that one set of the delta is lacking. Equality in the number of ridges between the core and delta is one of the sure criteria for comparison. A similarity in the type here the loop can carry no significance because all the millions of people inhabiting the world have their fingerprints falling within

13. *Re Godavarthy Bhashyakaracharyulu*, AIR 1960 AP 164 : 1960 Cr LJ 315 (AP).

4 broad types – Arches, Loops, Whorls and Composites. Similarly in this respect this method cannot be a certain index.

We have then the other test *viz.,* a comparison of the ridge characteristics bifurcations upward or downward, abrupt endings, islands and other features. The expert has pointed out a similarity in respect of 2 or 3 ridges but even after a close scrutiny I have not felt sure that there was such similarity established. He has taken one ridge in the disputed impression and another ridge in the admitted impression without having regard to the number which that ridge bears from the fixed point, *viz*. the core and tried to make the comparison. That is certainly a fallacious approach. The core being indistinct and the delta being absent, the expert ought to have taken some fixed point common to both. When questioned on the technique of comparison when neither of the two, the core and delta is visible distinctly the expert would say that he takes for his scrutiny the areas which correspond to each other, judged roughly by distance and direction from the core and begins making comparisons.

I am not satisfied that it is the correct way. In such cases it is expedient that magnification is made on the screen. The location of the 'corresponding areas' can be geometrically fixed relatively to the core at least, because despite indistinctness its location is certain and then a comparison of the ridge characteristics in the two corresponding areas made.

It is not the moral conviction which the expert has that matters. He must rule out the possibility of all reasonable doubt about the identity of the impressions.

Again the expert states that a commonness in about 5 or 6 ridge characteristics suffices for establishing identity. He quotes no authority for this. The characteristics were not brought specifically to the notice of the court. The court never verified the correctness of the conclusion of the expert.

5.14.7 Uncorroborated Evidence[14]

1. In this case, the prosecution version is that the document in question was presented for registration by accused 1 and not by Bootha Khan Padmanabhan by whom the document was purported to be executed. Accused 1 presented the real executant and placed his thumb-impression on the document as well as in the register Ex. B kept in the Sub-Registrar's office when he presented the document and admitted it. A thumb-print of accused 1 was allowed to be taken in court and P.W. 2 an expert was called in to compare the two thumbprints and say if they are of the same person and on the court's opinion that the thumbs marks are identical, a conviction has been entered. Having disbelieved the evidence of P.W. 3, the only evidence against the accused is the opinion of P.W. 2, the fingerprint expert. There is no reliable evidence as to who caused the original of Ex. A to be written and who signed it and in the absence of the forged document itself, the question arises whether it will be safe to act on the uncorroborated testimony of the fingerprints, expert and declare the guilt of the accused. In Bazari Hajam *v* King Emperor, AIR 1922 Pat 73 the same question arose and Bucknill, J., observed thus*:*

I think that apart from the fact that I should be rather sorry without any other corroborative circumstances to convict a person of a serious crime solely and entirely upon similarity of thumb marks or fingerprints, the very fact of the taking of a thumb-impression from an accused person for the purpose of possible manufacture of the evidence by which he could be incriminated is in itself sufficient to warrant one in setting aside the conviction upon the understanding and upon the assumption that such was not really a fair trial. I know of no law by which an accused person can be either by words, or by exposing himself to certain physical treatment made to implicate himself in the crime with which he is charged. When he is on trial such an idea is highly repugnant to all thoughts of the proper administration of justice in this or any other British country.

The above view was disapproved of by Schwabe, C.J. in Public Prosecutor *v* Kandasami Thevan, AIR 1922 Pat 73 although the point did not directly arise in the case as there

14. *Fakir Mohamad v Emperor,* AIR 1936 Bom 151 : (1936) 37 Cr LJ 539.

were thumb-impressions of the accused in evidence other than that taken by the judge in court for comparison with the thumb-impression in the document alleged to have been forged. The learned Chief Justice did not see any objection in law to the taking of the accused's thumb mark, if the judge trying the case thought that it was relevant at any time. It is unnecessary to cite more cases to illustrate the divergence of opinion on the question among the High Courts in India. On principle it appears to us that the accused could not have been required to furnish any evidence in support of the case for the prosecution. This principle was indicated in the decision cited by us above a summary of which was published in page 69 of Volume IX of the Travancore Law Times. We therefore agree with the view expressed by Bucknill, J., in *Bazari Hajam v King-Emperor*[1] that the practice of taking the thumb-impression of the accused and using it against him is inconsistent with the principle of a fair trial and has to be severely condemned.

As a result of the foregoing discussion, we hold that the conviction and sentence passed by the lower court against accused 1 cannot be legally sustained. We set aside the said conviction and sentence and in allowing this appeal the appellant is acquitted. His bail bonds are cancelled and he is set at liberty forthwith.

5.14.8 Fingerprints provide Definite Link[15]

As regards fingerprints on the '*dibbi*' article 2, it was contended that there is absolutely no evidence to show that the fingerprints were not tampered. It was vehemently argued that the prosecution has led no evidence to show that the fingerprints on the '*dibbi*' article 2, remained intact from that date of seizure to the date they were sent to the fingerprint expert. It was also contended that the fingerprints were sent after an inordinate delay. *Dibbi* article 2 was seized on 9-9-73. But it was sent to the fingerprint expert on or about 29-6-74 *vide* Ex. P 45 and Ex. P 46. The seal with which these fingerprints were sealed was not kept with any independent person. Reliance was placed on *Mahmood v State of Uttar Pradesh*, 1976 Cr LJ 10 : AIR 1976 SC 69 : (1976) 1 SCC 542, wherein it has been held as under:

In a case dependent wholly on circumstantial evidence, the court before recording a conviction on the basis therefore must be firmly satisfied:

(a) *that the circumstances from which the inference of guilt is to be drawn, have been fully established by unimpeachable evidence beyond a shadow of doubt;*

(b) *that the circumstances are of a determinative tendency unerringly pointing towards the guilt of the accused; and*

(c) *that the circumstances, taken collectively, are incapable of explanation on any reasonable hypothesis save that of the guilt sought to be proved against him.*

In the instant case these conditions have not been satisfied. The solitary piece of circumstantial evidence on which the prosecution has stated their case, was too shaky, suspicious and fragile to furnish a sound foundation for conviction. The conviction for the murder rested on the solitary circumstances, *viz.,* that the fingerprints of the accused were found on the handle of the *gandasa* which was found lying near the dead body at the scene of occurrence. But it was found that the investigator did not take all the necessary precaution which could be taken to eliminate the possibility of fabrication of this evidence or to dispel suspicion as to its genuineness. Admittedly, he sealed the box with his seal which thereafter remained with him throughout.

Furthermore, the specimen fingerprints of the accused were not taken before or under the order of a magistrate in accordance with section 5 of the Identification of Prisoners Act.

Even if it is assumed that the handle of the *gandasa* bore the fingerprints of the accused, then also it would not inexorably and unmistakably lead to the conclusion that the accused, and none else was the murderer, unless it was firmly proved further that the fatal injury to the deceased was caused with this weapon. Definite proof of this link was lacking in

15. *Shankaria v State of Rajasthan,* AIR 1978 SC 1248 : 1978 Cr LJ 1251 (SC).

this case. The missing link could be best supplied by showing that there was blood on this *gandasa*, and that blood was of human origin. But this was not done.

Further, the inspector of the Scientific Laboratory has not given any reasons in support of his opinion. Nor has it been shown that he has acquired special skill, knowledge and experience in the science of identification of fingerprints. It would be highly unsafe to convict one on a capital charge without any independent corroboration, solely on the bald and dogmatic opinion of such a person, even if such opinion is assumed to be admissible under section 45, Evidence Act.

Reliance was also placed on the *State v Motia,* ILR (1953) 3 Raj 655, wherein it has been held as under:

Wherever it is desired by the prosecution that certain articles, which have been recovered from accused persons are to be identified, or are to be sent to the chemical examiner for analysis, it is necessary that the officer recovering the articles should immediately take steps to seal them, and evidence should be produced by the prosecution that from the time the articles come into possession of the police to the time they were sent for identification before a magistrate or for examination to the chemical examiner the seals remained intact. In the absence of such precautions it would always be open to the accused to say that the police later put human blood on the articles in same reliance cannot be placed on the discovery of bloodstains on the articles recovered as would be done if necessary precautions are taken:

Further, it is also necessary for the prosecution to prove by evidence that the articles sent to the chemical examiner for analysis, were the very articles which were recovered from the accused.

Reliance was placed on *Hanuman v State of Rajasthan,* 1974 Raj LW 159 : 1974 WLN 95, wherein it was observed that the delay in sending empty cartridge cases and other incriminating articles to the forensic expert was not explained, the accused could not be convicted where the prosecution has been guilty of such dereliction of duties.

On behalf of the State, reliance was placed on *Ukha Kolhe v State of Maharashtra,* AIR 1963 SC 1531 : (1963) 2 Cr LJ 418 : (1964) 1 SCR 926, wherein it was held as under:

Rules 3, 4 and 5 of the Bombay Prohibition (Medical Examination and Blood Test) Rules deal with the medical examination of a person who is produced before a registered medical practitioner under sub-section (1) of section 129A. To an examination to which section 129A does not apply, the Rules would have no application. The law not having prescribed a particular method of submitting specimen of blood collected from an accused person when blood has been collected before any investigation has started, it is unnecessary to consider the argument whether the expression "duly admitted" used in section 510 of the Code of Criminal Procedure means merely in the manner prescribed by rules in that behalf or submitted after taking adequate precautions for ensuring its safety and the blood specimen was collected by a medical practitioner before investigating and thereafter it was handed over to the police officer on demand by him and ultimately submitted to the chemical examiner for his examination, it would be regarded as "duly submitted" within the meaning of section 510, Cr.P.C.

There is no doubt that the prosecution has failed to lead evidence that the fingerprints on the '*dibbi*' article 2, were not tampered with from 9-9-1973 to 29-6-1974 when they were sent to the fingerprint expert. As stated above, there is ample evidence on the record that when the '*dibbi*' article 2 was recovered it was sealed. P.W. 22, Kashi Prasad, has stated that the seals of article 2 were intact when they were sent to the fingerprint expert. P.W. 18 Mr. Tankha has also stated that the seals on article 2 were intact when they were received by him. The most important thing, which is to be kept in mind, is that the fingerprints of one individual do not tally with the fingerprints of any other individual. The science of fingerprint is by itself a complete science for the purposes of identification. In what manner the fingerprints of the accused Shankariya on article 2 '*dibbi*' could be tampered with, has not been argued or suggested. The fingerprints on article 2 have, on examination, been found to tally with the specimen fingerprints of the accused. Tampering of fingerprints on article 2 would mean that some other fingerprints were superimposed or substituted.

But no other fingerprints could be substituted or superimposed which would resemble and tally with the fingerprints of the accused Shankariya. Accused Shankariya in his statement under section 342, Cr.P.C. recorded on 14-6-1974 and 23-6-1974 has not categorically stated that his fingerprints were obtained on an article like the iron '*dibbi*' article 2. In the absence of such a plea by the accused Shankariya, the non-production of some evidence on the part of the prosecution that the fingerprints were kept intact during all this period, loses all its importance. It was also argued that the fingerprints could not subsist for such a long period of 9 months. It has been mentioned in several books on "fingerprints" that fingerprints survive for quite a good number of years. In view of these circumstances, we have no hesitation in holding that the fingerprints on the iron '*dibbi*' article 2 tally with the specimen fingerprints of the accused Shankariya and the non-production of any evidence on behalf of the prosecution to the effect that the fingerprints remained intact during these 9 months does not in any way detract the veracity of the prosecution version, as the fingerprints on the '*dibbi*' article 2, could not be tampered with. As a matter of fact, as stated above, the fingerprints could neither be substituted nor superimposed and therefore, the apprehension of the defence that the fingerprints could be tampered with, in the absence of such an evidence, is wholly unfounded.[1]

Supreme Court's view:

During his examination at the trial, the appellant did not say in positive specific terms, that after his arrest, he was made to handle the *Dibbi* (article 1). What the appellant then stated on this point was as follows:

The police had taken many moulds in the police station after my arrest so also many palm impressions on various things were made. I do not know whether the dibbi was included amongst them or not. When the evidence of the fingerprint expert, Mr. P.N. Tankha (P.W. 18), to the effect that one finger impression on the dibbi*, article 1, tallied with the fingerprint of the left hand of the accused was put to Shankaria, the latter answered: "The witness tells false". This reply would be consistent only with the position that his fingerprints on the dabbi were not taken after his arrest.*

The failure of the appellant to say in categorical terms that after his arrest he was made to handle this dabbi, article 1, cuts at the root of his vague and omnibus plea that all evidence, including that of the foot-moulds, fingerprints, etc., had been fabricated by the police. In the first place, as rightly observed by the High Court, fabrication of the fingerprints in the circumstances of the case was difficult, without superimposition. Secondly, it is impossible to believe that an investigation of the status of a Superintendent of Police, would go to the length of causing substitution of the fingerprints of the accused in place of the original fingerprints of another person on the *'dibbi'*.

Mr. Gambhir next contends that in view of section 5 of the Identification of Prisoners Act, it was incumbent on the police to obtain the specimen thumb impressions of the appellant before a magistrate, and since this was not done the opinion rendered by the fingerprint expert, Mr. Tankha, by using those illegally obtained specimen finger-impressions, must be ruled out of evidence.

The contention appears to be misconceived because in the State of Rajasthan, the police were competent under section 4 of the Identification of Prisoners Act, to take the specimen fingerprints of the accused, and this they did, in the instant case, before the Superintendent of Police, Shri K.P. Srivastava. It was not necessary for them to obtain an order from the magistrate for obtaining such specimen fingerprints.

In view of all that has been said above, the presence of the fingerprint of the appellant on the *dibbi*, article 1, from which cash was stolen at the time of occurrence, is a tell-tale circumstance pointing towards the guilt of the appellant.

5.14.9 The Court's Scrutiny[16]

There is no dispute over the position of law that simply because there is the opinion of the fingerprint expert the court is bound to accept it and base the conviction of the appellant on it. It is a very weighty piece of evidence but nevertheless the court is to consider its weight and is free either to accept or reject it on a thorough discussion and giving sufficient reasons. The court cannot delegate its own function to find a person guilty or not guilty to the expert. He cannot convict simply because the expert says that the man is guilty. The true guidance is received from the judgment of Beaumont, C.J. in the case Fakirmohamed *v* Emperor, AIR 1928 Pat 129.

The court, in a case of this sort, has to rely on the expert upon two distinct points, *first* of all, on the question of similarity between the marks, which is a question of fact on which the court can, and should, with the assistance of the expert satisfy itself: and *secondly* on the point, which is one for expert opinion, whether it is possible to find the fingerprints or thumb-impressions of two individuals corresponding in as many points of resemblance as are shown to exist between the impressions found in the case before the court and those of the accused.

The court should examine the expert as to how much experience he had in the way of comparison of fingerprints and as to how much literature on the subject he had studied.

I will now refer to the decision of Das and Bucknill, JJ. in the case reported in ILR 1 Pat 242. That was also a case under section 82(c) and 82(d) of the Indian Registration Act. Bucknill, J. observed:

I think that, apart from the fact that I should be rather sorry without any other corroborative circumstances to convict a person of a serious crime solely and entirely upon similarity of thumb marks or fingerprints, the very fact of taking of a thumb impression from an accused person for the purpose of possible manufacture of the evidence by which he could be incriminated is in itself sufficient to warrant one in setting aside the conviction upon the understanding and upon the assumption that such was not really a fair trial.

The learned judge was swayed away by the English principles that the accused cannot be compelled to supply incriminating evidence against himself. This point we will discuss later. But it is sufficient to observe here that the observation regarding the fingerprint was rather too general. Das, J. had added a separate note, wherein he discussed the balance of the evidence, and in his opinion, it was entirely in favour of the appellants, the accused persons. That influenced Das, J. to make an observation that it was dangerous to convict the appellants on the sole testimony of the fingerprint expert. In a later decision the court did not stick to the same view. Sir Jwala Prasad and Macpherson, JJ. in the case *Basjit Singh v Emperor,* made a more careful approach to the position. Jwala Prasad, J. in his judgment observed:

As to the probative value of the opinion of an expert on fingerprints, it must have the same value as the opinion of any other expert, such as a medical officer, etc. In each case the evidence is only a guide to the court to direct its attention to judge of its value. The court is at liberty to use its own discretion and to come to a conclusion either in affirmance or differing from the view taken by the expert. In this view, it may be said, as has been held repeatedly in a number of cases, that it is not safe to convict an accused upon the sole testimony of an expert.

But the final conclusion in his Lordship's view is that the court cannot refuse to convict a person on the evidence of a fingerprint expert, merely on the ground that it is unsafe to base a conviction upon such evidence. If the fingerprints are clear enough, the court must verify the evidence of the expert by examining them with a magnifying glass, if necessary, and applying its own mind to the similarities and dissimilarities afforded by the fingerprints, before coming to a conclusion; one way or the other. This decision seems to be more in conformity with the rule laid down by the Chief Justice Beaumont. In our view, the

16. *Bhaluka Behera v State of Orissa*, AIR 1957 Ori. 172 : 1957 Cr LJ 902 : ILR 1957 Cut 200.

direction given in the judgment of the Chief Justice Beaumont referred to above, is a correct and safe guide in matters of this nature and we respectfully follow.

In the instant case, the learned Assistant Sessions Judge has not delegated the duties to the expert of fingerprints. He has not based the conviction simply because the expert says that the fingerprints are identical but on the contrary, on an elaborate, thorough and detailed discussion of the evidence of the expert (P.W. 19), he has agreed with the opinion of the expert. It appears from the judgment that he had also examined the specimen fingerprints and the disputed fingerprints. We have gone through carefully the evidence of the fingerprint expert (PW. 19) and find that he has given very cogent and convincing reasons to come to his opinion. I have also examined the fingerprints with a magnifying glass and agree with the learned Assistant Sessions Judge. The science has developed to a stage of exactitude. But the main thing to be scrutinised is whether the expert's examination is thorough, complete and scientific. The learned Assistant Sessions Judge's approach is in accordance with this direction and we, therefore, find it absolutely safe to convict the accused persons Bhaluka and Kalicharan on the proof of the identity of thumb-impressions on the specimen papers and the disputed ones appearing on the document Ex. 14(4).

5.14.10 Fingerprint Reports[17]

The clinching evidence against the appellant was his thumb impression on the *kunda* of the cash box. It was conclusively proved to be his impression on the opinion of the expert. The report of the expert was used as evidence by the prosecution without examining him in court. Neither the court thought it fit nor the prosecution or the accused filed any application to summon and examine the expert as to the subject-matter of his report. The court was bound to summon the expert if the accused would have filed any such application for his examination. That not having been done the grievance of the appellant apropos the report of the expert being used without his examination in court made in the High Court and repeated in this court had no substance. The evidence of PWs. 13 and 16 against the appellant in court found ample and clinching corroboration from the fact of his thumb impression occurring on the *kunda* of the cash box. Soon after the occurrence during the course of the investigation photographs of the impressions on the *kunda* had been taken long before the appellant was apprehended for his participation in the crime. There was absolutely no scope for any kind of manipulation in the matter as was argued on behalf of the appellant in desperation. We are, therefore, clearly of the opinion that the participation of the appellant in the commission of the robbery at the petrol pump was proved beyond any reasonable doubt; so also the charge under section 342 of the Penal Code.

5.14.11 Identification Basis of Fingerprints[18]

Interest in modern fingerprints identification dates from 1880. With the publication of articles of Henry-Faulds and W.J. Herschel, who was in Indian Civil Service, about uniqueness and permanence of fingerprints, facts which the English Scientist Sir R. Galton was to verify through lengthy systematic observations. Systems of fingerprint classification were developed later by Sir E.R. Henry, formerly of Indian Civil Service and afterwards Chief Commissioner of the London Metropolitan Police and by Juan Vucetich of Argentina. However, the Henry system of classification has been adopted by scores of law enforcement agencies around the world and is the most widely used method of fingerprint classification. All impressions are broadly classified as arches, loops, whorls and composites or compounds and there are further sub-divisions. In arches the ridges run from one side to the other without making backward turn, unlike to loops, whorls or composites. In loop, whorl or composites types there are fixed points, which are known as delta or outer terminus and the core or the

17. *Phool Kumar v Delhi Administration,* AIR 1975 SC 905 : (1975) 1 SCC 797 : 1975 Cr LJ 778.
18. S*tate of Madhya Pradesh v Sitaram Rajput*, 1978 Cr LJ 1220 : 1978 MPLJ 197.

inner terminus. These serve a useful purpose in the classification of fingerprints. Generally there are no deltas or cores in arches. There are also considerable amount of finger details of branching and coalescence of ridges, of island and unlimited quantity of extremely fine pore details along individual ridges. About 5 per cent. of the impressions are arches, 60 per cent loops and 35 per cent. whorls and composites. Loops and whorls always predominate.

For the purpose of comparison of two fingerprints, *i.e.,* the disputed and the specimen, to begin with the patterns are seen. If the patterns are different then the impressions are of different persons. If the patterns are similar then it is seen whether the general flow of the ridges is similar. If the patterns are similar then it is seen whether general flow of the ridge flows are similar, then the ridge characteristics of the two impressions are compared. Two common fixed points are then located. In cases of loops, whorls or composites, core is taken as the inner terminus and the delta outer terminus. Generally speaking, core and delta are not available in cases of arches. So also in partial or blurred impressions such core and delta may not be available. So dot, rod, ridge end, bifurcation, island etc., are taken as the starting point. Similarly outer point is fixed. Having got or fixed the two points, their similarity is determined by counting the number of ridges in between the two points. If the numbers tally, then the sequence of individual ridge characteristics and their relative positions are observed. The points of similarities are then noted. If the relation of each of the points so noted in both the impressions is the same it is an absolute certainty that the impressions are of the same person.

Now the question remains as to how many points of similarities can definitely establish the identity beyond question. The Federal Bureau of Investigation of USA requires twelve and the Scotland yards requires sixteen points of similarities for positive identification. However, some English and American authorities are of the view that if there are five or six 'well-grouped' characteristics and the patterns uncommon, the identification is definite. By well-grouped characteristics, they mean dots, islands, hooks and spurs. If five or six characteristics occur close to one another and in a narrow area, the force of identity is enhanced. In the case of blurred or partial impressions, the view of some of the Indian authors is that if there are three identical points, they would be sufficient to prove the identity. This has been questioned by other Indian authors who insist on at least six points of similarities to establish the identity. The Fingerprints Bureau of different States in India have fixed varying standards, requiring six to twelve points of similarities to determine the identity. In para 88 of the Finger Print Manual of M.P. State it has been observed: "If a sufficient number of ridge characteristics are in complete agreement in the two impressions it can be said definitely that the impressions were made by the same person. However, no definite rule can be laid down for fixing the number of points of similarities. Four or five might be sufficient if there were unusual peculiarities. The consensus of modern opinion is that six, four in sequence, are sufficient to justify a definite opinion being given." It is said that the number is now changed to eight in Madhya Pradesh in view of certain decision of this court. The following extracts from the book *Modern Criminal Investigation* by Soderman and O'Connell may be quoted here in this regard:—

The demand for twelve similar details is the result of the opinion of bygone days, founded on the opinion of Galton, Remus, Balthazard and others. All recent scientists working in the field of dactyloscopy, as for instance, Locard, De Rechter and others, share the opinion that the number of characteristic points which can be noted at the edge of an enlargement is a matter of little importance. A rare detail is an identification sign one hundred times more important than a whole series of forks, four to five details in a centre of an unusual pattern have much more value as evidence than twelve to fifteen forks in the periphery. Some ridges with unusually grouped pores have more weight than the classical twelve points.

The branch of the fingerprint is now a highly developed and technical subject. The classification of fingerprints is a science requiring much study and specialisation in the subject. Therefore, a fingerprint expert is in a more advantageous position to compare fingerprints and point out similarities or dissimilarities between two impressions by critical examination of the impressions. This was recognised by amendment of section 45 of

the Evidence Act in 1899, making opinion of fingerprint expert relevant as was the case with medical and handwriting experts. Section 73 of the Act was also suitably amended, enabling taking of specimen thumb impressions for comparison. Section 510 of the Code of Criminal Procedure was amended in 1955 to make the report of the Director of Finger Print Bureau admissible under that section. The Supreme Court in *Phool Kumar v Delhi Administration,* AIR 1975 SC 905 : 1975 Cr LJ 778 : (1975) 1 SCC 797 has held that when neither the court nor the prosecution or the accused filed any application to summon and examine the fingerprint expert as to the subject-matter of his report, no objection can be taken at the appellate stage by the accused against his non-examination.

Majority of the High Courts have found that it cannot be laid down as a rule of law that it is unsafe to have conviction on the uncorroborated testimony of a fingerprint expert. The true rule seems to be one of caution. The court cannot delegate its authority to the expert but has to satisfy itself as to the value to be given to the evidence of the expert in the same way as to the value given to any other evidence. The reasons given by the expert in arriving at the conclusion are ultimately to be weighed by the court and satisfy itself about the correctness of the conclusion by comparison of the prints. The task of the court becomes much easier when the fingerprint expert has taken enlarged photo prints of the disputed and specimen fingerprints and marked the distinct points of similarities. Otherwise it becomes an uphill task to examine each and every individual prints with magnifying glass when there are large number of prints. If the enlarged photo prints are kept side by side and their marking compared, it becomes much easier to follow the reasonings of the fingerprint expert about points of similarities or dissimilarities and judge the correctness of his conclusion. In *Emperor v Sahdeo,* (1907) 3 Nag LR 1 : 5 Cr LJ 220 it has been observed:

The papillary ridges covering the bulbous points of the human finger and thumb with which finger impressions are produced afford a surer criterion of identity than any other comparable body feature.

Where it is proved by competent expert testimony that two such impressions, made at different times, however far apart, contain several points of agreement and no points of disagreement in their minutiae, no further evidence is necessary to prove that they were made by the same finger.

There are no eye-witnesses in the case and obviously there could be none when the disbursing officer, officer certifying the works, muster-roll clerks and mates who had put their thumb-impression the muster-rolls against the fictitious names of various labourers are all accused persons. As the names of the labourers mentioned in the muster-rolls are all fictitious and to avoid detection the names of their villages were not mentioned and so there was no question of examining any of the labourers to show that they were never paid the wages as shown in the muster-roll. The prosecution case can only succeed if the prosecution is able to prove beyond doubt that the thumb impressions on the muster-rolls are all forged and they are, in fact, the thumb-impressions of the various respondents. The prosecution case, therefore, hinges on the evidence of fingerprint experts. We have the report, Ex. P. 143, of the Director of Finger Print Bureau which is admissible in evidence under section 510 of the Code although he has not been examined as a witness. We have also the report, Ex. P. 142 of Shri Vinayak (P.W. 53) who has been examined in court. The learned judge found the evidence of the fingerprint expert to be not satisfactory and he has given cogent reasons for arriving at this conclusion. It cannot be said that the reasoning of the learned judge is either perverse or unreasonable. In an appeal against acquittal it is not open to interfere even if another view of the evidence is reasonably possible, but here we are satisfied that the reasonings are well merited and there is nothing to differ from the view taken. There were in all about 320 disputed thumb-impressions which were alleged to be those of respondents Hari Singh, Dalu, Khuman Singh, Makhan Singh and Maharaj Singh and were referred to the fingerprint experts. The experts found that out of these 320 impressions some are smudged and are not fit for comparison, still the experts were left with quite a large number of legible fingerprints and it was not at all difficult to conclusively prove that the disputed

fingerprints tally with the fingerprints of the aforesaid respondents. The fingerprint expert Vinayak, (P.W. 53) had taken photo enlargement of only 12 disputed prints. He has also given his reasonings only in respect of these 12 prints though he stated that he had examined the other legible disputed prints with the specimen and he found them to be similar by examining the other prints which were not enlarged by the magnifying glass. It may be mentioned that the reports Ex. P. 142 of Shri Vinayak and Ex. P. 143 of the Director do not tally in all respects. In Ex. P. 142 of Shri Vinayak questioned prints 442, 446, 465, 468A, 468C and 468D are shown as identical but the Director has stated in the report that these prints are unfit for comparison. Questioned prints 550, 554, and 554A have been stated by the expert to be identical but there is no such report about them by Director. Similar is the case with regard to prints 606 and 606A. If there are points of similarities between disputed and specimen prints there is no reason why the expert should differ.

Shri Vinayak admits that the best course to follow is to prepare enlarged photographs of the disputed and specimen prints to the same scale. Then, on the photographs a line may be drawn to connect the centre and the junction points. The lines between the two points should now be carefully counted. The next step is to find out how many agreements in detail there are on either side of the drawn line, such as free ends, forks, ellipses, tongues and rods and to see how they are situated as regards their relative positions with one another. One should also verify that the general pattern is the same in both, but he clearly admits that he did not consider the pattern of the prints. He has failed to take enlarged photographs of all the disputed prints which were subject to examination and comparison by him. He has not marked two fixed points nor drawn a line between the two points, nor he has counted the number of ridges in between. Although he admits that most of the disputed fingerprints were quite legible, still he has only marked out six points of similarities in each of 12 enlargements of the disputed fingerprints. His opinion is mainly based on the ridge characteristics which agree in nature and relative position. Perhaps, he has followed the instructions in the Finger Print Manual of M.P. State but in the Manual it is mentioned that 4 or 5 points of similarities might be sufficient if there are unusual peculiarities. Though normally six points of similarities, four in sequence, are sufficient to justify a definite opinion being given. It is not the opinion of Shri Vinayak that any of these prints had unusual peculiarities nor he has stated that at least four points of similarities were in sequence. This apart he has contradicted his report in the cross-examination in respect of several items. About photo enlargement, Ex. P. 126, he has mentioned that to the east of point no. 3 there is west-ward bifurcation with no ridge intervening but in cross-examination he admitted that point No. 4 is an end of a ridge. Similarly with regard to photo enlargement, Ex. P. 128 he has mentioned that point No. 1 is the end of a ridge and to the east of point No. 3 and after the intervention of 3 ridges there is end of a ridge but in cross-examination he admitted that point No. 1 is an upward bifurcation and is not end of a ridge and point No. 4 is also bifurcation and is not end of a ridge. Under the circumstances the prosecution has failed to prove beyond doubt that the thumb-impressions on the muster-rolls are forged. The prosecution has also failed to show that no work, in fact, has been executed in respect of which these payments were made as per these 13 muster-rolls. We, therefore, find no reason to interfere with the acquittal.

5.14.12 Fingerprint Recovery Doubtful[19]

The only incriminating circumstance on the basis of which the High Court upheld the conviction of Mohd. Aman is that his fingerprints were found on a brass jug in the house of the deceased. From the evidence adduced in proof of the above circumstance it appears that the brass jug, together with other articles, was seized, packeted and sealed on April 14, 1983 and forwarded to the Fingerprint Bureau five days after – on April 19, 1983 to be precise—through Constable Mohd. Sadique (P.W. 4) along with a letter written by the Investigating Officer (copy of which was marked as Ext. P. 59). On the following day, that is, April 20,

19. *Mohd. Aman v State of Rajasthan,* AIR 1997 SC 2960 : 1997 AIR SCW 2980 : 1997 Cr LJ 3567.

1983 the Bureau sent the articles back after taking photographs of the chance prints found on the jug and three other articles (out of the sixteen sent) with a corresponding letter (Ext. P. 60). After Mohd. Aman was arrested on April 20, 1983 his specimen fingerprints were taken by Head Constable Ramji Ram (P.W. 24) and forwarded to the Bureau on May 24, 1983. As the prints were not clear, the same was returned by the Bureau asking for better prints. Specimen fingerprints were thereafter again taken on June 20, 1983 and sent to the Bureau. These prints were also sent back and for the third time prints of Mohd. Aman was taken and sent to the Bureau on June 30, 1983. Thereafter the Bureau gave its report (Ext. 115) with the opinion that the chance fingerprints found on the brass jug were similar to and identical with his specimen fingerprints.

After careful perusal of the evidence adduced in proof of the above circumstance we notice a glaring missing link, in that the prosecution had failed to establish that the seized articles were not – or could not be – tampered with before it reached the Bureau for examination. Though evidence was led to prove that after seizure the articles were packaged and then sealed, no evidence was led to indicate what was the mark given in the seals and whether the Bureau received the packages with the marked seals intact. Indeed, even the contemporaneous letters exchanged between them (Ext. P. 59 and P. 60) do not throw any light on this aspect of the matter. Rather, other circumstances appearing on record makes the prosecution case doubtful in this regard: first, the articles were kept in the police station for five days without any justifiable reason, secondly the Investigating Officer (P.W. 20) admitted that the seal, mark of which was put on the articles, was with him since the time of seizure and lastly his letter (Ext. P. 59) forwarding the seized articles to the Bureau contains admittedly, an overwriting as regards the date of its writing/despatch and no satisfactory explanation is forthcoming for the same. Apart from the above missing link and the suspicious circumstances surrounding the same, there is another circumstance which also casts a serious mistrust as to genuineness of the evidence. Even though the specimen fingerprints of Mohd. Aman had to be taken on a number of occasions at the behest of the Bureau, they were never taken before or under the order of a Magistrate in accordance with section 5 of the Identification of Prisoners Act, 1920. It is true that under section 4 thereof police is competent to take fingerprints of the accused but to dispel any suspicion as to its *bona fides* or to eliminate the possibility of fabrication of evidence it was eminently desirable that they were taken before or under the order of a Magistrate. The other related infirmity from which the prosecution case suffers is that the brass jug, production of which would have been the best evidence in proof of the claim of its seizure and subsequent examination by the Bureau, was not produced and exhibited during trial – for reasons best known to the prosecution and unknown to the court. For the foregoing discussion we are unable to sustain the convictions of Mohd. Aman.

To prove the role of Mohd. Yusuf (the other appellant in Criminal Appeal No. 1749 of 1996) the prosecution relied upon the find of his fingerprint on a glass tumbler and his footprints in the house of the appellant, recoveries of four silver rings belonging to the wife of the deceased and a knife pursuant to his statement. It is rather surprising that even though the investigating agency claimed to have made a searching examination of the house of the deceased on April 14, 1983 and, to have seized on that day sixteen articles, four of which contained fingerprints, the glass tumbler containing the fingerprints was seized and the footprints were noticed on April 24, 1983. When considered in the context of the fact that he was in custody of the police at that time the possibility of fabrication of evidence to implicate him as contended by him, cannot be altogether ruled out. This apart, some of the reasons which weighted with us for not accepting the evidence regarding the find of fingerprints, namely that there is a missing link between the identity of the articles seized and identity of the articles examined by the Fingerprint Bureau and non-production of the glass tumbler during trial also persuade us not to accept the evidence adduced in proof of the above circumstance. So far as the footprints are concerned, another reason for which we feel it unsafe to accept the evidence led in this regard is that the sample footprints were not taken before a Magistrate. This apart, the science of identification of footprints is not a fully developed science and, therefore, if in a given case unlike the present one – evidence

relating to the same is found satisfactory it may be used only to reinforce the conclusions as to the identity of a culprit already arrived at on the basis of other evidence. That brings us to the evidence relating to the recovery of the four silver rings (Exts. P. 5 to P. 8) belonging to the wife of the deceased pursuant to the statement made by Mohd. Yusuf. To persuade the court to hold that the above circumstance stood established the first and the foremost fact which the prosecution was required to prove was that those articles belonged to the wife of the deceased and that they were stolen at the time of the commission of the murder. Having gone through the evidence on record we are constrained to say that the prosecution has not been able to establish those two facts and, therefore, we need not go into the question whether the evidence led by the prosecution relating to their recovery from Mohd. Yusuf is reliable or not. The First Information Report, that was lodged by Sabir Hussain (P.W. 10), did not give any list of articles that were stolen. He, however, claimed to have later on given a written statement containing such a list to the Investigating Officer and this statement was exhibited. In our considered view the trial court was not justified in entertaining the statement as an exhibit because it was hit by section 162, of the Code of Criminal Procedure. Be that as it may, P.W. 10 and Bano (P.W. 2), another relation of the deceased, testified that within a day or two of the murder they could ascertain what articles were missing from the house. The evidence of these two witnesses on this aspect of the matter cannot be safely relied upon for they admitted that they did not have access to the house till May 1, 1983 as it was in custody of the police and, therefore, they could not have occasion to know what articles were stolen. Even if we proceed on the assumption that the seized articles belonged to the wife of the deceased the prosecution has led to no evidence, either direct or circumstantial, to prove that they were stolen at or about the time when the murder took place. In other words, unless the prosecution conclusively establishes that the articles recovered were stolen when the murder was committed, and not on an earlier occasion, there would be a missing link in the chain so far as the specific accusation levelled against the accused is concerned. Once it is found that the evidence relating to finding of foot-prints and fingerprints of the appellant and the recovery of the four silver rings cannot be safely relied upon, the proof of the other two circumstances, namely that a blood-stained knife was recovered after fifteen days of the incident pursuant to the statement of the accused and that few simple injuries were found on his person on April 20, 1983 when he was arrested would only raise a strong suspicion against him and not a conclusive inference of his guilt. The conviction of Mohd. Yusuf, therefore, cannot also be maintained.

5.14.13 Fingerprint Evidence Rejected[20]

This appeal is preferred impugning two judgments and decrees passed by the learned appellate court below namely the learned Additional District Judge, Midnapore in Title Appeal No. 121 of 1984 and the learned trial Judge, *viz.,* the learned Assistant District Judge 3rd court at Midnapore in Title Suit No. 115 of 1976. Both the learned court below held in favour of the respondent Nos. 1 and 2 who were the plaintiffs in the suit. The suit filed by the respondent Nos. 1 and 2, the plaintiffs, amongst other was principally for partition and administration of the properties left behind by one Nandalal Adak, since deceased. In the said suit another relief has been claimed by the plaintiffs for declaration that the deed of gift allegedly executed by Nandalal Adak, since deceased in favour of the appellants herein is not binding upon the plaintiffs and the same are forged and fabricated document. The bone of contention in the present appeal as well as the suit is whether the said deed of gift dated 5th August, 1973 is a valid and lawful document or not. In other words, whether or not the said deed of gift was validly and lawfully executed by Nandalal Adak, since deceased. Both the learned courts below held that the said deed of gift is a fabricated document and the same has not been executed and registered by Nandalal Adak lawfully. During the pendency of the appeal in this court the plaintiff No. 1 along with the appellants herein made an application in this Hon'ble court for compromise. In the

20. *Dulal Chandra Adak v Gunadhar Patra*, AIR 1998 Cal 150 : 1998 Cal WN 190 : 1998 (2) CCC 473.

said compromise petition filed on 10 March, 1988 the plaintiff/respondent No. 1 has categorically stated that the said deed of gift was validly and lawfully executed by Nandalal Adak. In his petition the plaintiff No. 1 has in effect contradicted his own stand in the plaint. At the time of hearing both the parties agreed that I should decide the suit itself, on the basis of the material available before me, as both the judgments and decrees of the learned court below are liable to be set aside under the law. It is submitted jointly that I can do so under O XLII, rule 1 read with O XLI, rule 24 of the Code of Civil Procedure.

Mr. Tarak Nath Roy, the learned advocate appearing in support of the appeal, submits that both the learned courts below have gone wrong while declaring that the said deed of gift is fabricated document upon impersonation. Both the learned courts below came to the conclusion on the basis of evidence of the fingerprint expert and without considering rather brushing aside the direct evidence adduced by the appellants. It is also his submission that averments made in the plaint are inconsistent and/or contradictory inasmuch as the plaintiffs on the one hand admitted the execution and signature of the donor by making out case of undue influence and misrepresentation, on the other hand the plaintiffs have denied and disputed the execution and registration of the donor alleging impersonation and forgery. Therefore, he submits these two allegations cannot run side by side. It is his submission further that where there is a case of undue influence and misrepresentation, the genuineness of the signature and/or thumb impression of the author of the document is admitted. But in the case of forgery and/or impersonation the question of undue influence and misrepresentation is beyond question. He submits further that in the said compromise petition one of the plaintiffs has categorically admitted that the said deed of gift is a valid piece of document, such admission squarely binds another plaintiff namely the other respondent under section 18 of the Evidence Act, 1872. Mr. Roy further submits that the learned trial Judge has exceeded his jurisdiction by not following the order of direction given by the learned appellate court below passed in the order of remand dated (*sic*).

Mr. Basu appearing for the respondent No. 2 submits that all the materials and evidence are galore whereby it will be evidence that the said alleged deed of gift is a forged one. Mr. Basu submits that the case of undue influence and misrepresentation on behalf of his client is not pressed. His client wants to proceed on the basis of forgery. He urges that he should decide this suit on the question of fraud and forgery. He submits it will appear from the evidence of the fingerprint expert and his report that the thumb impression was not put by Nandalal Adak since deceased but by one Kanailal Bara. Therefore, when there is evidence of an expert both oral and documentary on this specialised subject, the court should accept his evidence not other evidence.

Mr. Roy submits in reply to the argument of Mr. Basu that the execution, attestation and registration have been proved by the witness who have personal knowledge of the same. He submits that the evidence of the writer of the document has not made any dent in the cross-examination nor such evidence has been declared to be unbelievable or unacceptable by both the learned court below. He argues that expert evidence cannot overweigh direct evidence. Moreover, in view of the admission of one of the plaintiffs it beyond doubt establishes genuineness and validity of the document. Therefore, the evidence of the learned both the courts below are liable to be set aside as well as the suit should be dismissed.

I have heard the respective submissions of both the parties. I have examined all the materials and evidence on record. As both the parties have agreed to that I should decide the suit itself by exercising my power under O XLII, rule 1 read with O XLI, rule 24 of the Code of Civil Procedure, I accordingly do so. The reasons for exercising my power as above is that both the learned courts below have relied on the evidence of the fingerprint expert and nothing else though the other evidence materials were available. The reasons of the learned appellate court below is that no amount of oral evidence can outweight the opinion of the expert in this regard. In my view this is absolutely wrong approach under the law. The settled proposition of the law is just the reverse and that has been decided by the two decisions reported in AIR 1962 Ori 7,

AIR 1981 (NOC) 93. Both the two decisions have settled that the evidence of the expert cannot outweigh the direct evidence. Moreover, the evidential value of the handwriting expert opinion is not a substantive one but a corroborative. The opinion of the handwriting expert can be taken into consideration under (the ordinary circumstances, when there is a clear and direct evidence for purpose of corroboration only. This proposition has been settled by the decision of the Apex Court of this country reported in *Shashi Kumar Banerjee v Subodh Kumar Banerjee*, AIR 1964 SC 529. In paragraph 21 of the said judgment it is amongst other held ".....besides it is necessary to observe that experts evidence as to handwriting is known evidence and it can rarely, if ever, takes the place of substantive evidence. Before acting on such evidence it is usual to see if it is corroborated either by clear direct evidence or by circumstantial evidence....."In this case there is no clear direct evidence adduced by the plaintiffs/respondents as observed by me as aforesaid nor there is any circumstantial evidence exist which can take the help of the corroborative evidence of the fingerprint expert. In this case both the learned court below even did not touch nor even consider the direct oral evidence. Both the learned court below even did not discard the evidence adduced by the defendants of the attestation and execution. On these grounds alone the judgment and order of the courts below are liable to be set aside. After doing so I could have remanded the suit for trial but I have refrained myself from doing so as this is a suit of 1975. Accordingly, I have accepted the submission and agreement of both the parties to decide the suit itself.

I have taken into consideration all the materials placed before me up to the stage of the second appeal. It will appear from the plaint that the basis of impugning the deed is undue influence, misrepresentation (in paragraphs 14 and 16 of the plaint, and fraud forgery, impersonation and fabrication in paragraphs 17 and 19). This allegation of undue influence and misrepresentation, however, at the appellate stage have been withdrawn altogether by one of the plaintiffs being plaintiff No. 1. The allegation has been denied in the written statement by the defendant. The plaintiffs have not been able to bring any witness or adduce any evidence directly to rebut direct evidence of defendants on the point of registration and execution and attestation. The plaintiffs relied on the evidence of the fingerprint expert only. The evidence of the plaintiffs themselves cannot be accepted as they cannot have any personal knowledge and/or direct evidence as to the execution, attestation of the said deed of gift. Moreover, the allegations made in the plaint on the fact of it are inconsistent and/or contradictory. Mr. Roy rightly submits that the allegation of undue influence, misrepresentation cannot run side by side with the allegation of forgery and fabrication. The allegation of undue influence, fraud and misrepresentation admits of automatically, beyond any doubt, the genuineness of the signature. Therefore, going by the averments made by the plaint itself, the said document has been signed and executed by the donor. Of course, Mr. Basu tries in the second appellate court, to improve upon his client's case by abandoning the case of undue influence, misrepresentation. In my view, this cannot be done under the law at the appellate stage by the learned counsel by making oral submission, as the averment made in the pleading having effect of admission, cannot be allowed to be abandoned without the same is explained away by cogent and proper evidence. At this second appellate stage, plaintiff No. 1 has not come forward to explain away such admission genuineness of signature. Rather, plaintiff No. 2 who was compatriot of the main action has categorically admitted the case of the defendant Nos. 1 and 2. Accordingly, by reason of inconsistent and contradictory case made out in the plaint and further admission of the co-plaintiff and oral direct evidence adduced by the defendants, I hold that the report and evidence of fingerprint expert are of no assistance on the point of execution and registration of the deed of gift in question. The admission of one of the parties having the same interest with that of another party who are fighting jointly for the same interest squarely binds the other. This proposition of law will be apparent from the provisions of section 18 of the Evidence Act, 1872, which is reproduced below:

Statements made by a party to the proceeding, or by an agent to any such party, whom the court regards, under the circumstances of the case, as expressly or impliedly authorised by him to make them, are admissions.

Statements made by parties to suits, suing or sued in a representative character are not admissions, unless they were made while the party making them held that character.

Statement made by—

(1) persons who have any proprietary or pecuniary interest in the subject-matter of the proceeding, and who make the statement in their character of persons so interested, or

(2) persons from whom the parties to the suit have derived their interest in the subject-matter of the suit, are admissions, if they are made during the continuance of the interest of the persons making the statements.

My above view finds support also from the old decisions of this court reported in AIR 1917 Cal 487 : AIR 1918 Cal 971 : AIR 1963 Ori 45.

It appears from the materials that, apart from the admission of the plaintiff No. 1, and the direct oral evidence of the DW 1, DW 2 and DW 3 beyond doubt prove lawful, valid, attestation, execution of the said deed of gift. In that view of the matter, now the plaintiff No. 2 has failed to prove (the case made out in the plaint. Accordingly, the suit is dismissed and judgment and decree passed by the learned both the courts below are set aside. In result, appeal succeeds and is allowed on contest with costs as against respondent No. 2 assessed at Rs. 1,020.

On 30 September 1997, Mr. Roy, learned advocate prays for stay of operation of the judgment and order. In my view, there is a substantial question of law involved in this matter and the same requires some consideration by the apex court. Accordingly, the stay is granted for a period of four weeks after a long vacation, certified copy of this judgment and order shall be given on urgent basis, if applied for.

5.14.14 Judge not to Act as Fingerprint Expert[21]

In this case, inasmuch as the execution of promissory note itself has been disputed, the thumb impression as available in the suit promissory note, is very much under dispute and requires to be either substantiated or disproved by the parties. As far as the trial court is concerned, the court took into account the circumstances that the plaintiffs had filed a petition for sending the document along with the admitted thumb impression to the expert. However, the plaintiffs did not take further steps to pursue the petition filed by them in the said context. Inasmuch as the thumb impression was disputed the initial burden of proving the thumb impression was very much on the plaintiffs. Therefore, and also in consideration of other circumstances the learned trial Judge came to the conclusion that the suit promissory note was not properly proved. However, the learned appellate Judge on a mere comparison of the disputed thumb impression along with the thumb impression of the defendant in the written statement had come to the conclusion that both were the same and that there was absolutely no difference or variation between the two thumb impressions. The question is as to whether the approach of the learned appellate Judge can be sustained or not. Mr. M.M. Sundaresh, learned counsel for the appellate has referred to several judgments in support of his submission that such a comparison by the court in the absence of the opinion of the expert cannot be safely relied upon.

Reliance is placed on the judgment of the Supreme Court reported in *O. Bharathan v K. Sudhakaran,* JT 1996 (2) SC 384 : AIR 1996 SC 1140 : 1996 AIR SCW 685. It was a case arising under Representation of the Peoples Act, in which the Supreme Court has held that in the judgment under appeal the learned Judge ought not to have taken the hazardous task of adjudicating upon the genuineness and authenticity of the signatures in question even without the assistance of a skilled or trained person whose services could have been easily availed of. The Supreme Court relied on an earlier judgment *State (Delhi Administration) v Pali Ram,* AIR 1979 SC 14 : 1979 Cr LJ 17 : (1979) 2 SCC 158. In the said judgment the Supreme Court has held that there was no legal bar to the Judge using his

21. *Bomma Naicken v Chinna Gounder,* AIR 1998 Mad. 375 : 1999 (1) CCC 190 : 1998 (3) Mad LW 407.

own eyes to compare the disputed writing with the admitted writing even without the aid of the evidence of any handwriting expert, but the Judge should, as a matter of prudence and caution, hesitate to base his finding with regard to the identity of a handwriting which forms the sheet-anchor of the case and that it was therefore, not advisable for a Judge to take upon himself the task of comparing the admitted writing with the disputed one.

Reference was also made to another judgment of the Supreme Court *Fakhruddin v State of Madhya Pradesh,* AIR 1967 SC 1326 : (1967) 1 SCWR 449 : 1967 Cr LJ 1197. The Supreme Court after analysing sections 45, 47 and 73 of the Evidence Act, came to the following conclusion (paras 10 and 11):—

Evidence of the identity of handwriting receives treatment in three sections of the Indian Evidence Act. They are sections 45, 47 and 73. Handwriting may be proved on the admission of the writer, by the evidence of some witnesses in whose presence he wrote. This is direct evidence and if it is available the evidence of any other kind is rendered unnecessary. The Evidence Act also makes relevant the opinion of a handwriting expert (section 45) or of one who is familiar with the writing of a person who is said to have written a particular writing. Thus, besides direct evidence which is of course the best method of proof, the law makes relevant two other modes. A writing may be proved to be in the handwriting of a particular individual by the evidence of a person familiar with the handwriting of that individual or by the testimony of an expert competent to the comparison of handwritings on a scientific basis. A third method (section 73) is comparison by the court with a writing made in the presence of the court of admitted or proved to be the writing of the person.

Both under section 45 and section 47 the evidence is an opinion, in the former by a scientific comparison and in the latter on the basis of familiarity resulting from frequent observations and experience. In either case the court must satisfy itself by such means as are open that the opinion may be acted upon. One such means open to the court is to apply its own observation to the admitted or proved writings and to compare them with the disputed one, not to become a handwriting expert but to verify the premises of the expert in the one case and to appraise the value of the opinion in the other case. This comparison depends on an analysis of the characteristics in the admitted or proved writings and the finding of the same characteristics in large measure in the disputed writing. In this way the opinion of the deponent whether expert or other is subjected to scrutiny and although relevant to start with becomes probative. Where an expert's opinion is given, the court must see for itself and with the assistance of the expert come to its own conclusion whether it can safely be held that the two writings are by the same person. This is not to say that the court must play the role of an expert but to say that the court may accept the fact proved only when it has satisfied itself on its own observation that it is safe to accept the opinion whether of the expert or other witnesses.

Therefore, according to the Supreme Court, comparison of two disputed signatures would depend upon the analysis of the characteristics in the admitted or proved writing and that the opinion of the deponent whether by an expert or otherwise is subject to scrutiny by the court. Where an expert's opinion is given, the court must see for itself and with the assistance of the expert come to its own conclusion whether it can safely be held that the two writings are by the same person.

In contrast, Mr. A.K. Kumaraswamy learned counsel for the respondents, relies on a judgment of a Division Bench of this court reported in (1993) 1 Mad LW 186 (*Muniswamy R. v P. Pandiarajan*, A.S. No. 107 of 1983, decided on 3 December 1992 (Madras High Court)) in which the Division Bench has held that it was open to the court to compare the disputed signature in a document without calling for an expert witness.

The outcome of the above judgments would be that even though there is no bar for the court to compare the admitted signatures with the disputed signatures to come to its conclusion it would be prudent to require the assistance of an expert witness. In fact all the judgments cited by both the parties related to signatures and not thumb impression. It cannot be disputed that thumb impression would stand on a different footing when compared to signatures and the variations in thumb impression cannot be easily Judged by naked eyes. That being so the caution emphasised in the judgment of the Supreme Court reported in (AIR 1979 SC 140 supra) and as followed in the subsequent judgment reported

in *O. Bharathan v K. Sudhakaran,* JT 1996 (2) SC 384 : AIR 1996 SC 1140 : 1996 AIR SCW 685 (*supra*) has to be borne in mind in the present case more so because the dispute is with reference to a thumb impression. Once it is concluded that the disputed signature is that of the defendant all the other disputes raised by the defendant in the matter of execution of the promissory note would be naturally thrown out and the plaintiffs would be entitled to a decree as prayed for. In a case of this type, the lower appellate court ought not to have resorted to a mere comparison without seeking the assistance of an expert.

In the result, the appeal has to be remanded back to the lower appellate court for sending the documents for the opinion of the expert and thereupon take evidence of necessary only in the context of the opinion of the expert and record his finding thereon. The lower appellate court is directed to send the document for the opinion of the expert of the expenses of the plaintiffs/respondents and to proceed further.

Fig. 6.1

Then Le Dru knelt, removed his own left shoe. The first joint of the big toe of the left foot was missing. The plaster cast tallied with his left foot exactly. "I, messieurs," he said, "am the murderer" Le Dru 1888.

6.1 GENERAL

The culprit approaches, stays and then leaves the scene of occurrence. He leaves track marks on and around the place in the form of prints and impressions (collectively called 'marks') of feet, shoes, tyres, hoofs and the like. The evidence often connects the criminal with the crime conclusively. It should, therefore, be properly understood/collected/evaluated and used in the dissemination of justice.

Track marks are available in most of the situations. The criminals know the evidentiary value of fingerprints. They are not aware of the importance and utility of the foot, footwear or tyre evidence that, like fingerprints, they can link them with the crime. They, consequently, do not bother about the track evidence. The evidence, therefore, is available in most of the cases. It is handled expeditiously, lest it is mutilated.

6.1.1 Utility

The track marks help the criminal justice system in many ways, including the following:

1. They establish the presence of the culprit at the scene of occurrence.
2. They give the number of the culprits if the visitors or others do not trample the scene and destroy the marks.
3. They help to track down the criminals to their houses or hide-outs, especially in India where most of the people live in rural areas and the criminals, often follow untrodden routes; fields, gardens and stream beds. They leave track marks on routes used before and after the commission of the crime.

   In an infamous murder case, the trackers were able to follow the track of the culprits for miles. The charting of the route ultimately proved useful as the persons who had met the culprits en route proved useful witnesses. (CH)
4. They help to ascertain the type of vehicle used: whether it is a cycle, scooter, car, bus, truck, tractor, rickshaw, bullock cart or a buggy. It is possible to identify the individual vehicle from the tyre marks in some cases. They also indicate the number of vehicles used.
5. They indicate the animals/beasts involved in a crime. For example, a horse or a camel may be used for transport or escape; a cow, a buffalo or a bullock may be stolen or a dog or a tamed wild beast, like a snake or a tiger may be used to destroy or kill a human being or a domestic animal. The type of the animal or the beast has its characteristic track marks. They may permit identification of the individual animal also, in some rare cases.

6.1.2 Misconceptions about Track Evidence

The track marks evidence is misunderstood and hence not fully utilized in India. The Apex court [1] (the Supreme Court) has dubbed it as a **'Rudimentary Science'** and that **'not much reliance can be placed on track mark evidence'** in a judgment in the following words.

> *The science of identification of footprints is no doubt a rudimentary science and not much reliance can be placed on the result of such identification. The track evidence, however, can be relied upon as a circumstance which, along with other circumstances, would point to the identity of the culprit . . . though by itself it would not be enough to carry conviction in the minds of the court.*

These epitaphs of the Apex Court became the case law for the lower courts. They take them as the final word on the evidence and ignore the evidence altogether. This is unfortunate.

The science of identification of track marks has advanced in recent years from a mere aid to a definite scientific proof. It is hoped that it will be given its rightful place in criminal investigations and trials in the coming future.

The following excerpts from the writings Forensic Scientists in the field not only illustrate the status the science as a definite scientific discipline but also indicate the vast possibilities of the evidence.

> *1. If there is found to be identity of fine details, such evidence is conclusive that the impression was made by the particular shoe examined. The chance that two soles should be stamped out in such a manner that there is exact agreement in pattern is so small that it is negligible.*
>
> *Peculiarities of wear which have been caused by some deformity of gait are also conclusive.*

1. *Pritam Singh v State of Punjab,* AIR 1956 SC 415 : 1956 Cr LJ 805 (SC).

Peculiarities of wear caused by defects such as cuts, holes, tears and so on, because they are adventitious, are quite conclusive.

Peculiarities of repairs are also conclusive…[2]

2. The importance of an impression (defined traces in the form of fingerprint, palm-print, footprint, tool mark or wearing apparel mark) as evidence lies in its uniqueness. A given impression can be produced by one finger only; a certain shoe-print will correspond to only one shoe; a jimmy mark will bear the unique characteristics of the jimmy. Naturally, this uniqueness is invaluable as evidence; it can be established, however, only if there are a sufficient number of characteristic marks discernible.[3]

3. Erring on the side of generosity (to the defendant), we should expect to find only one such pair of heels, if we were to examine ten billion pairs; or, again, the odds are ten billions to one against finding another pair of heels which will make prints to correspond to the prints found at the scene of the crime.[4]

4. Even as in the comparison of fingerprints, a portion of a heel print, if it has sufficient number of similarities may be identified definitely as having been made by a certain shoe.[5]

5. Footwear identification has advanced, in recent years, from a mere 'aid to investigation' to an accepted laboratory technique on a level with ballistics and fingerprint examinations. In the past two decades, court rulings have increasingly accepted footwear evidence as positive proof of presence, even in the most serious offences.[6]

6.2 NATURE

Track evidence is varied in nature; naked footmarks, footwear marks, paw marks, hoof marks, tyre marks, skid marks, drag line of a load, impression of a stick or pug marks of a beast are included in the track evidence. Individual marks and their collective patterns (gait patterns[7]) are both useful in the identification of individuals.

A mark may be a print or an impression. A mark having length and breadth without appreciable depth or height is a print. A mark with length, breadth and height or depth, having three dimensions, is an impression. The terms print and impression have been used indiscriminately in literature. We have used the term 'mark' to include both prints and impressions. Marks may be visible (patent) or invisible (latent).

Foot and footwear form impressions on pliable surfaces like soft clay, mud, snow, etc.. They are sometimes called plastic marks.

Objects smeared with powders and liquids leave prints on various surfaces. Thus, a toe, a foot or footwear smeared with dust, ink, oil or blood leaves a print. They also leave prints on oiled, waxed or dusty surfaces even without being smeared.

Principles and methods for the evaluation of all marks are alike, though some collection techniques differ for prints and impressions.

Track marks are divided into classes for the convenience of their study:

2. Nickolls, L C, *Scientific Investigation of Crime*, 1956, pp 148–49.
3. O'Hara, E C and Osterburg, J W, *Introduction to Criminalistics*, p 75.
4. O'Hara, E C and Osterburg, J W, *Introduction to Criminalistics*, p 676.
5. Jones, L V, *Scientific Investigation and Physical Evidence*, 1959, p 74.
6. Abbot, J R, *Footwear Evidence*, 1964, p 9.
7. The gait pattern has acquired tremendous importance in recent years. The gait pattern of a criminal, captured in a CCTV camera, is being utilised for his identification.

6.2.1 Naked Footmarks

Quite a large percentage of people in India, including majority of criminals in rural areas, usually move about barefooted. The naked footmarks are, therefore, found at and around the scene of occurrence, frequently.

Ordinarily, the footmarks in crime situations have evidence deficit, mainly for the following reasons:

1. The foot transfer incomplete mark to the registering surface.
2. The surface registering the mark is not congenial to register the mark.
3. The main identifying features in naked footmarks are the ridge details, the phalange marks and the crease marks. They do not leave their marks most of the time due to the structure of the foot and nature of the recipient surface.
4. The foot usually leaves gross marks from heel, toes and front part of the sole. They do not possess many identifying features. Often gross/incomplete shapes of the heel and toes are registered. They do not provide enough identifying evidence.
5. The Supreme Court verdict has killed the initiative of the IO to collect the evidence, unacceptable to the court. He collects the evidence callously and that also rarely.

It is against this background that the positive and definite identity of the footmark is not established in all cases, and the use of the evidence has not been exploited properly.

On the other hand, footwear marks are identified in respect of the footwear in most of the cases (~ 80 % cases). The belief of the judiciary, the bar and the investigating officer that the naked footmarks are more valuable than the footwear marks is, therefore, not correct. The forensic value of the footmark, if identified, is, of course, greater because it links the culprit directly with the crime. In case of footwear marks, it is necessary to establish that the culprit owned and wore the particular shoe at the material time as the footwear mark identifies the footwear and not the wearer. The latter must be established by other evidence. In this respect, the marks and the wear pattern on the insole and the uppers of a well-worn shoe can be quite helpful in many cases.

6.2.2 Footwear Marks

Footwear marks include the marks of shoes, sandals, chappals, socks and like. The footwear may be factory-made or hand-made. It may be made of leather, partly or wholly, rubber (natural or synthetic) or plastics. Cloth is used in canvas and other shoes.

In some parts of India, strings, from a variety of fibres, are also used to make shoes. A fairly large number of persons in India, especially in rural areas, wear handmade leather shoes. The number is decreasing fast. Rubber is being used increasingly for soles. The number of factory-made shoes is also increasing. Foreign brand shoes have also invaded the market.

Some religious persons wear wooden shoes. They are worn only for short distances, as they are not very comfortable for walking long distances. The advent of rubber and plastic shoes has reduced the number of wooden shoes and their bearer.

The soles and the uppers are joined together through stitches, nails or with adhesives. The uppers are made of leather, rubber, plastics or canvass. Stitching, nails or their combination were common previously. Now, adhesives and stitching are used increasingly.

The footwear evidence suffers from one great drawback. If the culprit is not apprehended soon after the crime and he continues to wear the shoes, the additional wear and tear will change the original surface pattern and may not allow definite inter-linkage of the shoes and

the of the marks. The time after which the marks become unidentifiable varies with the extent of use or misuse, nature of the sole material and the terrain in which it is used. In actual cases, it seldom happens, the shoes are recovered soon after the occurrence.

In one case, a footwear mark was correctly identified in respect of the shoes recovered after six months. The culprit used the pair of shoes only for the commission of crime. (CH)

It is advisable to get the footwear compared even when it is recovered after a considerable interval of time. The pattern may not have changed much.

6.2.3 Gait Pattern

The art of tracking culprits through gait pattern is an ancient art. Certain tracker families practised it in various parts of India. The trackers were/are known as *Khojis* or *Paggies*. The police forces had frequently utilised their services for tracking. Some of them joined police service. The art/science of tracking has declined since, mainly due to urbanisation, metalled roads and increasing use of vehicles.

The trackers were, mostly, uneducated persons. Yet they have developed a uncanny sense for appreciation of peculiarities, distances, angles and pressures in foot, footwear and allied marks. They follow the track of individuals, animals, drag marks or even stick marks for miles, ultimately guiding the police/search parties to the destination (houses or hiding places) of the person being followed from the left marks. Likewise, they could follow foot or hoof marks of the animals and locate the stolen or runaway animals.

Further, if they observed the gait pattern of an individual at the scene of occurrence or on routes of ingress or egress, they could identify the individual in identification parades, picking up the person from a number of persons of similar constitution by observing their gait patterns.

The trackers do not take any extensive measurements, nor do they take down any notes. They create the impression that they have an uncanny power to identify the culprits.

Gait pattern has been studied scientifically also. The individuality of the gait pattern is established from the following:

1. Direction line (DL)
2. Walk line (WL)
3. Foot line (FL)
4. Foot angle (FA)
5. Step angle (SA)
6. Step length (SL)
7. Step Width (SW)

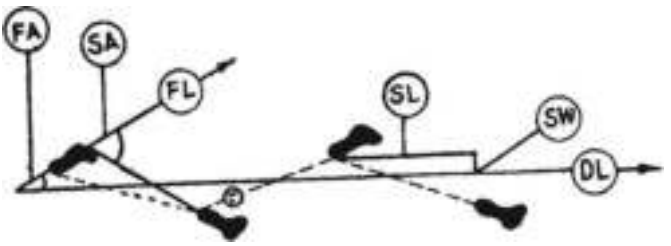

Fig. 6.2

Elements of a gait pattern at least four consecutive foot or footwear marks are essential to determine gait pattern.

In addition, the following characteristics are taken into consideration:

1. Dimensions of the mark
2. Peculiarities in the marks
3. Pressure points
4. Pressure defects
5. Missing or additional toes

There is evidence to believe that the trackers take most of the above factors into consideration to follow the track or to identify the individual in an identification parade.

It was not customary to study and evaluate gait pattern evidence by forensic science laboratories staff because it required at least four consecutive foot or footwear marks. They are available at the scene of occurrence only. The investigating officers were unable to gather the evidence collectively on the same format to permit gait pattern studies. It is possible now through video filming or photography of the evidence groups of four or more foot/footwear marks. Such consecutive photographs (or marks in video film), If sent to a laboratory, it would permit evaluation of gait pattern.

As the clarity of the individual marks is not so important in gait pattern studies, it is expected that gait pattern evidence can help in the identification of the individuals. The gait pattern will be useful where the individual foot or footwear marks do not carry sufficient individualising features; for example, in sandy places.

6.2.4 Footwear

Sometimes a culprit under tension may leave one fellow or a pair of footwear at the scene of occurrence. If only one fellow of the shoe is left at the scene and the other is recovered from the suspect, the matching of the two shoes provides strong evidence, linking the criminal with the scene. Likewise, the matching of the wear patterns of the pair left at the scene with a similarly worn-out shoes of the suspect often gives useful results.

> *In an interesting case, one fellow of the shoe was found at the scene of occurrence. It was suspected to be that of the murderer. The other fellow of the pair was recovered from a suspect's house. The shape, the construction, the patch and stitch work and the wear patterns inside and on the uppers proved useful to link the two fellows of the shoes. It was a Punjabi shoe where the two fellows of the pair are worn interchangeably. (CH)*

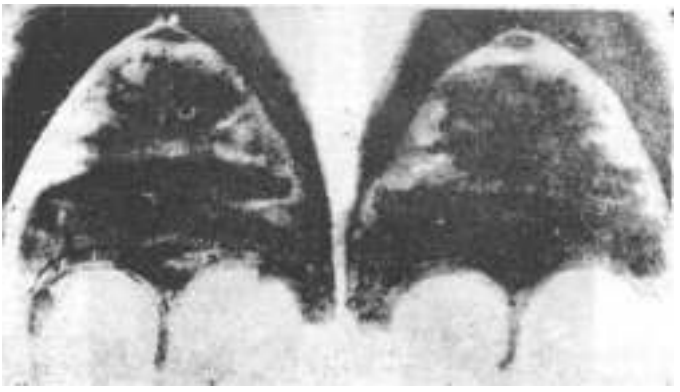

Fig. 6.3

Uppers show similar material, workmanship, wear and creases.

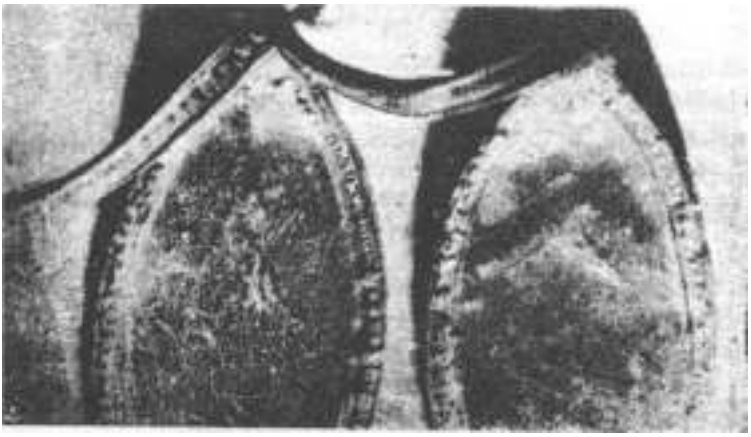

Fig. 6.4

Insoles carry evidence of similar material, craftmanship, wear and tear. the feet have not left identifiable prints.

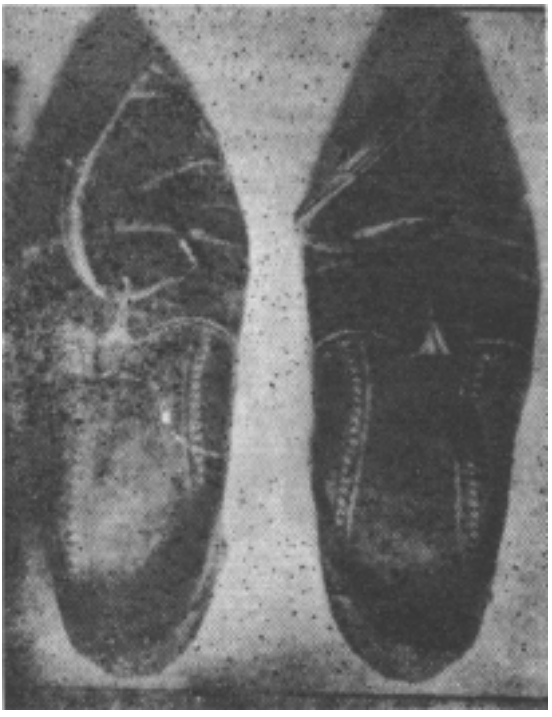

Fig. 6.5

The two fellows of the pair of shoes indicate complete similarity in material, manufacture, design and wear.

6.2.5 Extraneous Matter

Footwear also picks up dust, dirt, paint, glass and other materials from the terrain on which the wearer walks. The study of these traces proves useful in cases where the places visited have characteristic soil or dust. For example, the shoe will pick up the flour in a flour mill, coal from a colliery, dye from a dye factory, and fibres from a cloth mill and so on. Even the soils from different places give significant variations when chemically analysed.

The extraneous traces picked up by the footwear vary tremendously with the places of visit. They also vary with the structure and the structural material (especially of the sole) of the footwear. In a survey, all types of shoes were examined for traces they carried. The very common types of traces (gums, hairs, fibres, and paper pieces) were excluded from the survey. It was found that 60% of the shoes carried traces and about 40% shoes of all categories did not carry the traces. The following traces were observed:

Table 6.1

Material	Percentage
Glass	37
Gravel/sand	34
Metal fragments	12
Plant materials	10
Soil/plant residue	5

Residues are the deposits, which the wearer of the footwear or the naked foot leaves at places he visited. These deposits may be dust or dirt, residues of grease, blood or of any other fluid or solid substance picked up by the foot or footwear and deposited at the site. They are processed as given below:

- The marks are photographed.
- If the marks are on portable object, the object is taken to the laboratory.
- If the object bearing the mark(s) cannot be carried to the laboratory, the mark is lift after photography.

6.3 PROBLEMS/POSSIBILITIES

The evaluation of track evidence provides answers to the following questions:

1. Have the footmarks come from the feet of the accused/suspect?
2. Did the shoes of the accused/suspect leave the footwear marks at the scene?
3. Was the person who left track marks, running, walking or standing?
4. Is the footwear (recovered from the scene) of the accused/suspect?
5. Have the extraneous traces found on the footwear of the suspect/accused come from the crime scene terrain?
6. Which species of the animal has left the hoof/paw/pug marks?
7. Did the suspected animal leave the given hoof/pug/paw marks?
8. What type of vehicle left the given tyre marks at the scene?

9. Did the suspect vehicle/tyres leave the given tyre marks?
10. What was the speed of the vehicle at which the vehicle created the given skid marks?
11. Can we link the tyre rubber residues, left in the skid marks or at the given scene or to the given tyre(s)?
12. How long will the shoes, after the crime, continue to give comparable marks?
13. Can we give the age of the lifted impressions?

6.4 LOCATION

One expects to find track marks at all the scenes of occurrence. The investigating officer, therefore, should pay particular attention to locate them. His failure to find track evidence can be due to only one or more of the following reasons:

1. He arrived at the scene of occurrence too late. The traffic/ weather/public mutilated or destroyed the marks. The prompt arrival of the investigating officer (or his deputy) at the scene, therefore, cannot be over-emphasised.
2. He has not searched the scene thoroughly.
3. He has not been able to locate the culprit's arrival/departure routes correctly.
4. He has not been able to pinpoint the points of ingress/egress.
5. The culprits/ their well-wishers have destroyed the track marks.
6. The crime site terrain is uncongenial to register track marks.

The track marks are found at many places including:

1. The scene of occurrence,
2. On the routes of ingress or egress, and
3. At the places where the culprit has halted on the way to or from the scene for holding meeting with his colleagues, for distribution of the booty, for making a check of the haulage, for disposal of the incriminating or unwanted articles, to attend to the call of nature or to hide himself temporarily when interrupted.

The IO, on intelligent mental reconstruction of the crime, can identify these places. Track marks are found undisturbed at some such unsuspected places. He checks the following places thoroughly for the evidence.

6.4.1 The Scene

The scene of occurrence is the most important place for the track marks. The criminal stays and moves about there to commit the crime. However, they are often found intermingled with the marks of the victim, onlookers, visitors, friends and relatives of the victim. If the scene is not protected/preserved immediately, the original marks are mostly obliterated.

The search for the foot and footwear marks at the scene of occurrence should start from the focal point of the crime. For example, body of the victim is the focal point in a case of murder, a chest or an opened box is the focal point in a burglary case and so on. Search is extended to the entire scene systematically. Floors, furniture, showcases, cupboards, ventilators and windowsills are checked for both visible and latent prints.

If the culprit has visited a garage, he is likely to leave prints on the greasy surface of the garage floor.

The culprit may get his foot or footwear smeared in blood. He is, then, likely to leave prints in blood near the blood pool.

6.4.2 The Routes

The track marks found on the routes, followed by the culprit are often not disturbed by the curiosity hunters. The routes, therefore, is searched thoroughly after fixing the likely places where the disturbance is the least.

The garden of the house where an occurrence takes place is searched carefully. Some soft flowerbeds may have been trampled. If the culprit hid in a bush or other thick growth, the places are checked thoroughly for foot and footwear marks. In addition, the culprit may hide incriminating articles like knives, swords, firearms, clothes and the like. The hiding place is usually secluded and, therefore, the foot and footwear marks found at such a place may be found in good condition.

The entrance point: a door, a window, a ventilator or a roof is examined. If the place is covered with dust or is polished, the place is likely to bear foot or footwear marks of the culprit.

Dust deposited on window and ventilator sills usually retains the foot or footwear marks for a considerable time.

6.4.3 Conference Site

If the place of assembly or conference (usually a secluded place in a rural area) is located, it is searched for foot/footwear marks. The evidence discovered may indicate the number of culprits and their linkage through track marks.

6.4.4 Parking Place

If a vehicle is used, it should be ascertained where it was parked when the crime was committed. The place bears tyre marks, oil or grease drops, dislodged materials etc. The vehicle often carries dust, dirt etc. from other places. It may drop some of it at the spot, which may link the vehicle with the spot.

The place where the vehicle has been reversed, sometimes, carries clear track marks from all the tyres, which also prove useful to link the vehicle with the crime.

Location of surface prints on polished or greasy surfaces is often difficult and cumbersome. They are best located in the dark (at night, if necessary) using oblique light. A strong torchlight proves adequate in most of the cases. If the presence of print is suspected, the place is protected during the day, and the print is photographed at night.

New imaging techniques have facilitated the task.[8]

The track marks on routes followed by a culprit are located through trackers and police dogs.

6.5 COLLECTION

The collection of track marks is an important task in criminal investigation. Investigating officers are specially trained in various collection techniques. Training is fortified with practice (experience) which most of the IOs lack. The result is that the lifts are usually of poor quality and do not permit definite identification. Sometimes, the terrain of the site is such that it does not register the mark adequately.

8. See chapter 27 on Digital Image Forensics.

6.5.1 Materials Required

An investigating officer requires the following materials while collecting track marks:

1. **A good digital camera**

   If police photographer is accompanying IO, with his equipment, the investigating officer need not carry a camera.

2. **De-sensitized bromide paper**

   Both black (exposed) and white (un-exposed) dried bromide paper is required. They are softened at the scene of occurrence by immersion in hot water for a few minutes. Or, fifteen centimetres wide transparent adhesive tape and some thick transparent plastic sheets are used instead. The latter are replacing the bromide papers now. They are convenient.

3. **Plaster of Paris**

   About one kilogram plaster of Paris is required for one impression.

4. **Aluminium flexible strip**

   An aluminium strip, about one metre long and 3 cm wide is required to make retaining wall.

5. Shellac solution, mineral oil and talcum powder.

6. Miscellaneous other materials needed are wax, resins, plastic powders, modelling clay, sulphur, lead, woods' metal, plasticine, rubber bowl, spoon, sieve, wire gauze strips and flit pump (sprayer).

Plaster of Paris is the most frequently utilised material to prepare casts of impressions of feet, shoes and tyres. It is easily miscible with water to give a fluid of uniform consistency. It starts solidifying after about fifteen minutes and is set after about two hours. The casts can be lifted safely, thereafter.

6.5.2 Collection Techniques

The following collection techniques are common:

1. Tracing

It is the crudest but the easiest way to record a track mark. A glass (or preferably a plastic sheet) is held over the mark, and the outline of the mark is traced on the sheet. The details of the mark, such as wear and tear patterns, repair work, nails and stitches are indicated at the appropriate places in the sketch. In the case of naked footmarks, the shape of the toes, the inner and outer margins, the phalange and crease marks are drawn at appropriate places.

The value of a traced mark depends upon the artistic and observation skills of the investigating officer. It is highly subjective. Consequently, the technique is not valued. In fact, it is not used now. Modern photography, digital imaging, lifting and casting have made the tracing technique obsolete.

6.5.3 Photography

The track marks are photographed in all cases. While taking photographs one should:

1. Keep the lens of the camera parallel to the surface on which the mark is found. It should be just above the mark, at a height that gives clear and sharp image and fill the screen. The camera on a tripod gives better results.

2. Arrange the aperture of the diaphragm in such a way as to get ample depth of field to cover points at various levels in the impression. For this purpose, a sharp focus of an intermediate point with fully opened aperture is obtained and the aperture is suitably closed.
3. Place an identification chit (containing case number with date, police station, district and initials of the photographer) along with a scale.
4. Select a suitable format of the film to get a clear photograph of the marks. A format of 4″ × 5″ was considered to be the best in olden days, 35 mm camera ruled the roost till recently, now DSLR (Digital Single Lens Reflex) camera of high resolution are replacing the film camera/photography.
5. Take four photographs of the same mark; two with lighting from both sides at angle 45° and two with single oblique lighting from either side, to ensure capture/recording the finer details.
6. Photograph the surface prints at night, as they are difficult to photograph during daytime. A flood light is thrown obliquely from different positions and the marks are photographed.
7. Take the mark bearing object to the laboratory whenever possible. It is easy to photograph the prints under artificial light.
8. Requisition the services of a professional Forensic photographer (a laboratory or a police photographer) to photograph the marks in difficult situations.
9. Choose a high quality/high pixel DSLR camera. These cameras offer many advantages[9]:
    - The quality of the recorded image can be checked there and then. The unsatisfactory images are eliminated and replaced with new images.
    - The processing is highly convenient; no studio work and ample possibilities of manipulation (enlargements, contrast control, brightness and colour management, segmentation, trimming, etc.)
    - It is time and cost effective.

The three-dimensional photography should be more useful in sunken impressions. It is not used extensively, because of cumbersome presentation of the photographs in courts.

6.5.4 Lifting

Marks are lifted only after they have been photographed.

Lifting, ordinarily, disturbs/mutilates the original mark. Lifting, therefore, is a **'now or never'** process. It brooks no negligence or incompetence.

In some cases, it may be possible to pick up a second lift, but the quality of the print is often poor and may not provide adequate evidence for comparison.

The lifting techniques vary with different surfaces and materials. The following ones are common:

1. A bromide photographic paper sheet is taken. It is desensitized by fixing it. After removing the excess water, it is placed over the print and pressed uniformly. The particles of the print are attached to the gelatin surface, and outline of the print is obtained on the paper.

9. See chapter 27 on Digital Image Forensics.

If the print is found in white (or light shade) powder, an exposed bromide paper is developed and fixed. The sheet thus obtained will be dark in colour. It provides a necessary contrast to the lifted print.

2. If adhesive tape of sufficient dimensions is available for lifting foot or shoe prints, it is used to lift the marks as in fingerprints developed by powders.
3. The thin layer of dust usually registers the track marks more clearly than most of the other media. But the marks are easily overlooked and equally easily destroyed. One has to take proper care in locating, preserving and collecting them. Cellulose acetate solution is sprayed over the impression in such a way that the nozzle of the sprayer is pointed upward and the solution falls on the impression by the gravity alone. Thus, the spray stream does not disturb the impression. Sufficient solution is sprayed to form a firm thick film. After evaporation of the solvent, the film is peeled off. It carries the mark in the dust.
4. Greasy and sticky marks and marks made by shoes smeared in blood or liquids on any surface are lifted by first dusting the marks with a powder and then lifting the dust prints after removing the excess powder by blowing off the excess powder in the usual way.
5. The lifting of the prints in liquids or dried liquids is difficult and requires pre-treatment of the surface. Sometimes it is not possible to lift worthwhile prints from the same. Photography alone is used in such situations.

The investigating officers usually lift the track marks. A specialist in the field helps them in important cases. We have in India some specially trained officers posted in some districts. The specialists are also available in the training institutions of the police forces and forensic science laboratories.

The lifts are protected with transparent sheets of celluloid or glass for their study and presentation in the courts.

6.5.5 Casts

The casting process is a method of choice in 3-dimensional marks (impressions) especially when the mark has appreciable depth. Such marks are common in mud, snow and sand, etc. Proper casting process picks up the details of the marks efficiently. Photography may not pick up all the minute details in some situations.

Casting spoils the impression almost completely. It is, therefore, necessary that the impression is photographed before preparing a cast of the same.

A variety of materials: plaster of Paris, wax, resins, plastic powders, modelling clay, sulphur, lead, woods' metal, plasticine and the like, are used to prepare casts. Plaster of Paris is, however, the most frequently used material.

In the preparation of casts, one should:

1. Remove extraneous matter (such as, grass, twigs, stone, etc.) from the impression, provided the removal does not disturb or mutilate the impression. If there is even minimal danger for mark disturbance, the matter in not removed.
2. Spray shellac solution (shellac dissolved in spirit) over the impression. The nozzle of the sprayer is kept close to the impression and pointed upward, thus, the solution falls upon the impression by gravity. The air or solution does not disturb the impression. Spray sufficient solution to get a 'skin' of shellac over the impression.

3. Spray mineral oil over the shellac layer. Mineral oil permits easy separation of the shellac layer from the casting material. Sewing machine oil serves the purpose admirably.

   Note.—Steps (2) and (3) are required only when the impression is in soft dust or sand that are likely to be disturbed and altered by the ingoing Plaster of Paris solution.

4. Place an aluminium strip frame (about three centimetres in width) around the impression as close to the impression as practicable to avoid wastage of plaster of Paris. The frame acts as retaining wall for the solution.
5. Pour plaster of Paris solution[10] in the impression at an unimportant place *(e.g.,* instep) to avoid damage, due to pouring or flow, to the marks in the impression. It is allowed to flow slowly until it fills the impression and acquires a thickness of about one centimetre.
6. Reinforce the cast at this stage by putting wire gauze pieces, length and breadth wise. If wire gauze pieces are not available, soaked wooden or sack cloth pieces are placed instead.
7. Pour more Plaster of Paris solution until it acquires a thickness of about two cm.
8. Allow the cast to set for about ten minutes. The details of the case: case number with date, police station and date of lifting, signatures of the investigating officer and witnesses are then engraved on the mould.
9. Allow the cast to set for another ten to fifteen minutes. It is set hard by this time and can be lifted.
10. Remove adhering earth from the impression bearing area by washing the cast under a gentle stream of tap water, with palm. Do not pull out embedded debris.

    A Soft brush is used to remove the dirt.

11. The cast dries up, for transportation in about two days in dry weather.

The technique is modified under special circumstances.

6.5.6 Impression in Mud

Remove as much water as possible by siphoning off the water with a rubber or plastic hose without disturbing the impression. Spray powder of Plaster of Paris over the impression till a thickness of about two centimetres is reached and the cast is allowed to set for about fifteen minutes before removal. Use plaster of Paris solution if the impression does not contain sufficient water.

---

10. Plaster of Paris solution is prepared at the scene and used immediately before it starts setting.
    The solution is usually prepared in a rubber bowl. The bowl is filled to two-third level with water and plaster of Paris is sprinkled in it with a sieve. The plaster tends to remain dry on the surface when the solution becomes saturated. Sprinkling is stopped. The solution is mixed thoroughly with hands to remove any air bubbles, clumps or gritty matter. The solution, when ready, is of the consistency of cream.
    High quality plaster of Paris is used to get worthwhile casts, as there is only one chance for casting the impression. Usually, plaster of Paris used by the dentist is used.
    Addition of common salt increases the setting speed. Dilute acetic acid (vinegar) retards the setting.

6.5.7 Impressions in Snow

For an impression in snow, one should:

1. Spray ice-cold talcum powder with an atomizer on the impression.
2. Spray ice-cold shellac solution over the powder and pour ice-cold plaster of Paris solution in the impression.
3. Remove when set.

OR

1. Sieve in ice-cold plaster of Paris to form a thin layer over the impression.
2. Pour in ice-cold solution of plaster of Paris.
3. Remove when set.

In the last method, the marks bearing surface is brittle and needs careful handling.

Pour molten sulphur in the impression in the snow. Molten sulphur forms a thin layer on coming in contact with ice or snow. The immediately formed layer provides heat insulation for sufficient time, and sulphur picks up the details of the impression on cooling.

6.5.8 Specimens

It is always better to compare the track marks with the original source creating the marks. Thus, in footwear, tyre or socks marks the suspected sources are seized, packed, sealed and sent to the laboratory for comparison.

For the comparison of the naked-foot or the hoof marks, specimen impressions have to be prepared. A piece of land is thoroughly prepared. The suspect is made to walk on the piece of the land to create a number of impressions. The best impression for each foot is selected. The cast is prepared in the usual way.

The specimen impressions should be sunken or shallow corresponding to the crime impressions.

The specimen surface prints are obtained on paper by inking the foot of the suspect with fingerprint ink and pressing the foot over a paper.

If an adhesive tape of sufficient width is available, it is used to take the print. The foot is smeared with appropriate fingerprint powder, pressed on the adhesive tape to register the footmark. The tape is pasted on a transparent plastic sheet to protect the print. Alternatively, the lifted impression is protected by covering the print with a fresh length of the tape. Superimposition of the prints permit direct comparisons.

Three specimens with varying degree of smearing are obtained for comparison purposes.

6.6 INNOVATIVE TECHNIQUES

6.6.1 Holography

A British scientist, Dr Bradford has promoted a laser technique for recording foot or shoe prints on carpets, which are invisible and otherwise difficult to record.

The technique works because the fibres of a carpet are compressed by a shoe or foot when a person walks over it. The compressed fibres tend to resume their original positions.

Though visually the fibres do not appear to do so, in actual practice the fibres take quite a long time to come to their original positions. A laser beam is able to record this compression on a photographic plate. The outline of foot or footwear and the surface characteristics of the tread such, as patterns, nails, cleats, and wear and tear are recorded by the variations in the depressions on the carpet. The laser beam records the actual positions of the fibres at various intervals of time when they tend to come back to their original position after the compression. The technique is known as holography, and the photograph is known as a hologram.[11]

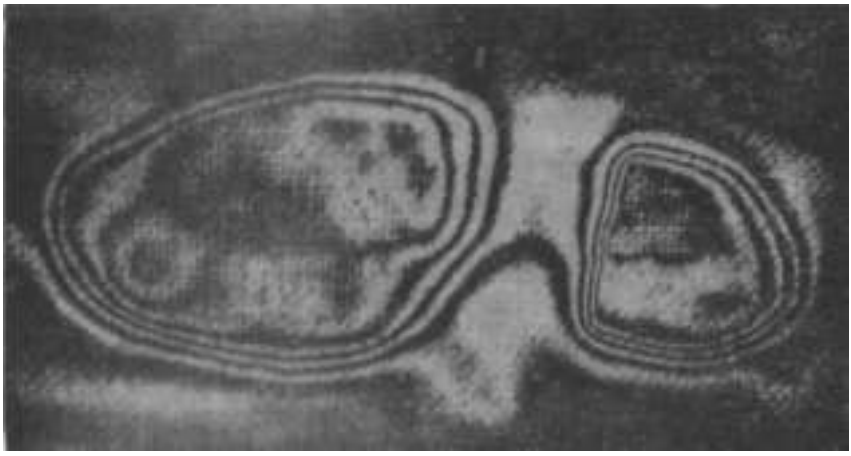

Fig. 6.6

A hologram obtained from a carpetted surface with the newly developed technique. holography.

The actual position of the fibres at a given interval can be a fair index to the time elapsed since the fibres were compressed. Thus, the rough age of the prints can also be estimated.

6.6.2 Electrostatic Technique

The National Police Academy, Tokyo, has evolved a new technique[12] for lifting invisible foot and footwear marks on floors or floor covering. It is based upon the principles that the dust particles can be lifted at high voltage on to a vinyl sheet, where they can be photographed or fixed on a gelatin paper.

The process involves the following steps:

1. Take a black vinyl sheet and cover the area suspected to bear foot or footwear marks.
2. Cover the sheet with an aluminium foil. Apply a high voltage of about 15,000 volts to the foil.
3. Photograph the mark formed on the vinyl sheet.

11. Bradford, W.R. 1976.
12. Kato Masao, 1973.

Larger sheets to cover the whole room or whole path can be used. Only equipment is a transformer which is a box measuring about 30 × 25 × 20 centimetres, weighing about 3 kilograms.

A culprit entered a house for theft. The owner got up and a fight ensued. The culprit, however, managed to escape after injuring the owner. With the electrostatic technique six clear prints were lifted.

Routine questioning, some days later, indicated one suspect to be the possible culprit. His shoes were checked. Comparison with the questioned prints established them as the source of origin. (CH)

Fig. 6.7

Dust prints through Electrostatic deplar

6.6.3 Periphography

Periphography is useful to record the whole tread of a tyre. The camera is called the periphery camera. The movements of the film and that of the tyre are so synchronized that a continuous photograph of the circular surface is obtained on a straight strip. The technique is also useful in firearm and fingerprints on curved surfaces.

6.6.4 Latent Prints Processing

Latent foot or footwear prints are processed like latent fingerprints. A good fingerprint powder, preferably magnetic powder, is sprinkled with a brush. Magna brush technique is preferable. The developed print is photographed and may also be lifted if found on an object, which cannot be moved to the laboratory. Otherwise, the object is taken into possession and sent to the laboratory.

Latent tyre prints are being collected by a new technique.[13] The latent print is exposed to ultraviolet rays. The prints fluoresce and give visible images. They are photographed.

13. Lloyd, J.B.F. 1976.

Fig. 6.8
Tyre Prints in UV light

6.6.5 Silicone Casts

Silicones are new plastic compounds.[14] They have the advantage that they do not adhere strongly to the materials with which they come in contact. Under proper conditions, they harden quickly. Consequently, they are useful to lift prints and shallow impressions from sloping and curved surfaces. Prints even from walls can be lifted by slowly spraying a solution of the silicone plastics.

6.7 EVALUATION

It is believed that every mark has an individuality[15], which cannot be duplicated even with the best of human skill and scientific techniques. The individuality in a given mark is established from the following features:

1. Dimensions
2. Shapes
3. Patterns
4. Peculiarities

14. Boyle, J. 1975.
15. It may not be possible in some cases to prove the individuality.

In all marks, general dimensions should correspond with the source creating the mark. If the dimensions of mark vary to an inexplicable extent, the suspected source could not have created the questioned mark. The foot and footwear marks have tremendous variations in dimensions and the differences permit quick elimination of certain suspected sources.

The dimensions of the casts vary due to nature and quality of the surface, shrinkage or expansion of foot, footwear, their marks and casting materials and especially how it was created (standing, walking or running). However, the variations in dimensions are within limits. Ordinarily, variations are less than 5%. They should not exceed 10% unless there are special conditions, which account for the extraordinary variations.

The shapes of the foot and footwear vary tremendously. The variations help both elimination and identification of the suspected sources.

The naked foot may be normal, flat, curved or one of the infinite variations in-between the main types. The same is true of toes. Similarly, the shape of footwear depends on the whim of the wearer and of the manufacturer. Pointed toes, flat toes, wide heel, narrow pencil heel and many intermediate variations are seen. The number of variations observed was really fantastic in India, mainly because we were using hand-made shoes, on order. Thousands of shoemakers daily made shoes to order according to the fancy of the customer.

Handmade footwear had/have an individuality of its own. Many factors contribute to create the unique shoes. In addition to design, materials, sizes, etc., the shoes differed in their stitch, nail and patch work patterns. This uniqueness of the shoe is also transferred to the marks they produce. It was/is, therefore, far easier to link the mark with the shoe in hand made shoes.

The naked foot bears papillary ridges patterns. They are not transferred in the incriminating marks at the scene as the registering surface in not congenial for the transfer. However, if the surface I polished, prints thereon may carry the ridge details. Fingerprint experts evaluate them.

The tyres manufacturers usually have their own different tyre surface (tread) patterns. The tread marks indicate the brand name of the tyres. The patterns help quick elimination/further comparison.

Peculiarities due to manufacturing defects, damage, and wear and tear are individualistic in nature. They permit linkage of tyre marks with the tyre.

6.7.1 Naked Footmarks

Many persons walk bare-footed in India. Naked footmarks are, therefore, found in the investigation of crime especially in rural areas.

The following characteristics of naked footmarks help to identify the person who left the foot mark:

Fig. 6.9

Typical naked footmark. ridge patterns, toe patterns, creases, worts' marks are visible.

1. Margins

In naked footmarks, the margins are characteristic, sometimes. The margins consist of the outline of the heel and the inner and the outer boundary lines of the foot. The heel may be oval or round; the outer margin may be straight, bulging outward or inward or it may be irregular. The inner margin may be inward or straight or it may be of intermediate shape. Some deformed feet may leave separate marks for heels and soles. The inner and outer margins are discontinuous in such cases.

2. Toe Marks

The shapes and the sizes of the toes vary greatly. If the toe marks are properly imprinted, they give characteristic identification features. Riding toes, long and short toes, missing toes, partially cut toes and damaged toes sometimes offer useful characteristics for identification. The presence of an extra toe, its size and position are often highly characteristic and may be sufficient by themselves for identification purposes.

3. Toe or Ball Line

The line formed by the toes at their junction with the sole is often characteristic. It may be straight, curved or bulging. It may have one, two or more humps. Alternatively, it may be irregular. Toe line (known as *zanjiri* among trackers in India) is a very useful, identification feature.

4. Phalange Marks

Phalange marks are created by the phalanges of the toes. Their presence, position, and sizes are useful for identifying features. They are found in the footmarks, frequently.

Fig. 6.10

Fig. 6.11

The toe pattern and crease marks establish the identity of the culprit.
Figure 6.10 Mould lifted from the scene. Figure 6.11 Test mark mould.

5. Crease Marks

They are found in the instep and the sole of a foot. Their presence, positions, sizes and shapes are characteristic and permit positive identification of the mark in most of the cases, whenever they are available.

Crease marks are not often imprinted in footmarks.

6. Pits, Cracks and Cut Marks

The soles of the feet of persons who habitually walk bare-footed, suffer damages to form pits, cracks or cuts. The entities leave their corresponding marks in the imprints. The damage is individualistic in nature and permits definite identification of the mark in respect of its source, thus linking the mark with the person.

Fig. 6.12

Fig. 6.13

The mould (Fig. 6.12) lifted from the scene and the chappal (Fig.6.13) recovered from the suspect, link the criminal with the scene.

6.7.2 Footwear Marks

The identification of a footwear mark is possible even when the same is incomplete because it carries a number of identifying features. The heel carries the maximum details. It is also impressed with force. Heel marks alone may identify the shoe sometimes.

The following footwear features help in the identification of footwear marks:

Fig. 6.14
Ample Wear and Tear Evidence

1. Wear Patterns

The wear and tear of a shoe depend upon the gait of the wearer, any foot or leg defect, injury, the extent of its use or misuse and the terrain on which it is used. It also depends upon the quality of the material of the sole and the craftsmanship of the shoemaker. No two persons have the same walking habits, nor do they walk on the same or similar terrain. It is also not possible to make two shoes exactly alike. Therefore, the wear patterns of each fellow of a pair of shoe (even of the interchangeable type) are expected to be different. Experience in the examination of hundreds of pairs of worn shoes has confirmed the same. The wear pattern of every fellow of a pair of shoes has always been found different.

The wear and tear or damage to the sole and heel, nails, stitches and patches form the mark pattern. It is characteristic and proves useful in positive/negative identification of the mark.

2. Repairs

If a sole of a shoe has been repaired, individuality is conferred on the shoe. The patches, the stitches and the nails used in the repair are never same in size and at the same position.

3. Craftsmanship

In handmade shoes, the craftsmanship is individualistic. The positions of the patches, nails and stitches and inter-distances are always different in different shoes.

It is not possible to produce two soles exactly alike. It is not possible to put stitches or nails in exactly the same positions even in a factory. In addition, sole materials will have some differences due to imperfect stamping and damage caused in the processes.

Thus, factory-made shoes also have individualities. However, the differences are sometimes so subtle (minute) that they are not registered or recorded in the marks, and thus, defy identification when the footwear etc. is new.

Fig. 6.15

Fig. 6.16

Stitch and nail patterns may alone individualise the sole of shoe (Fig. 6.16) and identify its prints (Fig 6.15) from the scene.

4. Damage

The damage to a shoe, like cuts and cracks or chipping the off portion of the sole (eaten by insects or lost due to chipping), also confers individuality on the sole.

5. Extraneous Traces

The extraneous matter like small stone pieces, glass chips, metal fragments, a nail, mud, paint or even cow-dung may be adhering to the sole, which may have come from the crime scene or the routes. If it leaves its corresponding outline in the mark of the shoe, it makes the identification easier and certain.

You have come up from the South West. Yes, from Horsham. That clay and chalk mixture which I see upon your toe caps in quite distinctive.

Sherlock Holmes-1891 (The Five Oranges)

6.7.3 Hoof Marks

The individualisation of hoof marks is difficult. Often the nature of the animal alone can be given. Sometimes damage to the hoof or wear and tear of the iron-shoes of a shod animal may permit individual identification of the animal.

6.7.4 Paw Marks

The paw marks sometimes contain crease and crack marks. They permit positive identification if the animal or its specimen marks are available.

The nature of the marks may indicate the type of beast.

6.7.5 Tyre Marks

It is often possible to give the possible make and model of a tyre mark from the pattern but positive identification needs, in addition to corresponding patterns, additional evidence of the type:

1. wear and tear;
2. damage;
3. presence of sticking foreign matter; and
4. repairs, if any.

Imitation of patterns in retreading prevents definite identification of the make/model of the tyres from tread patterns.

6.7.6 Gait Pattern

Gait pattern is walking (body movement) pattern of an individual. Its identifying features as already seen are the direction line, the walk line, the foot line, the foot angle, the step angle, the step length, and the step width. These and some other features of the foot or footwear link the walker with the gait pattern.

The gait pattern also indicates whether a person was walking, running or standing.

A running man exerts about two to three times the pressure he exerts while walking. Therefore, the shapes and sizes of the marks and the step lengths vary. The step length in a

slow walk is about 60 centimetres, while it increases to about 90 centimetres in running. It also varies from man to man according to his height and habits.

A standing man gives clear mark of his foot or footwear. There are drag or slippage marks if he is walking or running. If an individual has stood for sometime at a particular place, the marks at the spot are found somewhat mutilated.

Gait pattern studies have acquired tremendous importance in recent years; because they are used in Forensic Biometric identifications of the criminal through CCTV camera footage. These surveillance cameras cover the important sites or likely places for the depredation/visits of the criminals. They record the movement/action of the criminals. The criminals usually cover their faces and thus prevent their identification from the facial features. However, they do not bother about their gait pattern. In some countries, CCTV recorded gait pattern is used to identify the criminal. In India, we have yet to pick up gait pattern technology. Many surveillance cameras have been set in many places. They record the gait pattern images but the record is not studied/compared with the gait patterns of the suspects.

The sensors in computer extract/compare the data/sequence of the patterns from the images taken by the surveillance cameras.

> **Shakespeare: The Tempest**

6.8 IDENTIFICATION TECHNIQUES

Questioned track marks are identified by comparing them with the standard marks, obtained from the suspected sources. The methods of comparisons are:

6.8.1 Measurements

The dimensions of the questioned mark and that of the source or its specimen are compared. The inter-distances between characteristic points are noted and compared. Comparison is facilitated by the use of a divider of a large size.

6.8.2 Side by Side Comparison

The comparison of the positions and dimensions of identifying features is sometimes carried out with the help of photographs. Slightly reduced photographs (reduced to the same scale) are pasted side by side and a large glass or plastic sheet ruled into small squares is placed over the photographs. The identity or non-identity of the common source becomes apparent at once.

The changeover from three-dimensional evidence (footwear and impressions on moulds) to two-dimensional evidence (photographs) always incurs some loss of clarity.

6.8.3 Photographic Superimposition

A normal print of the crime exhibit and transparency of the corresponding text exhibit are prepared either to the original size or reduced or enlarged to the same scale. The transparency is superimposed over the photograph. The identity or non-identity of the common source is quickly established.

6.8.4 Adhesive Tape Superimposition

In this technique, the footwear is evenly smeared with fingerprint powder. Aluminium powder is preferable. Excess powder is tapped off. The footwear is placed on an adhesive tape of sufficient dimensions, capable to record the complete mark. The print thus obtained is covered with a plastic sheet. By placing it over the questioned mark, identity or non-identity of the suspected source is established and demonstrated easily.

It obviates the necessity of preparing photographs for court purposes.

The technique is not being used to any appreciable extent so far. However, it may become popular because it is convenient and superior to other techniques.

6.8.5 Composite Match

If the pattern is sufficiently characteristic, a composite match may be useful for demonstration purposes. A composite photograph is prepared in the usual way.

6.8.6 Pressure Pattern Evaluation

The foot surface is uneven. Its various parts, consequently, exert varied pressure on the surface with which it comes in contact. The different pressures create varied wear marks on the shoe materials, which get sandwiched in between the foot and the surface on which the foot is placed.

The pressure variations create contours. These contours are specific to the pressure patterns. It has been possible to capture these patterns through special equipment known as Pdbarograph (PBG). Two types of machines, one for static and one for the dynamic track marks have been developed. The preliminary investigations show encouraging results.

The footwear is worn for a considerable time also marks the insoles and the inside of the uppers. These marks have specific shape and dimensions depending upon the foot and the walking habits/peculiarities of the walker. They help to identify the footwear and the wearer.

6.8.7 Skid Marks[16]

When brakes are applied suddenly to stop a speeding vehicle skid marks are formed at the site. The brakes stop the revolution of the tyres, but due to inertia, the vehicle continues to 'skid' on the road until the friction overcomes the momentum. The distance of the drag or skidding is the length of the skid mark.

The length of the skid marks depends upon:

1. the speed of the vehicle,
2. total weight of the vehicle,
3. the condition of its tyres,
4. nature of the road surface, and
5. atmospheric conditions: rain/wetness reduce the friction. It increases the skid length.

Skid marks are often observed in motor vehicle accidents. The marks give an idea about the type of vehicle involved and its speed in hit and run cases.

The speed of the involved vehicles is calculated from the lengths of skid marks.

The absence of skid marks in an accident indicates either failure of the brakes or failure of the driver (drunk or drowsy).

16. Skid marks have been discussed in some details in chapter 16 on Motor Vehicles.

6.9 PRESENTATION

The track evidence is presented in the form of a report. The report is acceptable under section 293 of the Code of Criminal Procedure. An acceptable report contains detailed reasons in support of the opinion. It is illustrated, whenever necessary.

The track evidence is illustrated through photographs of the test exhibits (specimen prints, casts or original objects) and of the crime exhibits (casts or lifted prints). The photographs are pasted side by side on a chart. Prominent characteristic features used for the identification of the marks are shown by drawing lines and giving corresponding numbers in the two photographs. Notes on the margin explain the points of similarities. The expert signs the chart.

If the expert gives evidence in person, He produces illustration charts along with the report. The chart illustrates the points of similarities for the convenience of the court. His bases for identification are the direct examination/comparison and study of the various features on the crime and test exhibits.

It is convenient to produce photographs of about two-third of the actual size. Reduction in size increases the clarity of the points, in many a case.

If only a portion of the evidence is to be illustrated, enlarged photographs are produced/ presented.

Our experience indicates that the photographs in track evidence are always inferior to the original three-dimensional evidence. The photographs, though taken under ideal conditions, will miss some minutiae. It is, therefore, advisable to study the three-dimensional evidence, when photographs are not fully convincing. It consumes more time and requires handling of dirty exhibits, but such considerations are immaterial in cases where lives and liberties of persons are involved.

The use of adhesive tape prints in the courts should have excellent demonstrative value. The superimposition of the print over the cast should convince most of the viewers.

6.10 ACCEPTABILITY

6.10.1 Law and the Science

Formerly it was argued whether the track marks identification is a science and whether it is covered under section 45 of the Indian Evidence Act or not. The High Courts held different views on the subject and caused confusion. A ruling of the Supreme Court says that it is a science and is covered by section 45 of the Indian Evidence Act, has finally settled the issue.

6.10.2 Law and the Specimens

The second legal conflict was whether the police or the magistracy could order the taking of footmarks under Identification of Prisoners or not. Some courts held that it is against article 20(3) of the Constitution. The **Supreme Court verdict**[17] finally decided the matter that the taking of specimen footmarks is lawful.

6.10.3 Recognition of the Expertise

The track marks are one of the most frequently occurring evidence, though not utilised frequently. Unfortunately, Indian courts have not been given proper recognition to the track evidence. The Supreme Court has dubbed the science rudimentary. As the lower court has to

17. *State of Bombay v Kathi Kalu Oghad,* AIR 1961 SC 1808 : (1962) 3 SCR 10 : (1961) 2 Cr LJ 856 (SC).

follow the verdict, the lower courts do not place much reliance upon the evidence. In fact, some of the lower courts refuse to consider it at all. Thus, an important forensic identification aid to identify/link the criminal is lost. The criminal justice system suffers.

The misunderstanding about the track evidence is due to a number of causes. It is hoped that reappraisal of the evidence would give it its due place.

The causes, which perhaps weighed against the evidence, are:

1. The footprint evidence is considered *at par* with tracking. The courts compare the evidence of a tracker and a footprint expert *inter se*. The two often do not come to the same conclusions. The courts conclude that the science is yet rudimentary.

   The courts fail to appreciate that the basis of the identification of the two experts are different. Whereas the tracker depends upon various elements of gait pattern, the other depends upon the individualizing features of the single mark. The latter may or may not carry sufficient evidence for definite identification.

2. The foot carries papillary ridges. The courts feel that like fingerprints, the identification of the footprints should be based upon papillary ridge details. Yet the identification is not based upon them in footprint identifications, contrary to their expectations! They, therefore, conclude that the science is yet in the developing stage.

   The earth, sand, mud and surfaces on which the marks are left are uncongenial to register the fine ridge details. They register only gross outlines which the expert observes/evaluates. He makes definite identifications only if he finds some deformity, crease marks, pits, cracks or wound marks. But these features are not found in all cases.

   The argument is carried further, of course, erroneously. It is felt that if the footmarks are not identified positively (where ridge patterns are expected) the footwear marks should have even lesser chances of identification, as they do not carry any ridge details.

   The basis of the misconception is the comparison of footmark with fingerprints on one hand and comparison of footmarks with footwear marks on the other hand. The comparison of footwear and other tread evidence should be, in fact, with tool marks and firearm identification work.

   The identification of a footwear mark in respect of its source is as certain as the identification of a fingerprint or fired cartridge or bullet provided the collected mark is clear and carries sufficient details.

   The wearer of a pair of shoes is not identified from these marks. If a second person puts on the footwear and creates a mark, the new mark will not be materially/forensically different from the first mark. It is like firearm evidence where the firearm is identified from the fired bullet or cartridge and not the person who fired the shot. Possession of the footwear at the material time, therefore, must be established, as in the case of firearms.

3. The track marks are, ordinarily, found in earth, sand, clay and mud. The surface may have stone pieces, twigs, grass and other matter on the surface. The extraneous matter obstructs the registering of the marks.

   - *First*, it covers the mark-bearing surface partly.
   - *Second*, the extraneous matter leaves its own imprint in the mark. These omissions and additions often confuse the nonprofessional.

4. The recording processes (lifting, casting, sketching or photography) are never perfect. Some loss of details the features always occur. It confuses the non-professional.

EVIDENCE CHART

Laboratory Requirements:

1. Unmutilated and uncontaminated clues
2. Adequate samples: shoes and tyres, footmarks, hoof marks, trace materials
3. Visit to the scene of occurrence
4. Photogrammetric or 3-dimensional photographs, accurate sketches, intelligible descriptions.

Evidence	Location	Collection	Identification	Sample	Possibilities
1	2	3	4	5	6
Latent prints of foot and footwear	Polished floors, furniture, carpets, bed-sheets, table-cloth, window-sills roofs, garages, bathrooms, lawns	1. Photograph, (with oblique lighting) 2. Lift with adhesive tape, bromide paper 3. Take electrostatic prints (from hard smooth surfaces) 4. Take holograms (from carpets, grass)	1. Introduce identification data (FIR data, initials) through chit on photographs 2. Record location by photography, sketches and description	Footprints or foot wear of the suspect, Tyres of the suspected vehicles	1. Linkage 2. Description of the suspect 3. Make of the footwear 4. Mode of walking 5. Possible make of the tyres
Visible prints of naked foot, footwears, tyres, hoofs, paws	1. Scene: floors furniture, roads, hard surfaces, window sills, roofs, garages, bathrooms 2. Entrance, exit, route, conference site, disposal site, etc.	1. Photograph 2. Lift	1. Introduce identification data (FIR data, initials) through chit on photograph 2. Record location by photography, sketches and description	Footprints or footwear of the suspected source	1. Linkage 2. Description of the suspect 3. Make of the footwear 4. Mode of walking

Evidence	Location	Collection	Identification	Sample	Possibilities
1	2	3	4	5	6
Impressions of naked foot, foot wear, tyres, hoofs, paws	Gardens, fields, roads, beds and shores of pools, rivers, lakes, seas, dung heap, dust heap	1. Photograph 2. Cast	1. Put identification data chit in the photograph 2. Scratch identification marks on the back of the cast	1. Original footwear or tyres 2. Prints of feet, hoofs, paws, similarly prepared	1. Linkage 2. Description of the suspect 3. Make of the footwear 4. Mode of walking
Latent prints of tyres	Garages, parking places, paper or plastic sheet on which the tyre rested	1. Photograph with ultra-violet rays 2. Intensification by polyvinyl acetate solution: spray, if necessary	Identification data chit in the photograph	The suspected tyres	1. Make and model of tyres 2. Identification of tyres 3. Identification of vehicle through tread and traces of tyres
Skid marks	Roads	1. Photograph 2. Measure 3. Sketch 4. Collect tyre traces	1. Put data chit in the photograph 2. Write identification data on the sketch paper	1. Get similar skid data, photograph under controlled conditions from the same vehicle at the same site	1. Speed of the vehicle 2. Identification of the vehicle through tread and traces 3. Reconstruction
Gait patterns	Scene: floor, carpets, lawns, garden, field, routes, hiding places	1. Photograph 2. Take photogrammetric photographs 3. Lift	1. Put data chit in photograph 2. Scratch data on lifts	1. Get gait pattern from suspect 2. Collect clear foot marks or footwear	1. Identification of source, sex, age, deformity, mental state, individuality, etc.

Evidence	Location	Collection	Identification	Sample	Possibilities
1	2	3	4	5	6
					2. Gait: running, walking, standing 3. Number of persons 4. Reconstruction: movement, halt, haulage etc.
Footwear	1. Scene 2. Routes 3. Disposal site 4. House or hide-out of the suspect	1. Photograph the location with data chit 2. Collect lose clues, stains 3. Scratch identi-fication data 4. Get signatures of witnesses 5. Seal and send it to laboratory from the site of recovery	1. Scratch identification data, initial 2. Get signatures of recovery witnesses	1. Second fellow of the pair 2. Similarly worn similar footwear of the suspect 3. Prints of the naked feet of the suspected wearer	1. Identification of fellow of shoe 2. Identification of the wearer 3. Reconstruction 4. Identification of marks 5. Identification of a mutilated corpse
Tyres	Vehicles, disposal site, scene	1. Record the position of the tyres (sketch, photograph writing) 2. Protect the evi-dence-bearing site 3. Pack, seal, despatch (from the scene)	1. Scratch identi-fication data 2. Get signatures of recovery witnesses	1. Tyre patterns 2. Manufacturer's catalogue 3. Corresponding tyre samples	1. Identification of make, model, crime scene marks, fluorescent traces, vehicle 2. Skid marks evaluations 3. Reconstructions

6.12 CASE LAW

6.12.1 Footprint evidence Admissible[18]

Both the courts below believed the testimony of P.W. 3, as they could find no cogent reason for discrediting it, which was described as disinterested. The High Court relied on:

1. Motive of the accused persons to commit the crime;
2. The accused having been seen along with a stranger on Thursday, the 6th Agrahavan 1369. B.S. by Kazi Noor Mohammad (P.W. 3) while coming out of Batu's house with bloodstained clothes and a cycle which was being dragged by Majnu Mia as its rear wheel was chained and locked;
3. The embarrassment of the accused on being seen by P.W. 3 and the false explanation given by them about the existence of bloodstains on their clothes;
4. The fact that the cycle was taken by Maddassar on the day of the occurrence at about 4 p.m. to the cycle repairer, Bijoy Chakravarti whose shop is close to Majnu's house and that lock of the cycle was got broken at that shop;
5. Recovery of the broken lock from Bijoy's shop pursuant to the information given by Maddassar;
6. The recovery of the cycle from Maddassar;
7. False explanation by Maddassar that the cycle had been given to him by Batu's mother;
8. The existence of stains of human blood on the howai shirt worn by Maddassar at the time when P.W. 3 saw him on the day of the alleged murder;
9. The presence of blood marks on Majnu's nail cuttings;
10. *The opinion of the footprint expert (P.W. 22B. Chakravarti attached to the Forensic Science Laboratory) that some of the footprints found near the dead body resembled those of Maddassar;*
11. The fact that in the afternoon of 6th Agrahayan 1369 B.S. after the accused had come out of Batu's house that house was found locked and on the lock being broken open after three days the dead body was found lying in decomposed condition.

For holding that the circumstantial evidence led to no other conclusion except that of the guilt of the accused.

6.12.2 Non-acceptability of Evidence[19]

1. The learned session's judge relied principally for the corroboration of P.W. 10's evidence on the evidence of P.W. 33, the footprint expert. In para 38 of his judgment, the learned judge stated:

18. *Golam Majibuddin v State of West Bengal*, 1972 Cr LJ 1342 (SC). See also *Bahal Singh v State of Haryana*, AIR 1976 SC 2032 : (1976) 3 SCC 564 : 1976 Cr LJ 1568.
19. *Re Paramban Mammadu*, 1951 Cr LJ 580 (Mad).

> ***So far as accused 1, 3 and 5 are concerned, their complicity is established, because their footprints were found at the scene.***

That is to say, assuming the guilt of accused 1, 3 and 5 because their footprints were found in the bungalow, accused 4, must have been guilty, too, because he was associated with men whose footprints had been proved to be that of the murderers.

> *The opinion of a footprint expert is not admissible, as evidence. If the court is to make any use at all of footprints, it must be satisfied from a comparison of the various footprints that they are those of the persons whom the expert says they are. The value of evidence with regard to footprints is obviously very much less trustworthy than evidence with regard to fingerprints.*

In a fairly good impression of a finger or even in an impression where only a portion of the finger is shown, there is wealth of detail available to the expert and to the court for comparison. One sees in a fingerprint number of ridges and sweat pores situated along them. In examining a fingerprint, therefore, one not merely compares the general configuration of the finger and all the lines on it, but one is able to study such minute details as the bifurcations and junctions of the ridges and the relative positions on those ridges of the sweat pores. With regard to footprints, on the other hand, it would seem from the evidence and from what we have been able to read from Dr. Hans Gross, book on Criminal Investigation that one can only compare with the general shape of footprints found with the shape of impressions taken from the feet of the persons suspected. Even in this limited comparison, one has not the same certainty as one would have in comparing fingerprints found as the shape of impressions vary considerably according to the circumstances under which they are made. Footprints made when a person is walking slowly or fast or running slowly or fast or jumping, all create differences, which are material. Moreover, a footprint taken after a person has walked a considerable distance, as was the case here when the murder was committed, is larger than a footprint taken when a person has been at rest, as was the case when footprints were taken from the various persons in the sub jail, including some of the accused and P.W. 10 at page 497 of John Adam's translation of the above book, the learned author says:

> ***One may then say with Massen and rightly, that the details of all the impressions of a bare foot are in each particular case so distinctive and so characteristic that it is always possible to differentiate them, one from another and recognise again the same impression. This is wholly true only when the impressions in question have been produced under identical conditions...***

He then goes on to say that the difficulty increases if the foot is turned or moved. At page 499 he points out the necessity for making a number of trials in order to ascertain the circumstances under which an impression was made. At page 510, the learned author says:

> *Another result flowing from these conclusions is that the deductions made are only relative; they can never be expressed by precited data and have only comparative value. It is impossible to give measurements of fixed sizes; for the numerous factors—the size, the weight, and the other corporal singularities of the individual walking, his burden, his gait and the variable nature of the soil differ in every case and may be combined in so many diverse ways that it is absolutely impossible to give precise indications on this matter.*

After discussing the matter further the author says, "If one has but one indistinct footprint and no clue there from, another must be searched for." The only other passage that need be set out is found at page 532:

> *Much prudence must here be exercised (in taking measurements) and nothing undertaken which shows no chance of success. On the one hand the foot itself varies considerably,* e.g., *it is much smaller in cold weather or after a long rest than during hot weather or after a long march; on the other hand it is difficult to measure in as much as it is not a regular body and must be measured differently according to the parts dealt with.*

If we bear all these facts in mind, then we are far from satisfied that the prosecution has proved that the foot impression seen by the police on M.Os. 17 and 18 and on the portico are the foot impressions of accused 1, 3 and 5.

6.12.3 Expert Testimony Value[20]

The learned judge dealt with the testimony of the expert, at some length. His conclusion was that the evidence of the expert came to nothing. He did not direct the jury on the legal value of the testimony of the footprints expert. Section 45, Indian Evidence Act, does not include footprints within its ambit as it does the finger impressions. Notwithstanding this omission, the evidence of footprint expert has been admitted with the qualification that there should be other evidence to bring home the charge to the accused. The rule on the point is that the opinion of the footprint expert would not by itself suffice to base a conviction on and the rule has been applied to testimony of other experts including experts on fingerprints.

Considering that footprints as such are not included in section 45, Indian Evidence Act, it is expedient that the comparison of the footprints may be made so that the judge and the jury could see for themselves to what extent the footprints in question coincide. The summing up of the learned judge does not embody any observations on the value of the testimony of a footprint expert, in law.

The appeal is, therefore, allowed and the conviction and the verdict of the jury are set aside. The case shall go back to the Court of the Sessions for retrial.

6.12.4 Admissibility[21]

> *We are unable to accept this contention. The science of identification of foot-prints is no doubt a rudimentary science and not much reliance can be placed on the result of such identification. The track evidence, however, can be relied upon as a circumstance which, along with other circumstances, would point to the identity of the culprit though by itself it would not be enough to carry conviction in the minds of the court.*

The shoes had been recovered in the search of the house of the accused and the result of the search was proved by calling the search witnesses whose evidence was believed by both the courts with the result that these shoes, having been recovered from his house, the ownership of the shoes was *prima facie* established to be his even though the accused had alleged that he has not been staying in the house but had rented the house for some acquaintance of his.

There was evidence to show that he and his wife were staying there right up to 10 A. M. on June 9, 1953 on which day the search was made and if this evidence was believed it would go to establish his ownership of the shoes. If he was the owner of these shoes it was quite legitimate to compare the impressions made by these shoes with the mould prepared from the footprints on the spot.

The learned additional sessions judge, however, in order to derive further assurance attempted, in the examination of the accused under section 342, Code of Criminal Procedure to see if these shoes which had been recovered from the house of the accused fitted his feet. If the accused has refused to accede to this suggestion of the learned additional sessions judge he would have been justified in doing so and there is no provision in law by which this demonstration could have been made.

The accused, however, agreed to do so and on the shoes being tried on his feet. It appeared that they fitted his feet. Realizing however, that the result of this demonstration would be adverse to his defence he complained that the shoes were too tight for his feet.

---

20. *Ganesh Gogoi v State of Assam,* AIR 1955 Assam 51 : 1955 Cr LJ 437.
21. *Pritam Singh v State of Punjab,* AIR 1956 SC 415 : 1956 Cr LJ 805 (SC).

The learned additional sessions judge, however, thought otherwise and recorded his impressions accordingly. This type of evidence was very strongly criticised by the learned counsel for the appellant as real evidence which was not justified at all by the provisions of section 539 B, Code of Criminal Procedure or otherwise and it was urged that it was a matter which prejudiced the defence of the accused.

> *The learned additional sessions judge was certainly not entitled to allow his view or observations to take the place of evidence because such view or observation of his could not be tested by cross-examination and the accused would certainly not be in a position to furnish any explanation in regard to the same.*

The whole thing appears to have been done with the consent of the accused and the only criticism which could be legitimately levelled was against the observation recorded by the learned additional sessions judge that:

> *to all appearances they quite fitted the feet of the accused even though he complained that the shoes were too tight for his feet.*

This observation could not carry the matter any further for the prosecution and the only fact which could be relied upon by the prosecution was that the shoes apparently fitted the feet of the accused and the learned additional sessions judge and the assessors were entitled only to take into account the fact that the shoes apparently fitted the feet of the accused though he complained that they were too tight for his feet.

This was ocular demonstration and the result of such ocular demonstration could certainly be taken into account by the learned additional sessions judge and the assessors and they were entitled to come to their own conclusions taking into account the further fact that the accused did complain at the time that the shoes were too tight for his feet.

The evidence of the trackers and also the fact that shoes were found in the house of the accused and the impressions made thereby tallied with the moulds prepared from the footprints on the spot were even otherwise enough to establish the identity of the footprints and point to Pritam Singh Fatehpuri as one of the culprits.

The case of Pritam Singh Lohara in regard to the track evidence was no different. In spite of the fact that none of the witnesses of the occurrence nor Pritam Singh, the driver, had stated anywhere before that Pritam Singh Lohara had a limp in his gait, the result of the evidence of the trackers was sufficient to establish that one of the culprits made footprints which showed that his way of walking was outwards and he put his right foot more outwards than the left.

This was quite characteristic of Pritam Singh Lohara by reason of the limp in his gait and this was further demonstrated by the impressions which he made when he walked in the district jail with the shoes given to him there on the sandy patch which was specially prepared for the purpose.

> ***This evidence in regard to Pritam Singh Lohara also was believed by both the courts below as sufficient to establish his identity as one of the culprits and we are not prepared to differ from their appreciation of the evidence. The track evidence, therefore, was a circumstance which was available to the prosecution against Pritam Singh Fatehpuri and Pritam Singh Lohara.***

6.12.5 Track mark Identification Admissible[22]

> ***We examined and compared the footprints for ourselves and in our opinion, there is such a remarkable similarity between the admitted footprints of the accused-appellant, Surajpal Singh and the footprints in blood found on the spot that there is a high degree of probability that the footprints in blood found on the floor of the verandah of the***

22. *Surajpal Singh v State of Madhya Pradesh,* 1972 MPWR 394 : 1972 MPLJ 1029 : 1972 Cr LJ 1668 (MP).

accused-appellant, Surajpal Singh are the footprints of the accused-appellant Surajpal Singh.

In *Pritam Singh v State of Punjab,*[23] Bhagwati J., speaking for the court said:

> *The science of identification of footprints is no doubt a rudimentary science and not much reliance can be placed on the result of such identification. The track evidence, however, can be relied upon as a circumstance which, along with other circumstances, would point to the identity of the culprit, though by itself it would not be enough to carry conviction in the minds of the court.*

It was, however, unfortunate that it was not brought to the notice of the court that the identification of persons from footprints has many facets and all these facets could not be clubbed together and science of identification from footprints be dubbed as rudimentary science.

The identification of persons from footprints may broadly be classified as under:

1. Identification from footprints when the footprints show ridge characteristics. In such cases, the science is as accurate as the science of fingerprints. The prints of the foot of a person show ridge characteristics of his fingers and may be used in a similar way for the identification of persons from similarity of ridge characteristics.
2. Identification from footprints which have special characteristics apart from ridge, etc. Some feet have special characteristics such as a scar at a particular place, an extra or missing toe, a deformative peculiarity, etc. In this case, the value of identification is proportional to the number of peculiarities.
3. Identification of footprints which show neither ridge characteristics nor other special peculiarities. This is what we usually understand by identification from footprints though quite erroneously, because it is only one of the three categories of identification from footprints. This is based on what is known as 'Gayer System' as propounded by G.W. Gayer, I. P., in his book 'Foot Prints', An Aid to the Detection of Crime for the Police and Magistracy, (1909 First Edition). In this system which is based on the system of the '*Khojis*', who were professional trackers of Rajputana, a foot has 12 features namely the five toes called *Anguta*, *Dusri*, *Tesri*, *Chouthi* and *Chichi*, the head line of the ball of the foot called *Zanjiri*, the ball of the foot called Pab, the instep called Talli, the length of the foot from uppermost point of Anguta to the lower most of the heel (Eri) called Chab, the heel called, Eri, the inner margin of the foot called, Bari Assi and the outer margin of the foot called Choti Assi. According to the author every one of the these twelve features has as much characters as the features of a face. Once a pupil learns to distinguish them at a glance, he is able to recognise a person from his foot impressions as easily as he can from his face. These features and their characteristics are compared with reference to three guidelines; the first is a vertical line going from the highest point of the big toe (Anguta) to the centre of the heel (Eri), the second line is at right angle to the aforesaid line running under the base of the little toe (Chichi) and the third joins the highest point of the big toe to the top of the little toe and joins the second line. The author further says at page 3:

   > *It is obvious that every individual's footprint must have a distinct individuality for even if there were only three common types of each of the features; and we had nothing else to go on, the total possible number of different types would be 531441, so that, on the average, two feet in about every million would be similar. A careful study of the illustrations and of the text will show that these figures do not err on the side of exaggeration.*

23. *Pritam Singh v State of Punjab,* AIR 1956 SC 415 : 1956 Cr LJ 805 (SC).

Again at page 6, paragraph 30, the author to avoid possibilities of error in identification says:

> *When two impressions are being compared with each other with the object of finding out if both have been made by the same foot one thing must be clearly understood, if they are impressions of the same foot they will agree in all essential points and there will be no points of disagreement. If there are points of disagreement and these have not obviously been caused by some peculiarity or irregularity of the ground, or by some accident, it should be at once admitted that the impressions are those of different feet.*

Rejecting the contention that the study of footprints is not a science in *Din Muhammad v Emperor,* Central Provinces Police Gazette, dated 27 May, 1914 pp. 125-130, the court of the Judicial Commissioner at Nagpur (H.J. Stanyon and H.F. Hallifax, A.J. Cs.) as far back as in 1914 held:

> *Now the knowledge of handwriting and that of finger impressions have been systematised and arranged under general truth and principles by many writers and pursued by many enquiries, and they are both sciences in which a great deal of progress has been made. The knowledge of footprints has similarly been systematised and pursued by trackers, mainly uncivilised and ignorant people in all other respects, all over the world, and also at the Saugar Police Training School under Mr. G.W. Gayer, who has arranged the knowledge he obtained from other seekers and from his own observations and experiments in a valuable monograph entitled 'Footprints'. The matter is, therefore, undoubtedly a science and the opinion of a person specially skilled in it is a relevant fact, under section 45 of the Evidence Act.*

In the instant case the points of similarities are 9 in respect of the right foot impressions, 10 in respect of the left foot impressions and the points of dissimilarities are three only in each case which have been explained by the expert (P.W. 13) is due to the different densities of the media in which the foot impressions were made namely, printer's ink and blood. The comparison has thus stood the test well and, under the circumstances these foot impressions in blood near the place of the incident which are proved to be those of the accused-appellant Surajpal Singh by preponderance of probabilities are a strong incriminating circumstance against the accused-appellant Surajpal Singh for which he has not accounted.[1]

6.12.6 Footwear Evidence — Police Padding[24]

The recovery of the pair of shoes of the deceased from the courtyard of the house of the accused also appears to be a case of police padding. After the accused persons had taken care to conceal the weapon of offence, the parts of the dead body, the clothes of the deceased, the photographs of the deceased with Mst. Asma Bi, the letters written by Mst. Asma Bi to the deceased, and had also taken great care to wash the floor of the house which they were occupying to remove all traces of bloodstains there is no earthly reason to suppose that they would have left the pair of shoes of the deceased in the courtyard of their house to enable the police to recover the same. Apart from this there is one more significant aspect which requires consideration. There is no evidence on the record to show that this pair of shoes was the only pair of shoes which the deceased had or that when he was last seen alive he was wearing that pair of shoes. In the absence of any evidence on the record to show that immediately before the deceased was seen alive he was wearing that particular pair of shoes no inference can be drawn against the accused from this recovery of the pair of shoes. After giving my careful consideration to this aspect of the matter, I find that the so-called recovery of shoes of the deceased does not advance the case of the prosecution at all. The recovery of the pair of shoes under the circumstances does not connect the accused with the crime.

24. *Mazahar Ali v State of Jammu and Kashmir*, 1976 Kash LJ 179 : 1976 Cr LJ 1629 (J&K).

6.12.7 Track Evidence as a Circumstance[25]

Learned counsel for the parties, however, in this court referred to a number of decisions of this court as well as of Allahabad High Court bearing on the question of the value of expert evidence on the matter of footprint. Learned counsel for the appellant has contended that the so-called science of detection of crime by means of footprints, alleged to have been left by a criminal at the scene of occurrence, is still too undeveloped to give any basis for forming any judicial opinion with regard to the guilt or otherwise of the accused persons.

Learned counsel for the State, however, has contended that the science has developed to such an extent that valuable clues to the presence of an accused can be derived from an examination of the footprint of a culprit left on the scene of occurrence or at relevant points while running away. The first question for consideration in this connection is whether there is any provision in the Indian Evidence Act to make footprint legally admissible. Section 45 has been referred to in this connection, which runs thus:

> *When the court has to form an opinion upon a point of foreign law, or of science or art, or to the identity of handwriting (or finger impressions), the opinions upon that point of persons specifically skilled in such foreign law, science or art, or in question as to the identity of handwriting (or finger impressions) are relevant facts.*

The section deals generally with what is called expert evidence. It has been contended on behalf of the appellant that section 45 in terms, refers to finger impressions only and not to footprints, and as such evidence based on the alleged footprint of the criminal compared with his genuine footprint should not be held to be admissible.

Reliance is placed in support of this contention on the case of *Oomayan (re),* AIR 1942 Mad 452 *Paramban Mammadu (re),* AIR 1951 Mad 737, *Ganesh Gogoi v State of Assam,* AIR 1955 Assam 51 and *Pritam Singh v State of Punjab,* AIR 1956 SC 415. The case reported in *K.K. Subbier v Lakshmana Iyer*, AIR 1942 Mad 452 : 43 Cr LJ 770 is a single judge decision of Horwill, J. where it has been laid down that experts in footprints are not recognised by the Evidence Act. There is no reference, however, made to any particular section of the Act. It was, however, further held in that case that:

> *A magistrate is entitled to take into consideration the evidence of a person, who has seen a footprint and taken the footprints of the accused and found that they are very similar. That evidence is not, however, sufficient to bring home the offence to the accused in the absence of further knowledge regarding the differences between one foot and another.*

In substance, therefore, it was held that such evidence could be looked into by a court of law although a person making such comparison could not be regarded as giving expert evidence as provided in section 45 of the Evidence Act. In the case of *Paramban Mamair madu (re),* AIR 1951 Mad 737*,* which is a Bench decision of that court, delivered by Horwill, J. *Supra)* the learned judge held that opinion of a footprint expert is not admissible as evidence.

The learned judge has, no doubt, referred in detail to the value of such evidence giving reasons why such weight should not be attached to such evidence. As regards the Indian Evidence Act, however, there is no reference to any particular provision of the Act nor any discussion of the legal position. In my opinion, therefore, this case cannot be looked upon as a considered authority on the applicability of section 45 of the Evidence Act to decide whether evidence of a footprint expert can be acted upon by a court of law as good evidence. In the case of *Ganesh Gogoi,* it was no doubt observed that the word 'footprint' does not occur in section 45 unlike the word 'fingerprint' so that footprint cannot be taken as included within the ambit of that section. The evidence of the witness having held the comparison of the

25. *Basudev Gir v State of Bihar,* AIR 1959 Pat. 534 : 1959 Cr LJ 1355 (Pat).

footprint was yet held to be admissible on the ground that the judge and jury could see for themselves as to what extent the footprints coincided. This case, thus, can be taken to have followed the rational in *Oomayam (re)*. In the case of *Pritam Singh v State of Punjab*, AIR 1956 SC 415 there is an observation to the effect that the science of identification by footprints is a rudimentary science and much reliance cannot be placed on the result of such identification.

The track evidence, however, can be relied upon as a circumstance which, along with other circumstances, would point to the identity of the culprit though by itself it would not be enough to carry conviction to the mind of the court. That decision also does not lay down that such evidence is not admissible under the provisions of the Indian Evidence Act. If anything, the observation would point to the conclusion that such evidence would not be inadmissible but that much reliance could not be placed on such evidence on account of the undeveloped stage of scientific knowledge in regard to footprint. Learned counsel for the State, however, has drawn our attention to the case of *Mannian Velayudhan,* which is a Bench decision of the Madras High Court consisting of Govinda Menon and Mack, JJ. printed in the Bihar Criminal Intelligence Gazette, dated 6th July, 1956, where there is an elaborate consideration of the applicability of section 45 of the Indian Evidence Act to the evidence given by an expert on the footprint under consideration in the criminal trial.

With respect, I agree with the observation of Govinda Menon, J. when his Lordship held the opinion of an expert in footprints admissible under the heading "science" occurring in section 45. Their Lordship in their judgment expressed their disagreement with the view adopted in the case of *Paramban Mammadu (re),* AIR 1942 Mad. 452 and the case of *Oomayam (re).*[3] In my opinion, the word "science" which has been defined in the Universal Dictionary of English language, referred to by the learned judge, as great proficiency, dexterity, skill based on long experience and practice, is sufficiently wide to include the evidence of an expert.

The learned judge has referred in that connection also to a book *Modern Criminal Investigation,* by Dr. Harry Soderman, Chief Director of the National Institute of Technical Police, Sweden, wherein he has referred to the fact that some maternity hospitals in America, where prints of the sole of new born babies are taken for identification purposes, it is considered to be a reliable test for identifying the child. I may also refer in this connection to the fact that section 45 of the Evidence Act, as it stood prior to its amendment by Act V of 1899, did not contain the words "finger impressions" evidently, because the Legislature thought that the section as it stood was comprehensive enough to cover the opinion of all experts in foreign law or science or Art.

There was, however, a decision of the Calcutta High Court in the case of *Queen Empress v Fakir Mohammad Sheikh,* 1 Cal WN 33 where it was held by Banerjee, J that the opinion of an expert as to the identity of thumb impression was not admissible under section 45 of the Evidence Act. It was with a view to obviate the conclusion of the learned judge in that case that the Legislature thought it fit to incorporate the words "finger impression" in specific terms. The reasons for the amendment quoted by Sarkar in his book on the *Law of Evidence in India* are relevant for the present purpose as well. The quotation runs thus:

> *The system of identification by means of such impressions is gaining ground and has been introduced with considerable success especially in the Lower Provinces of Bengal. It seems desirable that expert evidence in connection with it should be admitted, and with that object it is proposed by Clause 3 of this Bill, expressly to amend the law on the subject.*

In my opinion, that amendment indicates the policy of the Legislature regarding progress in science and accordingly, I agree with the opinion of Govinda Menon, J. that the word "Science" occurring in section 45 should be held to be comprehensive enough to include the opinion of the expert in footprints as well.

Learned counsel for the appellant has, however, contended that at least in the present case the evidence of the expert should be discarded as valueless, because there was no complete footprint, found on the gramophone record but only a partial footprint. Even the expert admitted in his evidence that no positive opinion of identity could be given by him since the full footprint impression was not available. The expert, however stated further:

> *There is no chance of the photo* A *being of any other person. The chance is very remote, we are very conservative in our opinion, and unless we get full data we do not give positive opinion. If certain features in one print agree with relative position in another print, then the remaining portion if appeared would also have agreed.*

In this particular case the prints of bridge and the heels were necessary for giving a positive opinion. Bridge and heels are missing in the photo marked *A*.

Giving reasons for his opinion, he said as follows:

> I compared the print marked 'A' with all the nine specimens of the nine suspects including the prints *X, X-1 and X-2.* Print marked A by me was found to be similar with the correlative right footprint portion of the suspect Basudeo Gossain marked *X, X-1 and X-2.* The common correlative peculiarities have been marked out by me on the photographs marked *A* and *X* by me. The reasons of my opinion are as follows:
>
> They are similar in physiognomy. The distribution of the toes is similar. The nature of the lines at central portions in the toes are similar, which are clear in *A* and very clear in *X.* The second toes and the third toes are close in both. The fourth toes and the fifth toes in both are apart. The *zanjiri* lines below the toes are similar in both, in their concavities and convexities. The ball portion below the toes and *zanjiri* lines so far available are similar in both. For superimposition check chart, I have traced *A* and *X* both on a sheet of glass and have superimposed the tracing of *A* and *X,* and of *X* and *A*, and they fall in their correlative position.

A look at the photograph of print *A*, however, shows that the second and third toes are joint which is not the case on the genuine footprint of the portion marked *X, X*-1 and *X*-2. The expert (P.W. 6), who came to the court to explain the position, stated to us that a slight difference was due to the medium. The two fingers (toes) appear to be joint because there might be an external medium such as mud or sweat sticking to the toes of the appellant. That matter, however, has not been explained in the evidence given by him in the court of the judicial commissioner.

In the circumstances, even if the evidence of the expert (P.W. 6) be left out of consideration, the evidence of P.W. 1 Ramkishun Ram would be sufficient to uphold the conviction of the appellant. This evidence, however, stands corroborated also by the fact that he admitted in his examination under section 342, Code of Criminal Procedure that he was made to give his footprint on a gramophone record by the investigating officer holding out a temptation that he would be let off if he agreed to do so. I have already held that this explanation is palpably false. It is obvious, therefore, that the court would be justified in holding that the footprint on the gramophone record was his and the circumstance could be put in weight against him.

In the result, it must be held that this appeal has no merit and it must be dismissed.

6.12.8 Improper Testimony[26]

Now I take up the evidence of the footprint expert. His evidence with regard to footprint is unreliable and inadequate. It would be hardly fair to dub him an expert in footprint because he has got no experience in this line. Prior to this case, twelve years ago he had occasion to examine

26. *Fakirchand v State of Madhya Bharat,* 1955 Cr LJ 1073 (MB).

footprints. He went to the spot and found that there were footprints in blood on the '*farsi*' (paved floor). He got the footprint on the '*farsi*' impressed on a plain glass, then traced them on a paper. Several people were made to walk on road filled with earth and from footprint, made on earth, he compared them with the footprints traced on paper and taken from the bloodstained '*farsi*' and he gave opinion that the footprints were of accused Fakirchand.

The expert has not given any scientific tests from which he came to the conclusion that the footprints of Fakirchand on earth tallied with the footprints made on bloodstained *'farsi'.* He has not kept the trace of Fakirchand's footprint impression on the earth on road so that a comparison can be made with the footprint trace taken from the *'farsi.* He does not say whether the pad and toe impression were similarly identical. In fact he assigns very inadequate and unsatisfactory reason for coming to the conclusion that the footprints on the *'farsi'* at the scene of occurrence are those of accused Fakirchand.

The learned judges below have simply accepted the opinion of the expert as gospel truth and they could not form their own independent opinion. In a murder case, before relying on the opinion of the expert as to footprints found near the corpse of the deceased as conclusive evidence against the accused, the judge should form his opinion with regard to the identity of the footprints found near the corpse with the footprints of the accused.

6.12.9 Probable Evidence[27]

The next branch of Mr. Ghosh's submission relates to footprints and the nature and effect of the evidence of the expert thereupon, P.W. 16. "The witness (P.W. 16), is the expert on footprints attached to the Forensic Science Laboratory, Medical College, Calcutta. On 16th August, 1966, he received amongst others one leather slipper of the left foot marked 'Y' by him and 4 specimen footprints marked 1 to 4. The slipper is exhibit 7 and the specimen footprints are exhibits VII to X. He stated that some comparable features could be deciphered from the slipper marked 'Y'. On comparison similarity in features was noticed between the slipper marked 'Y' with left foot specimen footprint marked '1' by him. He was ultimately of the opinion that in all probabilities marks 'Y' and '1' are production of the one and the same left foot. Mr. Ghosh has contended that the evidence of the footprint expert is not sufficient to connect the accused appellant with the crime. Upon an analysis of the said evidence we agree with Mr. Ghosh. It is passing really strange that an expert in his ultimate opinion would depend on probabilities and not on firm conviction in the absence whereof the said evidence would become dangerously thin indeed and the court of law would not take that by itself into consideration for the purpose of fixing the guilt of the accused. The expert having reached the point of interrogation or of probability, cannot be relied upon for the purpose of a conviction in a case under section 302, Indian Penal Code. It is difficult for us to comprehend as to how the expert was satisfied by comparing the specimen footprint of the accused, as taken, marked '1' with the slipper of left foot, marked 'Y'. It is also difficult to understand as to how marks 'Y' and '1' being photographed in superimposed manner in his presence and enlarged thereafter could be of any material help in connecting the accused with the crime.

Apart from the nature of the evidence of the expert as discussed above, the science of identification by footprint impression is still an imperfect science and it is inexpedient to place reliance on the result of such identification. Several authorities on the subject have been referred to before us, apart from the case law cited on the point, both by Mr. Prasun Chandra Ghosh and Mr. S. Banerjee, the learned D.L.R. In support of his contention Mr. Ghosh has referred to the observations of Charles E. O'Hara and James W. Osterburg made in their book

27. *Bhulakiram Koiri v State of West Bengal*, 1970 Cr LJ 403 : 73 Cal WN 467 : ILR (1969) 1 Cal 39.

'An Introduction to Criminalistics'. In the 4th printing (1960) of the said book the authors have observed at page 107 that:

> *It is not always a simple matter to identify the shoe of suspect as being unquestionably shoe that made the shoe impression at the scene of the crime. The large-scale manufacture for a few predominant brands of shoes give the defence counsel grounds of establishing a strong doubt concerning the unique correspondence between the cast of the impression and the defendant's shoe. In many cases, the sole of the cast is without characteristics except for the shape of shoe. The era of cheap shoes has led many people to the habit of purchasing new shoes rather than repairing old ones.*

By referring to the principles laid down therein about the walking pattern, Mr. Ghosh has submitted that the method as adopted in the present case, upon his own admission of P.W. 16, has not conformed to the norms enjoined in this behalf. Mr. Banerjee has referred to the book on *'Footprints'* by G.W. Gayer (Ist Edn. 1909). At page 6, the author has observed that:

> *When two impressions are being compared with each other with the object of finding out if both have been made by the same foot, one thing must be clearly understood, if they are impressions of the same foot they will agree in all essential points and there will be no points of disagreement.*

The difficulty in present case is regarding the two impressions as sought to be compared by the expert and there even the expert has only found 'some comparable features' and not an agreement in all essential points. Mr. Gayer has further observed at page 12 of the said book that:

> *It is useless to compare measurements of feet with measurements of impressions of feet left on the ground because the sole is very liable to spread when pressure is brought on it.*

We agree with the said observation and hold that the said difficulty obtains in the present case also. Mr. Banerjee referred in the next place to the treatise on *'Modern Criminal Investigation'* (5th Edn.), by Dr. Harry Soderman and John O'Connell. The learned authors have observed that:

> *From the view point of criminology, sole-prints are not as important as finger and palm prints, but occasionally they may have some measure of importance.*

Thereafter the authors have discussed the classification for this purpose as devised by Wilder and Wentword and by Dr. Emil Jerlov of the Maternity Hospital of Halsingburg, Sweden. As to the identification of footprints it has been further observed in the said book at page 166 that:

> *In order to get a true picture of the formation of the foot in different positions it is necessary to take four different footprints, namely, in normal standing position, in walking, in a standing position with pressure on the outer portion of the foot, and in a standing position with pressure exerted on the inner part of the foot.*

It, would, therefore, appear that the comparison as made in this case is defective and no fool-proof opinion can be advanced on the basis of the same. We may refer in this connection to the well-known treatise on *Criminal Investigation,* as adopted by J. Collyer Adam (1924 Edn.) from the *"System der kriminalistik"* of Dr. Hans Gross. The same is an authority on the subject and has been referred to by G.W. Gayer and also both by Dr. Harry Sodderman and John J.O'Connell and by Charles E. O'Hara and James W. Osterburg. As to the importance and use of footprints the learned author has observed at page 325 of the said book that:

> *As a rule footprints are but seldom found where they are wanted. Moreover, when they exist, they are rarely entire and complete, and for that reason are considered of no value..... On the other hand when well preserved traces do exist, the essential thing is to be able to interpret them and to know how to make good use of them. On this science is dumb and has hardly even approached the question.*

As to the reproduction of footprints, he has further observed at page 363 that:

> *We trust it is unnecessary at this stage to repeat that all important impressions must be reproduced. One can hardly imagine an investigating officer so indifferent or so inexperienced as to experiment with the original footprint itself. It is, however, a fact that such persons exist, so that we cannot too strongly point out the danger of damaging an impression.*

Unfortunately, however, the examination in this case of the foot impression suffers from the said defect and the method as adopted has been quite unsatisfactory and has resulted in a serious prejudice to the accused appellant.

In this connection reference has been made to several decisions on the point. Mr. Ghosh has referred to the decision in *Bhikha Gober v Emperor,* AIR 1943 Bom 458, by Chief Justice Beaumont and Mr. Justice Sen, Chief Justice Beaumont delivering the judgment held at page 460 that it is not sufficient:

> *that the foot-marks tallied with the accused's shoes. That may mean no more than that these marks were made by shoes of a size corresponding to the size of the accused's shoes. That is not enough. There may be a large number of shoes in village of the size of the accused's shoes. The evidence must go further and show that the marks had some peculiarity which was found in the shoes of the accused, and would not be found in most other shoes.*

The next case cited in that of *Re Paramban Mammadu,* AIR 1951 Mad 737 Mr. Justice Horwill and Mr. Justice Rajgopalan observed at p. 740 that:

> *The opinion of a footprint expert is not admissible as evidence ..... The value of evidence with regard to footprints is obviously very much less trustworthy than evidence with regard to fingerprints..... With regard to footprints, on the other hand it would seem from the evidence and from what we have been able to read from Dr. Hans Gross's book on Criminal Investigation that one can only compare with the general shape of footprints found with the shape of impressions taken from the feet of the person suspected.*

The next case cited by Mr. Ghosh is that of *Ganesh Gogoi v State of Assam,* AIR 1955 Assam 51, Chief Justice Sarjoo Parasad and Mr. Justice Ram Labhaya delivering the judgment observed at page 54 that:

> *Section 45, Evidence Act, does not include footprints within its ambit as it does the finger impressions. Notwithstanding this omission, the evidence of footprint expert has been admitted with the qualification that there should be other evidence to bring home the charge to the accused. The rule on the point is that the opinion of the footprint expert would not by itself suffice to base conviction on and the rule has been applied to testimony of other experts including experts on fingerprints.*

A reference was also made to the decision by Mr. Justice S.C. Misra and Mr. Justice U.N. Sinha in the case of *Basudeo Gir v State of Bihar,* AIR 1959 Pat 534, Mr. Justice Misra referred to the various authorities and decisions on the point and observed at page 586 that:

> *In my opinion, the word "science" which has been defined in the Universal Dictionary of English language, referred to by the learned judge, as great proficiency dexterity, skill based on long experience and practice, is sufficiently wide to include the evidence of an expert.*

Mr. Justice Sinha agreed with the said view and referred to the two previous decisions by the Patna High Court, namely, in the case of *State v Karu Gope,* AIR 1954 Pat 131, and in the case of *Ram Karan Mistri v State of Bihar,* AIR 1958 Pat LR 246, wherein the opinion of the expert was considered "on merit without any reference to section 45 of the Indian Evidence Act." It is quite true that in section 45 of the Indian Evidence Act there is no mention of footprint impression in specific terms. As a matter of fact the words "finger impression" were added by section 3 of the Indian Evidence Act (5 of 1899). In this context it would be pertinent to refer to the case of *Queen-Empress v Fakir Md. Sheikh,* (1979) 1 Cal WN 33 where Mr. Justice Banerjee held at page 35 that:

> though the comparison of thumb-impression is allowable, such comparison must be made by the court itself; and the opinion of the expert as to the similarity of such impression is not admissible under section 45 of the Indian Evidence Act.

It is also pertinent to consider that in Ceylon section 45 of the Indian Evidence Act has been amended to include the words "palm impression" wherever they occur in this section. Therefore, the state is not in a flux so far as Ceylon is concerned. However, as has been held in AIR 1959 Pat 534 such evidence by an expert on footprint could come within the ambit of the word "science", as used in section 45 of the Evidence Act. The utmost bounds of human thoughts are, however, ever expanding and the outer periphery of science are extending everyday. The expression "science" is accordingly acquiring a wider connotation in the world today. Identification of people by smell or even by their teeth are now in vogue and are considered to come within the ambit of "science". Forensic Odontology or the science of identifying people by their teeth was recently relied upon for the detection of crime in the High Court at Edinburgh. The cloud, however, has been lifted and the point settled in the case of *Pritam Singh v State of Punjab,* AIR 1954 Pat 131 decided by Mr. Justice Bhagwati, Mr. Justice Venkatarama Ayyar and Mr. Justice Sinha, Mr. Justice Bhagwati who delivered the judgment observed at page 423 that:

> *The science of identification of footprints is no doubt a rudimentary science and not much reliance can be placed on the result of such identification. The track evidence, however, can be relied upon as a circumstance which, along with other circumstances, would point to the identity of the culprit though by itself it would not be enough to carry conviction in the minds of the court.*

We hold, therefore, that it is unsafe to base a conviction on the basis of the expert's evidence alone regarding footprint or sole print. As considered in the light of the observations made by the various authorities on the subject and in view of the principles laid down in the different cases on the point, the science of footprint or sole print or of track evidence appears to be still in an embryonic stage. It may have travelled beyond the stage of crude empiricism but has not yet reached the stage of an exact science.

6.12.10 Footprint Evidence — No Data[28]

Next we come to the footprints stained with blood found in the courtyard. We find from the evidence of P.W. 19 that he found 5 footprints. He selected three out of those as fit for examination. Amulaya Chandra Sahu (P.W. 28) and Durvodhan Barik (P.W. 21) were directed by him to take photographs. Thereafter glass tracing was done by him. Specimen footprints of Basu and Kanhu were also taken. Only one footprint was found suitable and on comparison the specimen footprint of Kanhu resembled the footprints as reflected in Exts. 14, 15, 16 and 16/1. He proved the report Ext. 20. P.W. 19 stated:—

> *.....In the opinion Ext. 20 we are definite that the footprint marked 'A' as Exts. 14, 15, 16 and 16/1 has resemblance with the footprints in the document marked 'X'. In report Ext. 20 we said 'some resemblance' because the footprints in Exts. 14, 15, 16 and 16/1 were partial footprints which completely tallied with the corresponding part of the footprint reflected in the document marked 'X' for identification which is the full footprint of Kanhu Barik. True it is the reason assigned by me today in the foregoing lines do not find place in Ext. 20 because these details were not at all necessary. There was no ridges and therefore, the number of ridges taken into consideration does not arise.....*

28. *State of Orissa v Kanhu Charan Barik*, 1983 Cr LJ 133. Also see *Mangobinda Swain v State of Orissa*, 1978 Cr LJ 127 : 1977 Cut LR (Cri) 132; *Shankaria v State of Rajasthan*, AIR 1978 SC 1248 : (1978) 3 SCC 435 : 1978 Cr LJ 1251 (SC).

The reasons in support of the said opinion are lacking. The report is not conclusive proof. Evidence of experts after all is opinion evidence. The opinion is to be supported by reasons. The court has to evaluate the same like any other evidence. The reasons in support of the opinion, if convincing, make the opinion acceptable. There is no place for *ipse dixit* of the expert. It is for the court to judge whether the opinion has been correctly reached on the data available and for the reasons stated. We quote from the decision of the Supreme Court in *Murarilal v State of Madhya Pradesh*, AIR 1980 SC 531 : 1980 Cr LJ 396 (Para 4).

> *.....But the hazard in accepting the opinion of any expert, handwriting expert or any other kind of expert, is not because experts in general, are unreliable witnesses – the quality of credibility or incredibility being one which an expert shares with all other witnesses, but because all human judgment is fallible and an expert may go wrong because of some defect of observation, some error of premises or honest mistake of conclusion. The more developed and the more perfect a science the less the chance of an incorrect opinion and the converse if the science is less developed and imperfect. The science of identification of fingerprints has attained near perfection and the risk of an incorrect opinion is practically non-existent. On the other hand, the science of identification of handwriting is not nearly so perfect and the risk is, therefore, higher. An expert deposes and not decides. His duty is to furnish the judge with the necessary scientific criteria for testing the accuracy of his conclusion, so as to enable the judge to form his own independent judgment by the application of these criteria to the facts proved in evidence.*

Their Lordships further stated in para 11:—

> *.....Reasons for the opinion must be carefully proved and examined ..... In cases where the reasons for the opinion are convincing and there is no reliable evidence throwing a doubt, the uncorroborated testimony of a handwriting expert may be accepted .....*

Following the aforesaid dictum of the Supreme Court and agreeing with the counsel for the appellant, we exclude the evidence of footprints as in Exts. 14, 15, 16 and 16/1 and Ext. 20 and the evidence on this question as given through P.W. 19 from consideration, as having no probative value. It is worthwhile to note that the expert does not say that the specimen footprints were identical with the foot prints as per Exts. 14, 15, 16 and 16/1. On the contrary, in Ext. 20 he says that there was "some resemblance". He admits that there were no ridges and so, consideration of ridges did not arise.

'It was, however, unfortunate that it was not brought to the notice of the court that the identification of persons from footprints has many facets and that all these facets could not be clubbed together and science of identification from footprints be dubbed a rudimentary Science!

Naik, 1972 (MP HC)

Mechanical Fit + Corresponding Striations

7.1 NATURE

7.1.1 Definition

A tool mark is a print/impression punched/engraved/moulded mark on a surface. It may be due to an impact, abrasion, cut, scoring, insertion, engraving or grooving. The depth and clarity of the tool mark on the force and the angle at which the tool meets the object and the nature of the contacting surfaces. Simultaneously, it may exchange material traces with the surface of contact also. If the impacted surface is hard, it may also damage the tool and/or create its marks on the tool. The present study is mainly relating to tool marks Forensics and related phenomena.

A tool mark is a physical evidential clue, often found at the crime scene. If the mark is from a tool recovered from a suspect, the mark links the crime/crime scene with the tool and *inter alia* with the suspect/culprit.

7.1.2 Types of tool Marks

The tools leave two types of marks:

1. Class tool marks
2. Individual marks

Class tool marks are characteristic of the class of the tool to which the tool belongs. They indicate the type but do not identify the individual tool. Their main advantage is that they limit the tool to one class.

Individual marks are unique to the tool used. They permit definite linkage of the tool with the incriminating marks and consequently with the perpetrator of the crime.

The individuality of the tool is due to the manufacturing defects, accidental damage to the tool and wear/tear of the tool.

7.1.3 Classification

Tool marks classifications are based on:

1. The mode of creation, and
2. The nature of marks

The mode of creation gives the following categories:

7.1.3.1 Sliding or dynamic marks

When the tool makes sliding contact with the recipient surface, it creates striations/scratches on the surface. For example, when a bullet, of appropriate diameter, passes through a rifle barrel, the barrel creates striations on the bullet. These striations are used to link the rifle with the bullet. If this bullet happens to kill a person, the killer rifle (and hence its owner) are linked in a homicide case.

Here rifle acts as a tool.

7.1.3.2 Cut Marks

Cut marks are created by sharp-edged tools/weapons like swords, knives, sickles, axes, scissors, wire cutters, shears and pliers. They generally create striations, which are unique to the tool. They are found in all sorts of crimes, more frequently in theft cases and sometimes in murder cases also.

The tool may also carry traces from the cut object and kelp link the tool with the crime.

In a case of murder, the culprit acted clever. He sawed off his unlicensed gun to hide it on his person while taking it to the scene of offence. He murdered the person and then placed the gun in the victim's hand after wiping off his fingerprints from the gun, to simulate suicide. He left the scene un-noticed.

Later, the police arrived at the scene and thought it was a case of suicide. Then the investigator noticed that the barrel of the firearm was freshly cut. Where is cut piece of the cut barrel?

They searched the scene for the cut piece of the barrel and for the hacksaw. They could not find them. The fresh cut had created a strong suspicion that perhaps another person was involved in the shooting and he had shortened the barrel to make it easy to conceal the firearm on his person. The absence of the barrel piece and the hacksaw on the victim's premises strengthened their suspicion/belief.

The case was registered as murder and a search for the culprit was started. A hacksaw was found on the premises of one of the suspects, but no barrel end. The investigating officer found some sparkling particles lodged in the teeth of the hacksaw. They might link the hacksaw with the gun found at the scene of murder. Both the hacksaw and the gun were sent to the departmental Forensic laboratory.

Trace elemental profiling of the particles on the hacksaw and of the barrel metal were developed and compared. The profiles matched. The trace from the barrel on the hacksaw linked the culprit with the crime. (CH)

7.1.3.3 Impact/Static marks

A tool creates impact/static marks (also called indentations) when it comes in non-sliding contact with the object with some force. Normally, the impacting tool is of a harder material than the recipient surface. Hammer, punches, and dies are the obvious examples. However, staff/stick/stone/crowbars/hands/shoes and many other hard objects create impact marks. The marks (firing pin, breach face, chamber marks), on a fired cartridge from a firearm, are also impact/static marks, are facsimiles of the impacting surface, if fully printed.

7.1.3.4 Repetitive Action marks

The common examples of repetitive action marks are multiple hammering, sawing movement of the saw and marks from the boring drill. They often do not permit the identification of the creating tool. However, in some cases, when there is some defect(s) in the working edge of the tool, it may be possible to link the tool with the marks.

The nature of the marks/evidence classifies them as under:

1. Indentations/impact/munch marks
2. Scrapes
3. Saw marks
4. Drilled holes
5. Engrave marks
6. Contact marks
7. Prints (from printing blocks, numbering and dating machine)
8. Painted marks
9. Broken and severed Parts
10. Extraneous material (not a tool mark but associated evidence sometimes)

Strictly speaking, only the first five types are tool marks. Others (the last four) are entities connected with tool marks so intimately that it is perhaps better to discuss them along with tool marks.

7.1.3.5 Indentations/Impact Marks

An indentation is caused by a tool when it is pressed upon a surface without sliding motion, *i.e.,* by the static impact. The mark contains the outline of the tool surface with its irregularities, which comes in contact with the impacted surface. The transfer of marks is often partial. The clarity and individuality of the mark depends on the surface of the tool, the force of impact, and the nature of the recipient surface.

Fig. 7.2
Air rifle pellet mark on wind screen of a jeep allegedly fired by some culprit

The following tools leave indentations:

1. Hammers
2. Punches
3. Dies
4. Metallic seals and stamps
5. Stones, bricks and other articles used to cause impact
6. Maces

Sometimes, tools like knives, chisels, jimmies, crowbars, screwdrivers and axes also leave indentations.

It is often possible, in most cases, to connect a tool positively with an indentation left at the scene of occurrence, which decisively links the criminal with the crime.

7.1.3.6 Scrapes/Sliding Marks

Sliding contact of a tool with the recipient surface creates scrape marks. The surface is scratched in a characteristic fashion depending upon the irregularities (nicks and protrusions) of the scratching surface of the tool.

All types of tools create scrape marks (striations) in sliding contacts, prominently the following tools:

1. Cutting tools like swords, knives, axes, scythes, shears, wire cutters, hatchets, scissors.
2. Chisels, can-openers, crowbars, screw drivers.
3. Pliers and wrenches used to turn nuts, bolts and pipe fittings.
4. Shovels used to dig earth.
5. A moving vehicle is scratched when it slides along a protruded object like pieces of projected stones, bricks, metal or wood.
6. Marks on a bullet, scrape marks of protruding firing pin on the base of a cartridge.

Scraping scratches the surface and creates striations (lines). The width, depth, and inter-distances of the striations vary to a certain extent depending upon the angle of application, the force used and the relative hardness of the two surfaces.

Striation marks are encountered frequently in criminal investigations.

7.1.3.7 Saw Marks

Saw marks, including hacksaw marks, are repetitive action marks. They permit the identification of the tool only in rare cases. When the whole length is cut through, the saw or the hacksaw leaves its pattern of the cut surface. It indicates the number of teeth per unit length. Broken teeth, their number, position, and shape allows positive identification of the tool, in most of the cases, where they occur.

7.1.3.8 Drill Marks/Holes

Holes dug by drills and bits in wood rarely permit their linkage with the creating tool. If the hole is not through and through, the base (bottom) of the hole may carry the identifiable pattern of the end surface of the drill in the form of an indentation of the surface of the tool. The indentation may permit a positive linkage of the mark and the tool.

7.1.3.9 Punch Marks

Punch marks are quite common in human life. The identification data is punched on many objects (especially on metal objects). Outstanding examples include firearms, vehicles and ornaments. The punched marks are often identifiable in respect of the punch used to create the marks.

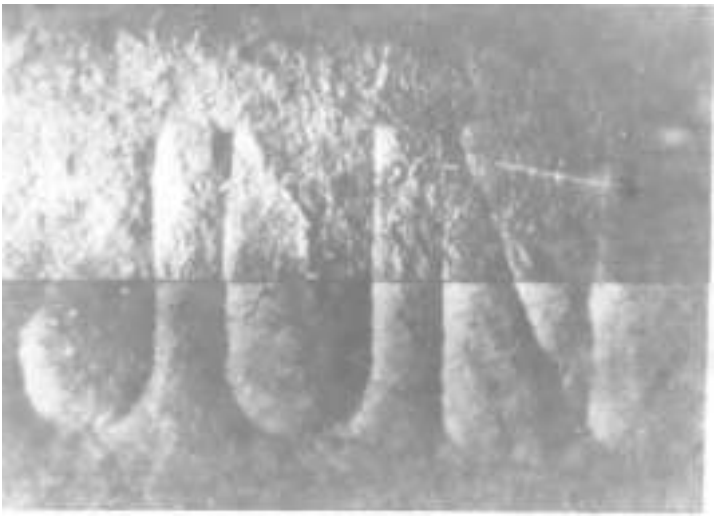

Fig. 7.3
Marks from the Same Punch

Fig. 7.4
Marks not from the Same Punch

7.1.3.10 Dies

Dies like punches, are used to stamp identification and other data on objects. The die used to create the mark is unique and therefore permit definite linkage of the die with its mark in most of the cases.

7.1.3.11 Engraved Marks

Engraving of identification and other marks or logos, the design is common on metal objects including on jewellery, small arms, decoration pieces, and machinery. When they are stolen, the thief often erases them to hide their identity.

Resuscitation of these obliterated marks to identify their identities and *inter alia*, that of their owners is an important task of Forensics.

There are two methods of engraving. In one, a manual engraver is used for softer surfaces. Engraved marks are made by removing the metal with the tool. The metal under the number/mark is not affected much. It may or may not help resuscitation. However, resuscitation is tried using appropriate etchant after polishing the surface.

In the other process, an electric engraver is used, especially on hard surfaces like that of stainless steel. In electrical engraving, the metal underneath is heated and gets fused. Erased marks can be resuscitated by applying appropriate etchant after polishing the surface.

If a mark is resuscitated, it must be recorded photographically and preserved by removing the etchant from the entity and covering the mark with transparent lacquer.

All parts (numbers) of marks do not pop up simultaneously, they appear at different intervals. A series of photographs are taken for a complete recording.

7.1.3.12 Prints

Prints from printing blocks are identified positively, as every printing block has its defects of omissions and commissions.

Numbers and dates printed from numbering and dating machines have, likewise, individualities that allow definite identifications.

> *In an interesting case, some lottery tickets, without carrying serial numbers were stolen from the printing press. When the prize of the lottery was declared, four claimants with the winning ticket number produced the tickets, to claim the prize. The authorities were perplexed to find so many tickets of the same number. They suspected that either the same number were printed on the ticket by machine failure or, at least three of the tickets were forged tickets.*
>
> *It was possible to identify the three forged tickets as their numbers were not printed on the official numbering machine. (CH)*

The identification of forged trademarks, designs, emblems, forged letterheads, identity cards, order forms, and currency notes is based on the identification of the defects or variation in the prints from the concerned block.

It is possible to link the forged prints to the offending blocks, if available.

7.1.3.13 Painted Marks

The printed registration number plate of a stolen vehicle is the first item which the thief changes. He puts up new plates, with a fictitious number or, he covers the real number on the original plate with a thick layer of paint and then puts a fictitious number on the painted plate.

In the latter case, careful removal of the new number and the new layer of paint can resuscitate the original number.

Some number plates consisted of letters and figures painted onto the metal plate. Obliteration normally consisted in painting over the surface with black or other paint and painting the false numbers. Similarly, some floral and ornamental designs, registration numbers, and some other identifying features all originally made on the painted motor vehicle surface are obliterated with new designs and numbers.

Resuscitation process of original mark/number involves the following steps:

1) The suspected obliterated surface is photographed first, *in situ.*
2) It is examined visually with varied illuminations, especially using acute oblique light. The obliterated marks may be visible sometimes.
3) The fresh paint of the number/plate is removed with chloroform, dioxin or some suitable mixture of solvents. The solvent used is tested before use.
4) The suspect painted surface is swabbed with the chosen solvent until the top layer paint loosens. It is swabbed away carefully with the cotton wool swab.
5) The obliterated marks appear at intervals. They are photographed and described. Each appeared number is photographed as soon as it appears.
6) X-ray shadowgraph sometime reveals the mark especially when underlying paint layer contains heavy elements, such as lead, while the top paint is free from such elements. Shadowgraphs should be tried.
7) In the case of the number-plates where original stuck number is removed/replaced, specular reflection may reveal the mark/number. An even light on the plate is thrown from an angle, and the plate is photographed from above. The brightly polished areas reflect the specular light. The marks appear black on a light background.
8) The plate is exposed to ultraviolet rays. The fluorescent images are photographed, and the mark/number is figured out from the image.

7.1.3.14 Broken or Severed Parts

Broken and severed part of an article(s) is sometimes found at the scene. The other part is recovered from the suspect, his vehicle or his house/office. If it is proved that, they originally formed part of the same whole; the "hand-in-glove" findings provide a definite proof of the suspect being at the crime scene.

The variety of broken or severed parts of evidentiary articles is limitless. Examples are: a broken bone, a nail, a tooth or a piece of skin, a tool, a glass, a wooden piece, a leaf, a cloth, an ornament, machinery, a twine, a board, a pipe, a stolen wire, a plastic hose, a paper sheet, a page or pages from a book or magazine or a newspaper. They have, at one time or the other, linked the criminal with the crime. However, one comes across the evidence only rarely.

> *A few years ago, the remnant of a button, with the central portion missing, was found at the scene. The missing portion was found firmly held by the threads of the stitches to the shirt of the accused. The two parts gave a hand and glove fit. The mechanical fit placed the criminal at the scene.*
>
> *The major part of the button had come off and fallen at the scene during the scuffle at the crime scene. (CH)*

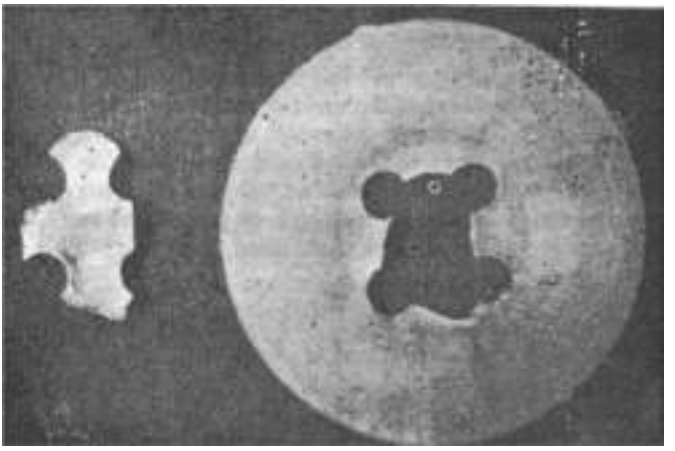

Fig. 7.5 **Fig. 7.6**

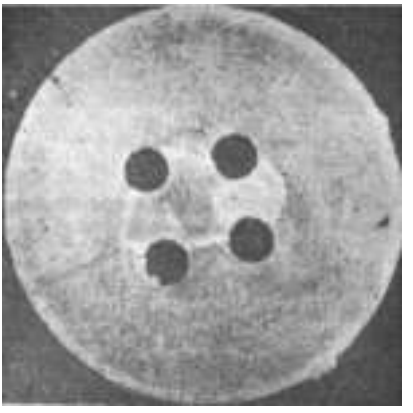

Fig. 7.7

A piece of button (Fig. 7.5) left with the shirt and another piece (Fig. 7.6) fell at the scene. mechanical fit (Fig. 7.7) of the two established the presence of the wearer, the culprit, at the scene

In cable/copper wire thefts the culprit sometimes changes the ends of the severed or broken parts intentionally or it may get mutilated otherwise. The severed ends can still be connected. The outer surfaces often carry striations; their presence and continuity links the two pieces.

The scratches may be natural or due to manufacturing defects.

A fingernail carries natural striations. A piece of finger nail can be identified in respect of the finger from which it has come even after years.

> *In one draw of a state lottery, nobody claimed the second prize at first. Later a ticket torn into many pieces was produced for the prize. The number of the ticket was on two pieces. It was necessary to find out if the pieces bearing the number came from one and the same ticket or not.*
>
> *The torn edges of the pieces did not give any definite indication. The background (security) printing, on examination revealed a gap of space of sixteen letters in the printed writing, instead of continuation.*
>
> *The two pieces bearing the number had obviously come from different tickets. (CH)*

Many other cases, involving mechanical were examined in the laboratory, including the following:

1. *Broken glass piece on a vehicle in a hit and run case was identified to the victim vehicle through mechanical fit of the glass piece. (CH)*
2. *A piece of cloth left in the barbed wire at the scene formed part of the shirt of the suspect from which, it had torn off. (CH)*
3. *A piece of paper, used as wad in a muzzleloader, found at the crime, was from a newspaper. The corresponding remnant piece was recovered from the house of the suspect. (CH)*

7.1.3.15 Contact Marks

Articles which are joined together by glue, nails or rivets exchange contact marks. If they are detached, changed or stolen, they can be interlinked through the contact marks exchanged by the two entities. A stolen tyre or a detached registration number plate of a vehicle or an ornamental piece from a vehicle, fallen off in an accident, can be identified in respect of the vehicle.

1. In a case of murder, the culprit speared his victim to death. In the process, the metallic spearhead struck in the body. The bamboo stick to which it was attached, came off. The culprit ran away with the stick.

Later, the extracted spearhead and the stick were sent to the laboratory.

The stick was attached to the spear head through two nails before they came off. The conical surface of the stick bore characteristic scratches from the two nail holes on the spearhead. A wax cast of the inner surface of the spearhead was prepared and taken out. It bore scratches from the nail holes. The examination/comparison of the marks on the wax cast and conical portion of the stick indicated the common source of the marks, linking the stick with the spearhead and identifying the spearman as the killer. (CH)

2. In a hit and run case, the investigating officer recovered some paint flakes from the scene of occurrence. When the suspected vehicle was recovered, it was possible to fit one of the paints flakes on the vehicle in spite of the fact that an attempt had been made to cover the spot with fresh paint. (CH)

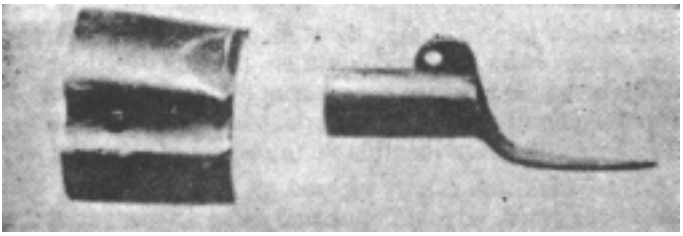

Fig. 7.8

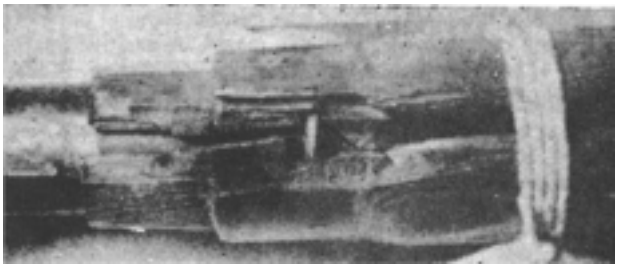

Fig. 7.9

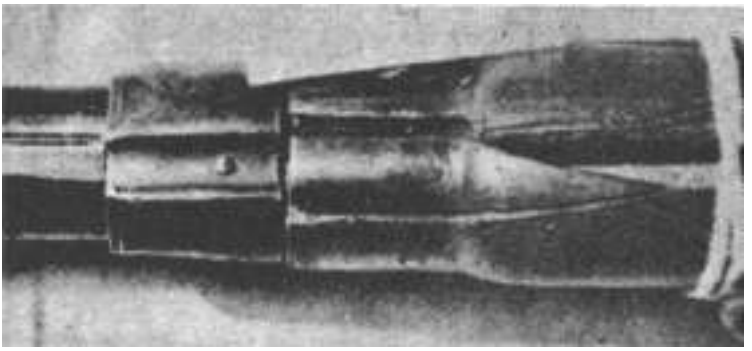

Fig. 7.10

Parts (Figs. 7.8 and 7.9) of a broken gun left at the scene fitted snugly to give the complete (Fig. 7.10) gun. the parts linked the scene with the suspect

7.1.3.16 Extraneous Material

The tools carry dust particles, paint, polish, and fragments of metals and wood from the place of contact. Similarly, if the tool is originally dirty, it may deposit the dirt at the place of contact. This type of evidence should be common. With modern scientific instruments, it is possible to evaluate the traces quite accurately. The evidence, therefore, should be searched, collected got evaluated used in the justice delivery system.

Fig. 7.11

Some common tools of the criminal

7.2 IMPORTANCE

The tool marks have great evidentiary value in criminal justice system:

7.2.1 Frequency

A criminal often uses some tools in the commission of a crime. For example:

1. If he is prying open a window, he uses a crowbar or a screwdriver,
2. If he is opening a lock, he uses a ghost key, a master key or a cutter,
3. If he is felling a tree, he uses an axe or a saw,
4. If he enters a house after cutting the bolt, he uses a hacksaw blade, and
5. If he steals copper wire or cable, he uses wire cutters,

The occurrence of tool marks is almost universal in all types of crimes.

7.2.2 Permanency

A tool is made of hard metal. The surface on which it leaves marks is ordinarily, made of softer material. There is minimal damage to the tool in the process. If the tool is not extensively used or misused and if the same is properly maintained, the marks are reproducible almost indefinitely. The permanency/quasi permanency can help to link the criminal with the crime even after a long time, through the tool recovered from the criminal and the tool marks collected earlier from the scene.

7.2.3 Individuality

The tool marks like fingerprints, foot and footwear marks and marks on bullets and cartridges are unique. No two tools, even made one after the other, in the same factory would create alike marks. They, therefore, establish a definite connection between the crime and the criminal. For example, a piece of wire is stolen (by cutting). The cut end left at the scene is sent to the laboratory along with the tool recovered from the suspect. The wire is found to have been cut with the recovered tool. The wire theft is pinned to suspect. This is so because no two tools even of the same make and batch made one after the other will have identical functional surfaces and leave identical marks on the surface cut, grazed or scratched by them.

7.2.4 Linkage

A culprit usually uses the same set of tools in the commission of the same type of crimes. If the tool marks from the various crimes are compared *inter se.* If they are found identical, they inter-link crimes.

7.2.5 Reconstruction

Careful study of the nature, position, direction and number of tool marks help in the reconstruction of a crime and thus it is possible to verify the prosecution or defence version of the crime.

> *In a case of murder, the accused claimed that it was an accidental self-killing. His version was that the victim attacked him with a sword. He threatened the victim with a gun. The victim in the meanwhile gave a sword blow, which he took on the barrel of the gun. It went off and killed the victim.*
>
> *The gun had a cut mark on its barrel and the story appeared to be correct. The action was enacted in the laboratory with the alleged gun and the sword. The gun was cocked and held in the firing position. A second person gave a number of sword blows with full force. However, the gun did not go off.*

When the gun was examined, no additional cut mark was observed on the barrel. Interestingly, on the other hand, the sword's sharp edge folded at the places where it came in contact with the gun barrel. It was crystal clear that the sword had not caused the cut mark on the gun or caused its firing.

The accused was confronted with the evidence. He confessed that he had created the mark with a Kukri (Khukuri). It was possible to get the corresponding cut when the test was carried out with the Khukuri.

The accused was prosecuted for murder. (CH)

7.3 LOCATION

The location of tool marks depends upon the nature of the crime. If earth or masonry work has been dug out, spades and shovel are the main tools. They leave marks on earth and masonry work. If the trees have been felled, axe marks are found on stumps of the trees. If planned planks had been stolen, tool marks connect the planks with the original source. If a house has been broken open, the tool marks are found at the point of entry (window, door, ventilator, wall or roof), on the locks, safe doors or on the cupboards. They may also leave on wall, furniture and door if the tool happens to touch them in a glancing blow.

If telephone, telegraphic or electric wires or cables are stolen, the cut ends of wires at the scene carry marks of the cutting instruments. The cut end may even give a 'hand-in-glove' fit with its counterpart recovered from the suspect.

Rubber or plastic cables and hoses do not retain identifiable tool marks. They cannot be identified in respect of the tools in most of the cases. The type of cutter used can be indicated sometimes. The analysis of rubber material may prove useful.

When the criminal enters the premises after breaking a glass window, the clothes of the accused are likely to carry glass fragments. The chips may permit the identification of the glass recovered from the site through mechanical fit or by comparing trace elemental profiles.

In hit and run cases, the culprit's vehicle may carry glass fragments, broken parts of the machinery or paint chips from the victim's vehicle, or, *vice versa.* The fragments or broken parts may connect the run-away vehicle through a mechanical fit with the corresponding part of the victim's or culprit's vehicle, as the case may be.

If a thief has removed a headlamp or other parts from a vehicle, the two parts carry contact marks. The patterns of contact marks connect the thief with the theft.

Tool marks are found on all types of surfaces and materials, wood, metal, stone, masonry, paint, earth, paper, cloth, sealing wax, plastics and leather. In fact, a surface coming in contact with pressure with a tool is likely to pick up its marks.

The tool marks are ordinarily visible as such. However, scratches in wood, paint and the like may need oblique light and darkness. The magnifying lens helps.

Iron pieces and fragments are conveniently located from the debris with the help of magnets. They may form part(s) of the tools used by the culprit.

Specific indentations or scratch patterns, imprinted by the victim or his vehicle on the offending vehicle, may provide irrefutable evidence of the violent contract.

In a hit and run road accident, a speeding car hit a cyclist from behind. The car crushed the fallen victim. The police apprehended the motorist soon after. They examined the impact marks on his vehicle. They found numerous indentation marks, which matched with the various damaged parts of the cycle. The two sets fitted with each other like a hand and gloves fit. The culprit was convicted on the evidence. (CH)

7.4 COLLECTION

7.4.1 Articles

Whenever possible, the original articles bearing the questioned tool marks are collected. Before removal, however, it is ensured that the position of the article with respect to its surroundings is properly established through description, photographs and sketches. Three photographs indicating the position of the article, the position of the mark on the article and the details of the mark are taken. The last photograph may have to be a macro photograph taken with artificial light.

An identification chit containing the case reference and the initials of the investigating officer and the photographer is placed before the photographs are taken, whenever possible.

When the article (of wood, metal and masonry work) is too big for convenient handling, the mark-bearing portion is cut, separated, sealed and sent in the usual way.

All articles bearing tool marks are collected. It is not desirable to pick and choose. Similarly, all suspected likely tools should be collected. The police should not use the collected tools to prepare test marks. The expert prepares test marks himself.

7.4.2 Casts

Sometimes it is not possible to collect the article or its mark-bearing part. In such cases, casts of the tool marks are prepared and collected. Some important materials and techniques to cast tool marks are:

7.4.2.1 Plasticine

Plasticine is available in most of the places and the casts with the same are easy to make. But they are not good. They do not pick up fine details and are easily deformed. They are prepared only when they are not required for permanent record or when the area bearing the marks is small.

A lump of plasticine is pressed in between two wet glass plates to give it smooth surfaces. The slightly moistened smooth area is pressed against the mark. The plasticine picks up the details. The moisture prevents sticking of the plasticine to the surface.

7.4.2.2 Dental Mass

Dental mass (like Kerr's dental mass) is available with a dental surgeon or a chemist selling dental materials. It can pick up fine details and record the marks permanently.

The material is kneaded under hot water and when it is soft and uniform in texture, it is pressed between two glass plates to give smooth surfaces. The material, while still warm and pliable is pressed against the tool marks and left at the site for some time. It picks up the marks. On cooling, it becomes hard and hence permanent record is thus obtained.

7.4.2.3 Adhesive Tape

Adhesive tape used to lift fingerprints can be used to lift shallow tool marks. It does not give good results in deep scrapes and indentations.

7.4.2.4 Latex and Plastic Solutions

Latex is rubber juice and is useful to collect tool marks. It is a good material for scrape marks but it is not so good for indentations especially deep ones, as, due to stretching, the dimensions of the lifted marks change.

The material is poured over the surface bearing marks. It is then allowed to dry for about six hours. The thin film or sheet formed is peeled off.

Plastic solutions (for example, cellulose acetate solution) are equally useful to lift the marks and are processed in a similar way.

Thermoplastic powders of low melting point and of light colour are also used. The molten material is poured over the marks. On solidification, it is picked up. It carries the marks.

7.4.2.5 Wood's Metal

Wood's metal[1] is an alloy which melts at a low temperature (<100° C). It is used to cast indentations with appreciable depth on metal or other surfaces.

The alloy is melted and poured into the mark. It solidifies on cooling and picks the details from the mark.

7.4.2.6 Plaster of Paris[2]

Plaster of Paris is useful when the dimensions of the tool marks are appreciable. The material is not so good to pick up fine details.

Plaster of Paris of the highest quality available should be used.

7.4.2.7 Tracing

Tool marks can be traced on a tracing paper/transparent plastic sheet/glass sheet. However, it is not recommended. The quality of the trace is highly subjective. It depends on the observation power/artistic skill of the person tracing the mark. Easy availability of the facility of photography has pushed out tracing almost completely.

7.4.2.8 Cellulose acetate casts

Cellulose acetate is useful material to lift shallow marks on a variety of surfaces, including wood, floors, and stones. Its solution in acetone is sprayed on the mark until the skin acquires a reasonable thickness (~ 1.5 to 2 mm). The nozzle is kept upward so that the solution falls on the mark with gravitational force only. Acetone evaporates in a short time. The cast is lifted. The marks thereon are evaluated.

Cellulose casts shrink. They should not be kept for long periods.

7.4.2.9 Silicone casts

Silicones are synthetic elastomers used mainly to obtain casts of many types of marks including tool marks. The silicone elastomers having plasticity, low viscosity, flexibility and elasticity are ideal materials for casting.

The silicone casts have the following advantages:

1. Silicone polymers are easy to manipulate.
2. The process is fast and safe.
3. They pick up fine details/margin details well.
4. They are amenable to pick up marks even from spaces that are difficult to reach.

---

1. It is an alloy of Bismuth (4 parts), lead (2 parts), tin (1 part) and Cadmium (1 part).
2. Plaster of Paris is partly hydrated calcium sulphate $(CaSO_4)_2$ 1/2 H_2O.

5. They cast are free from defects: deformation, air bubbles, shrinkage.
6. The life of the cast is long. They remain dimensionally stable for a long time.
7. They are strong and resist tearing.
8. They become rigid finally, without any shrinkage.
9. Rigidity confers stability to the cast.

The silicones being used are:

1. Polyvinyl Siloxane.
2. Silicone rubber.
3. Polyurethane elastomers.

In India, silicones are not used to cast tool marks to any extent, probably due to their prohibitive cost.

7.4.3 Packing

The packing of the evidence should ensure safety against breakage, contamination and loss. Whenever possible the articles are placed in a cellophane envelope. The open ends are closed. The envelopes are packed with cotton wool or clean dry rag padding in a suitable container. The marks should not come in contact with the packing material.

If the climate is humid and hot, a tool or the marks on iron and steel articles may rust. The mark may be damaged. A thin oil film applied over the surface prevents rusting. The oil film does not damage the marks and the extraneous deposit, if any, on the surface.

7.4.4 Standards

The investigator does not prepare the sample tool marks. The IO sends the tool along with the tool marks to the laboratory. The laboratory staff, using similar material to the one on which the crime tool marks were found at the site. If the material is hard, sample marks are prepared on softer material. In place of steel, iron, brass or copper, sheets of lead, zinc, tin or aluminium are used to prepare test marks.

The complete functional surface of the tool is used to obtain test marks from the suspect tool.

The angle at which the tool is applied has an important bearing on the clarity, number and dimensions of the scrape marks. The questioned mark is, therefore, carefully studied to get an idea of the angle at which the tool was applied. The sample marks are obtained at this angle.

It is often difficult to judge the correct angle of application. Therefore, a number of sample marks are obtained by changing the angle of application of the tool by about 5-10° for each sample. It is convenient to get the trial sample marks on plasticine or on the lead sheet. When the most suitable angle is discovered, the sample marks are obtained on the material corresponding to the original material or the one selected as a substitute.

7.4.5 Extraneous Materials

There are two types of traces collected/received:

1. Crime traces
2. Exemplar traces

7.4.5.1 Incriminating Traces

Incriminating traces may be found at different places. The collection technique varies somewhat:

1. When the traces of extraneous materials are found on the tool, the tool is placed in a cellophane envelope and then in a strong envelope or card box and sealed. The identification data along with the signature/date is put on the package, before dispatch.
2. When the traces of the material are found on the scratched surfaces the articles are placed in a cellophane envelope. If it is not possible to do so, the traces are collected on a paper with a fine and clean camel hairbrush, or by the techniques used to collect micro-traces. They are enclosed in chemist fold and the paper is packed and sealed as above.

7.4.5.2 Standards Sample Traces

It is difficult to collect the correct control sample of extraneous materials from scratched surfaces. Therefore, whenever possible, laboratory staff should help to collect the traces:

1) When the article bearing the suspected sample traces is transportable, send the article itself to the laboratory, observing usual formalities.
2) When the suspected surface/article cannot be transported to the laboratory the laboratory should be called to the scene to collect the sample traces.

The expert scratches the surface close to the area scratched by the tool of the criminal. He uses a similar clean tool. He takes care to scratch the surface to approximately the same depth as observed in the questioned scratch. The material scratched is collected/packed/sent to the laboratory, observing all the legal formalities.

The crime material deposited by a tool on the scratched surface may have come from the place where the tool was kept. A control sample of the extraneous material, in such cases, is collected from the tool, the toolbox or pockets of the culprit.

7.5 EVALUATION

7.5.1 Principle

"No two tools even of the same make, model or batch leave identical marks on the surfaces they worked on".

The principle is found sound both on an experimental and theoretical basis. it is impossible to get two exactly alike tools, even when they are manufactured consecutively in a rigidly controlled manufacturing process with the most sophisticated precision machines controlled through computers. Most of the tools used in the commission of crime are not manufactured under such controlled conditions. They frequently show a gross difference in addition to ever-present microscopic variations. Wear and tear and repair introduce additional nicks and protrusions, which give easily identifiable individuality to each tool.

If a tool is used extensively after the commission of a crime, especially on hard surfaces, the functional surface of the tool changes. The extent of change depends upon the extent of use or misuse. It may not be possible to identify the tool marks in respect of the tool if the working surface of the tool has drastically changed.

7.5.2 Techniques

The Forensic expert examines and compares tool marks visually, with the stereo/comparison microscopes and sometimes with Scanning Electron Microscope (SEM). In almost all cases, the marks are first photographed. In some cases, casts are prepared. Both photographs and casts, in addition to the examination/comparison of the original exhibits, are also used for examination and comparison However; the expert prefers the original marks for evaluations.

The expert uses varied techniques for the evaluations of the tool mark evidence according to the nature of the marks. The main modes include.

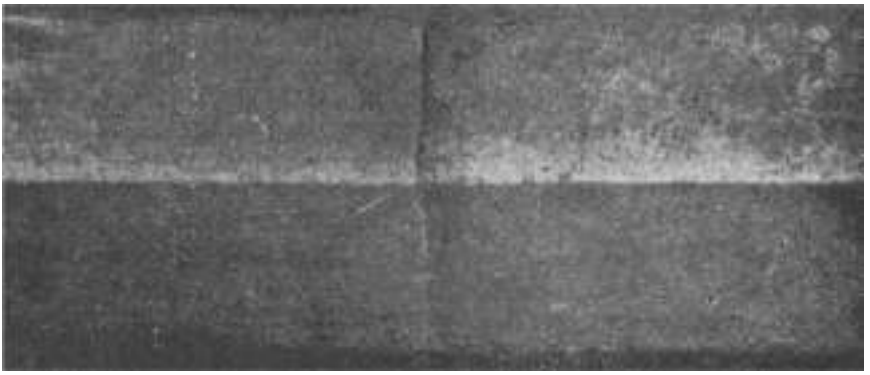

Fig. 7.12

A piece (C) of a broken sword found at the scene fitted with the sword (S) recovered from the suspect

7.5.2.1 Mechanical Fit

In cases, involving broken or severed parts of an article, a mechanical fit is tried first. Positive mechanical fit provides a conclusive proof that the parts originally formed part of the whole. The fit is illustration usually through photographs/sketches.

Sometimes the contour of the broken parts is not clear enough due to changes on the edges. In some cases, the article has appreciable projections and depressions at the cross-section. Their *inter se* fit provides the needed evidence.

There may be irregular marks on the original article. The cleavage sometimes divides the marks. Their continuations, from one part to the other, links the two parts. The irregularities are cast and compared *inter se*. The linkage is used where the mechanical fit cannot be done.

The broken or severed ends may carry microscopic details (striations), some deposit, some defect, logo, wear and tear marks on the outer surface of the severed parts. These marks may be adventitious, part of the manufacturing design, decorative patterns or accidental marks. They provide excellent mechanical fit evidence in some cases.

> *A few years ago, a train accident caused considerable loss of life and property. Sabotage was suspected. However, before the witch hunting was started, the laboratory staff was called in to examine scene of occurrence.*
>
> *A thorough search at the site gave an odd-looking twisted iron piece. It was found to form originally a fishplate nail. A detailed examination of the same, revealed:*

1. *The nail could be twisted only by strong mechanical force/pressure.*
2. *The flattening of the nail could take place only if a very heavy roller pressed it.*
3. *The twist suggested that the nail was held in a hole having strong edges when twisted.*

The pattern of events became clear. It seemed that the nail was placed in the space between the joint of the two rails. It made the speeding train to jump off the rail and caused the accident. Further check at site confirmed the thesis. The twisted nail had come from one of the joints.

Was the nail placed by the saboteurs? It was difficult to answer the question from the physical evidence alone. However, the accident had taken place near a town. The saboteur would have chosen a secluded place. It was, therefore, presumed that probably children placed the nail in the rails. Interrogation of the likely 'culprits' confirmed the same later. (CH)

7.5.2.2 Side by Side Match

Side by side match is the most common method for the examination and comparison of indentations, punch marks, prints from blocks, dating and numbering machines. In the examination and comparison, the main features scrutinised are dimensions, shapes, inter-distances design defects, wear and tear. If the features correspond, the match is established.

A transparent graph sheet placed over the photographs of the two marks, with the same magnification (or reduction) facilitates the examination and comparison.

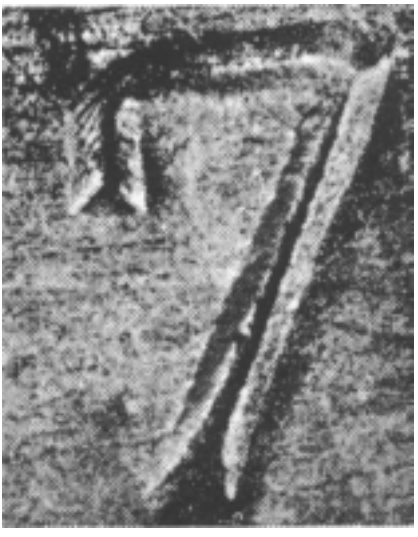

Fig. 7.13

Fig. 7.14

A punch used to change serial numbers of cars, recovered from a suspect, pinned the theft of a stolen car to the suspect. Digit 7 found on stolen car (Fig. 7.13) and the test prepared on a lead piece (Fig. 7.14) showed identity of common source

7.5.2.3 Composite Match

A composite photograph is convenient to prove the identity of the common source of indentations and prints. The photograph is taken through a comparison microscope. The images of half of each of the two, questioned and test, marks are adjusted at the dividing line. If the two halves complete the original mark without any appreciable divergence, the identity

of the common source is established. The technique is very useful and convincing. The marks should have sufficient dimensions and a number of nooks and corners to show a match or a divergence.

A few years ago, some members of the railway staff ganged up. One (or more) member of the gang would collect the used tickets at the destination station (Delhi) and return them to the station of origin to the member of the gang. He would re-stamp the ticket with new date, and sell them to the new buyers.

On investigation, dating dies (stamps) were recovered from the suspects. Comparison of the second (re-stamped date) on the resold tickets matched with the test dates prepared from the dies. (CH)

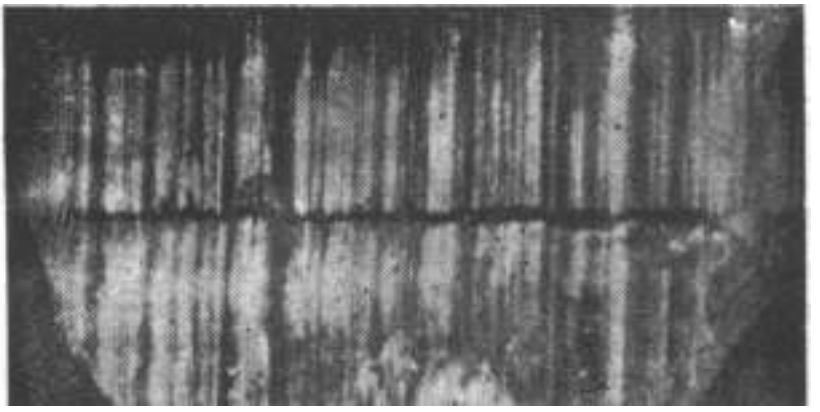

Fig. 7.15

A composite photograph of marks found on copper wire edge at the scene (C) with those obtained on test wire with the pliers (T) recovered from the suspect

7.5.2.4 Juxtapositioning Striations

As seen earlier, sliding/scraping tools leave striations (lines) marks on the scraped entity. The identity of the source (the tool) is established through the study and comparison of crime marks with the test marks, which the expert creates from the suspected tool. Stereomicroscope and comparison microscope is the equipment of choice for the study. The lines observed in the crime mark and test marks are brought at juxtaposition. If they show continuation across the two sets of marks, they show the same source of origin; that is, they have come from the same source. The technique is used invariably to examine and compare all types of striation marks.

It is worth noting that there will always be matching and non-matching lines in striation comparison. It is the preponderance of either which determine the match or non-match. In match, the number of continuing lines should be at least 70% and non-matching lines should not exceed 25%.

A comparison camera, in place of a comparison microscope, gives similar results. It does not offer any advantage over the comparison microscope. Rather, it is cumbersome and inefficient. It is not used in casework any longer.

7.5.2.5 Composite comparison of striations

Test and incriminating striation can also be compared without comparison microscope or comparison camera. Composite matching is done Two photographs, magnified or reduced the same extent, one each of the test and questioned marks are prepared. They are cut and pasted at the corresponding sites/positions. Preponderance of continuations/discontinuations of the striations indicates match/non-match (common/different source of the marks).

7.5.2.6 Stratigraphy

An instrument, stratigraph, has been developed to study the contour of striations on different objects. A delicate probe moves over the surface being studied. The changes in depths and elevations are accentuated and recorded on graph paper separately for the questioned and the test marks. The comparison of the graphs indicates the identity or non-identity of the common source.

The instrument does not offer any advantage over the comparison microscope. It is, therefore, of theoretical interest only.

7.5.2.7 Superimposition

Superimposition techniques can be used for indentation, scrape, punch and print marks. However, it is used mostly for indentation and punch marks. Two techniques are known:

1. In photographic superimposition a photographic print is prepared (say from the crime mark), and transparency from the test mark. The photograph and the transparency have the same magnifications or reductions, to get corresponding dimensions. The transparency is placed over the photograph. If the Various landmarks superimpose in the two, it matches, indicative of a common source of origin.
2. In the second technique, test marks are taken on an adhesive tape of appropriate size. The created marks are covered with a transparent plastic sheet. The print is now like transparency. The test mark print is placed over the crime mark, overlapping of the corresponding marks *inter se* shows match.

If necessary, the contrast is increased by smearing the tool with suitable fingerprint powder.

7.5.3 Sufficient Evidence

What is sufficient evidence in tool marks to declare the identity of the common source? It is a difficult question to answer and no generalisation is possible because the nature of marks varies from tool to tool. The experience of an expert is an important guide in this respect. In indentations, even a single characteristic formation may be sufficient. In scrape marks, one should be careful against being misled by an accidental match of a few lines. There should be no appreciable divergences and about a dozen lines should show a continuation in the test and crime exhibits when placed in juxtaposition. Fine striations are more trustworthy/valuable than the coarser lines.

> *In a blind murder case, the dead body of a young girl was found in a graveyard. The only evidence she carried on her person was a characteristic bite mark on her breast. The police investigations showed that she did not belong to the area and nobody has seen her in those parts. On logical considerations, the police believed that the girl had come to the place with a boy of a nearby college). He could be the likely killer.*
>
> *The dental casts were obtained from all the boys (over 400) of the college. Most of them could be eliminated easily. About half a score dental casts were ultimately left. A galaxy of dentists examined the mark and the cast and after due deliberations, they identified the cast of the teeth which had caused the bite mark. The suspect was given death sentence on the sole evidence of bite mark. (CH)*

The dimensions and clarity of a mark depend upon the angle, force and the direction of the application of the tool. The presence or absence of certain marks, both in the crime and the test exhibits, is often observed, it should not be mistaken for non-identity.

Contour match offers a different problem in elastic materials. The broken or severed edges, in the material, are often deformed in the process. The pieces do not show hand and glove fit. The manufacturing defects and wear and tear marks on the two parts should be searched for additional evidence. Comparison of the disputed and the specimen materials' elemental profiles also help in many cases.

In glass fragments, stone pieces and other hard substances, mechanically fit even through one millimetre is sufficient to constitute the identity of the common source.

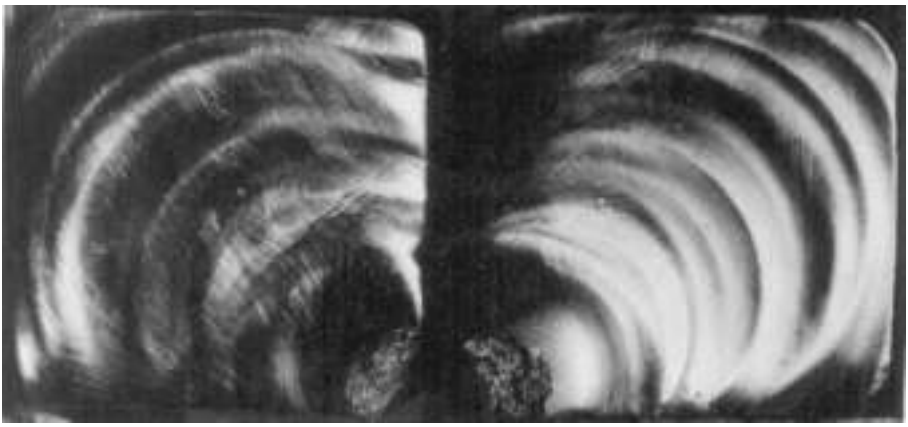

Fig. 7.16
The Two Iron Bars Cut with a Thread; One by a Jailbird, Other by Expert

APPENDIX I

Obliterated/Erased/Mutilated Marks

1. Methods to Remove Identification Marks

1) **Filing or grinding**

The original number is removed by grinding the number bearing surface with a power grinder. Filing is also used but it is inefficient and time consuming.

Usually a new number is stamped/engraved at the site of the old number.

2) **Peening**

Here the number bearing surface is pounded with the peen hammer (or ordinary hammer) to mutilate the identifying number.

3) **Over stamping**

In this process, the desired new number is stamped over the old number one by one. The die of the digit 8 is used to change those digits that have curvatures in their formation. For example, digits "0", "6", "9" are covered so well that it is difficult to detect the forgery with

a casual look. Likewise die of Digit '4' cover digits "1" and "7", admirably. All the digits are changed to prevent suspicion.

4) **Substitution**

In substitution, the perpetrator cut the metal bearing the number and weld another metallic piece bearing new identity number and hide the deed with paint. This has been observed in some stolen vehicles where chassis numbers of the vehicle were changed.

5) **Drilling-**

A number of holes are drilled with a drill around the original marks and the piece bearing the mark is knocked off (removed). A metallic piece bearing the new mark is welded at the site.

2. Resuscitation

Whenever a thief steals a metallic object for sale/personal use, the first thing he does is to erase the identifying marks in the form of serial number, logo and name of manufacturer. For example, if the stolen object is a vehicle he tries to change the original serial numbers on the engine and chassis by filing, hammering or chiselling. He changes the original digits and designs. He also changes the registration number on the plate. Sometimes instead of using a fresh registration number plate, the fictitious number is painted over the previous numbers after covering the first with a thick coat of paint. It is possible to detect the change and decipher the identifying marks, through physical and chemical processes including the following:

1. Etching,
2. Radiography,
3. Magnetic resuscitation

   The number bearing iron/steal object is placed in a magnetic field and iron filings, suspended in a liquid base, are spread over the surface. The digits and letters are formed by the arrangement of the iron filings on the edges of the punched writings.
4. Electrolytic dissolution or deposition

Etchant Resuscitation

It is a method of choice to resuscitate punched/engraved marks in India. The resuscitation of punched marks is based upon the principle that the concentration of the metal molecules underneath the marks is increased when it is punched/engraved. This increased concentration of metal reacts with the etchant at different rate than that of the un-punched surface. This differential reaction rate reveals the marks. It is recorded immediately photographically as in some cases it is transient.

The process is simple and does not require any special equipment. However, it is tedious, time consuming, somewhat hazardous and requires care, experience, patience and vigilance.

The process involves the following steps:

1. The site is photographed *in situ* to fix it position and identity.
2. The surface is cleaned to remove all dirt/paint/oil

3. The surface is polished. Emery sand papers of various grades are used. It is photographed. Enlarged photographs of the engraved marks after polishing, cleaning and removing paint and dirt may reveal the original number in some cases.
4. In some cases polishing reveals the part of the mark,
5. The etchants, relevant to the metal, are selected after testing. The surface of the same object, near to disputed mark bearing site is used for tests.

   Different etchants are used for different surface materials. In some cases, two etchants are used alternately. For example, on iron surface, Fries Reagent and 15% Nitric Acid are used alternately.
6. The polished surface is swabbed with the selected etchant repeatedly.

   The differential reaction of the etchant on the punched surface brings out the mark. Usually the mark appears in parts, most of the time. The part is photographed immediately as it can be fleeting mark only. It may vanish soon after. For example in the resuscitation of number on the chassis of a vehicle, only one/two digits may pop up at one time.

   The swabbing is continued until there is no likelihood of appearance of additional marks. The marks appear at intervals. They are photographed and recorded immediately.
7. The surface and the object is cleaned after resuscitation inputs to make it free from any chemical used in the process.
8. The revealed number is preserved on the site whenever possible, and
9. The site is oiled/lacquered to prevent rusting.

If the number is engraved, it may or may not be possible to resuscitate it. Chisel and hammer engraving may compress the metal somewhat and permit resuscitation.

If the engraving has been done with an electric engraver, melting of some metal at the site takes place. It changes the concentration of metal molecules at the site. Its differential reaction rate to etchants reveals the marks.

The registration number is painted on a plate. The thief often covers the number with a thick layer of fresh paint. He, now, paint the fictitious number thereon. The original number is easily resuscitated by simple solvent action. It removes the number and the new paint and the original number is revealed.

7.6 CASE LAW

7.6.1 Button Evidence[3]

That apart, the button which was recovered gives a direct clue to the presence of the accused at the time when the offence was committed. It is seen from Ex. p 6/A that the upper button on the cuff of the coat recovered from the accused was missing and the button recovered from the room where the deceased was murdered matches the button and supplies the missing one. The report of the forensic expert is that the button of the accused's coat establishes that it is the similar one. For this reason the accused had denied that the coat and the sweater belonged to him and the learned advocate on his behalf has urged in support of that plea that these were not recovered from the accused and the recovery memos were all fake and were written

3. *H.P. Administration v Om Prakash*, AIR 1972 SC 975 : (1972) 2 SCR 765 : 1972 Cr LJ 606.

subsequently. Accused in the statement under section 342 in answer to question 19, that he had signed the recovery memos dealing with the sweater, coat and blanket said that it was incorrect. He further said that he was made to sign three blank papers in the Thana and that he was filing a copy of the application in this connection while he was in the judicial lock up. Again in answer to question 35 whether he has anything else to say he stated categorically that on the 1 February 1967 he was taken to the Thana at 5 pm, on the 2nd February he was produced before the court from where a remand was taken and that on 7 February 1967 the S.H.O. obtained his signatures on three blank papers in respect of which he had sent an application after he was taken to the judicial lock up. This statement goes counter to the facts stated in the application of remand made to the magistrate on 2 February 1967 which was earlier extracted. A perusal of that remand application would show that these recoveries had already been made on the 1st and so there could be no question of his signatures being taken on the blank papers on the 7th for purposes of cooking up the recovery memos which according to the accused were not recovered on the 1st. The coat and the sweater were recovered from his room while the shoes and socks from his person as he was wearing them. There can be no doubt of the ownership being that of the accused.

7.6.2 Mechanical Fit[4]

Accused No. 3 in this case led the police party and the *panchas* to a place near a small temple of a deity. Accused No. 3 took out a Dharia from the hedge of thorns. The Dharia was attached. A *panchanama* was made. The Dharia which was attached had its blade broken. There were blood like stains on it. Article 13 was the Dharia produced in court. The blade which was found from the scene of offence near the dead body and the dharia which was attached matched. The High Court saw the two pieces matched completely at the broken edge and there was no doubt in coming to the correct conclusion that the broken piece of blade was broken from this particular Dharia and the remaining portion which was recovered according to the prosecution from the hedge was the other matching part of it.

7.6.3 Weapon used in commission of crime[5]

The learned counsel for the accused-appellant has contended that the recovery of the weapon used in the commission of the crime is not satisfactorily established. In the present facts, with regard to the death of the deceased, after the incident, the inquest *panchnama* was prepared and the dead body was sent to the Civil Hospital, Nanded for post mortem examination. The doctor's report indicates that it was a homicidal death. The blood-stained clothes of the deceased and also blood-stained "katti" was recovered at the instance of the appellant from his house in the presence of panchas under the memorandum *panchnama* which was in the presence of the witness. The same had been sent to the Regional Forensic Laboratory, and a report had been obtained. In that circumstance, when the weapon used for committing the offence had been recovered in the manner known to law and the appropriate reports were also obtained, the contention on behalf of the appellant that the recovery of the weapon is not believable cannot be accepted. When the accused-appellant as also the deceased were inside the house and in the circumstances death on the spot had occurred, the death in the manner as contended by prosecution and spoken to by witnesses is to be accepted. Further, the said witnesses were also chased by the appellant from the very spot where the incident occurred. That apart, the "katti" was recovered and the forensic report also supported the case of the prosecution.

8.1 IMPORTANCE

The abuse of firearms figures prominently in most of the heinous crimes like murders, dacoities, robberies, assassinations, mob violence and police encounters. The firearm evidence, therefore, is indispensable in handling such cases.

The linkage of firearm-criminal through fired ammunition is well established. Its evidential value is now on the same footing as the fingerprint evidence because the individuality of the gun's marks impressed on a fired cartridge or on a bullet is universally recognised. So much so that these marks are called thumbprint of the firearm.

The assertions of the expert that no two firearms even of the same make, model, batch and made one after the other leave identical marks on fired ammunition, are accepted like the assertions of the fingerprint experts that no two fingerprints from two different fingers even from the same person are alike. Accused persons were convicted and sentenced and the sentence was maintained even by the Apex court (Supreme Court) solely on firearm evidence.

It is, however, necessary to link the firearm with the culprit beyond a reasonable doubt. It is in addition to the proof that the firearm recovered from the culprit, fired the fatal cartridge/bullet recovered from the scene/body of the victim. Further, it has to be proved that the firearm was in the possession of the accused at the time when the crime was committed.

The firearm evidence helps the investigations in many ways. It helps to:

1. Ascertain whether the given incidence is a case of murder, accident, killing in self-defence or suicide.
2. Determine the sequence of events.
3. Verify versions.
4. Establish the number of shots, their directions and ranges and the number of firearms used in the incident.
5. Identify the shooter through GSR
6. Determine the time of the fire
7. Distinguish between real and fake incidences.

8.2 NATURE

Firearm is the best leveller of the weak and the strong

8.2.1 Firearms

A firearm is a device to hurl a projectile or projectiles. The force pushing the projectile(s) is from the expanding gases, created by the burning of propellant powder charge at a very high rate. In air rifles and pistols the projectiles are hurled by the expansion of compressed air.

According to Indian Arms Act, a firearm means arm of any description, designed, adapted to discharge a projectile or projectiles of any kind by the action of any explosive or other forms of energy and includes:

1. Artillery, hand grenades, riot pistols or weapons of any kind designed or adapted for the discharge of any noxious liquid, gas or other such things.
2. Accessories for any such firearm designed or adapted to diminish the noise or flash caused by the firing thereof.
3. Parts of and machinery for manufacturing firearms and cartridges, platforms and appliances for mounting, transporting and servicing artillery.

In forensics, usually small arms are encountered. They are defined as:

> *Small Arms are small calibre firearms, which can be easily hand-handled, carried and operated by a single person. They include handguns, (pistols and revolvers, machine pistol[2]) which are fired with one hand; shoulder arms, which are fired from the shoulder (shotguns, rifles, assault rifles, carbines, muskets) and sub-machine guns/ light machine guns fired from a stable pedestal. They may be single shot/semi-automatic/fully automatic firearms.*

2. They are pistol and machine gun combinations. They fire pistol ammunition, are automatic with magazine.

UNO has defined small firearms as:

> ***Small arms are, broadly speaking, weapons designed for individual use. They include, inter alia, revolvers and self-loading pistols, rifles and carbines, sub-machine guns, assault rifles and light machine guns.***

In India, commonly used firearms, in crimes, are:

1. Shotguns
2. Revolvers
3. Pistols
4. Rifles
5. Sub-machine guns
6. Machine guns
7. Muzzle Loaders
8. Improvised firearms[3]

Fig. 8.3
4 Barrel Pistol

There are numerous variants of firearms in each category.

The most commonly used weapons are 12 bore shotguns and improvised firearms, in India.

8.2.2 Firearm Parts

A firearm has three main parts: barrel, action and stock.

8.2.2.1 Barrel

The barrel of firearm provides space for the expansion of gases. It has a chamber to house the cartridge in most of the firearms (revolvers excluded!). The chamber is on the back end of the

3. They are non-factory-made crude firearms, usually made by local blacksmiths, conforming to no specifications. Most of them are dangerous to the user.

barrel. In many firearms, there is a "leed" between the normal barrel bore and the chamber. Leed is gradual narrowing down the chamber bore from the chamber diameter to that of the barrel bore through a tapered hole.

Leed prevents tilting of the projectile during its journey from the chamber to the barrel.

There is no chamber in the barrel of a revolver. A revolving cylinder houses the cartridges instead. The name "revolver" of the firearm is perhaps after the revolving cylinder.

8.2.2.2 Action

The action consists of the mechanism for loading, firing, extraction and ejection of the cartridges, the magazine and the safety devices, if any. The arrangements for the location of the constituent parts vary in different firearms.

8.2.2.3 Stock

The stock of a firearm holds the other parts in position and provides support for firing purposes. In automatic and semi-automatic pistols, the stock also carries the magazine.

The parts, which imprint/impress identification marks on the fired ammunition, are:

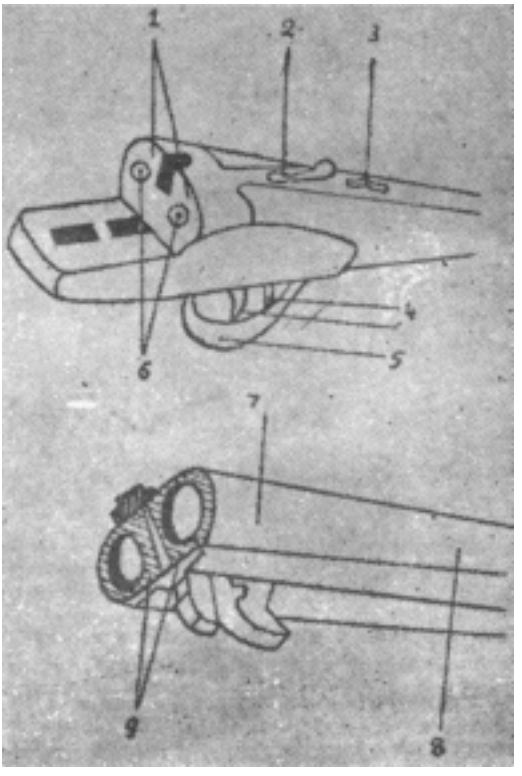

Fig. 8.4

Parts of a guns.
1. Breech Face 2. Breech Lever 3. Safety Catch 4. Triggers 5. Trigger Guard
6. Firing Pins 7. Chamber 8. Barrel 9. Extractor

8.2.2.4 Firing Pin or Striker

It is the part of the firearm, which, on pressing the trigger, moves forward and strikes the cartridge with force. It is located in the breechblock in shotguns, in the bolt heads (also known as breach block) of bolt-action rifles and in the moving breechblock in automatic and semi-automatic firearms. It forms part of the hammer in revolvers. It is the most important part for the identification of fired cartridges. The firing pin indentations are invariably present in all fired cartridges. The indentations alone permit the identification of the firearms in about 95% cases.

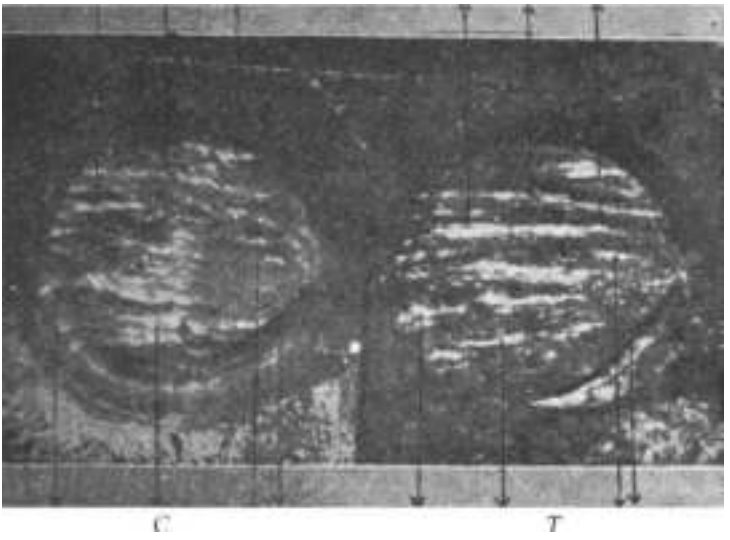

Fig. 8.5

Firing pin impressions (C and T) from the common source

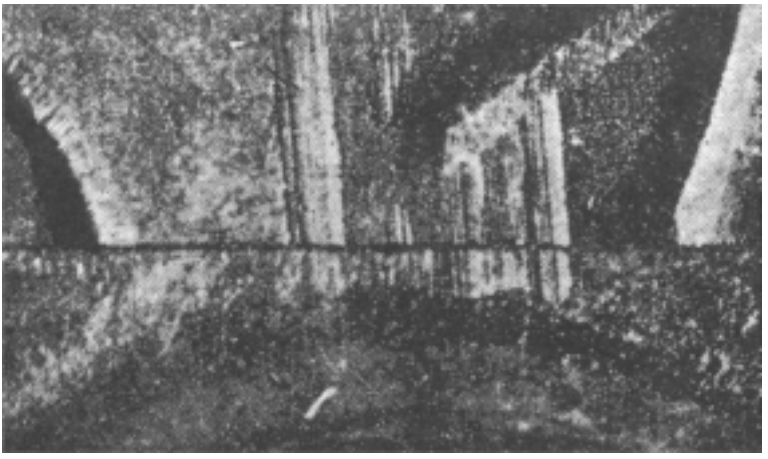

Fig. 8.6

Firing pin scrape marks indicating the common source

8.2.2.5 Breech Face

The area surrounding the firing pin hole is the breech face. It seals the barrel from the chamber side and holds the cartridge case when the recoil pushes it back due to on firing. It comes in close contact with the base of the cartridge and the irregularities of its surface are imprinted on the cartridge.

The breech face is the second most important part of a firearm from the point of view of identification of a fired cartridge in respect of the firearm, which fired it. The marks are particularly important in cartridges developing high pressure. The cartridges fired from standard shotguns in most of the cases, do not carry sufficient breech face marks. On the other hand, rifles developing high pressures imprint conspicuous breech face marks.

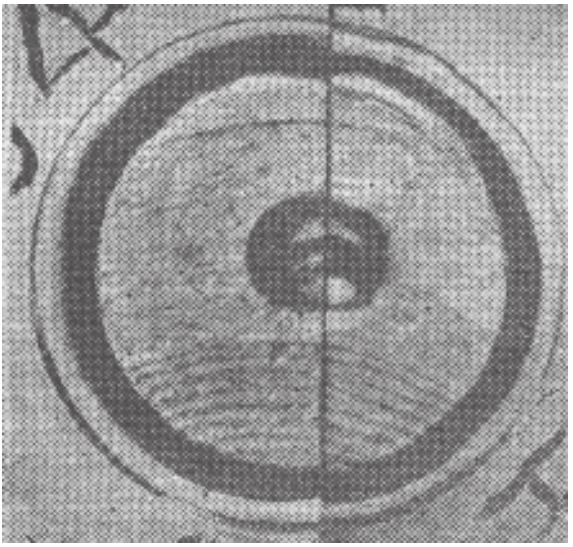

Fig. 8.7

Breech face marks, unusual pattern, sufficient to establish the common source

8.2.2.6 Chamber

The chamber surface of a firearm has microscopic imperfections. These irregularities on the surface usually do not mark the fired cartridges because the diameter of the chamber is somewhat larger than the diameter of the cartridge. The cartridge, therefore, does not come in close contact with the surface of the chamber even after expansion. Sometimes, there may be some abnormality or some extraneous material deposit in the chamber, which may reduce its effective diameter.

If a local blacksmith has made the firearm, He may not be aware of the required tolerance in the chamber it is not there. In such cases, the cartridge is held tightly in the chamber. On firing, the cartridge case expands and comes in close contact with the chamber surface and the chamber marks are imprinted on the cartridge. Chamber marks are found frequently on cartridges fired from improvised firearms.

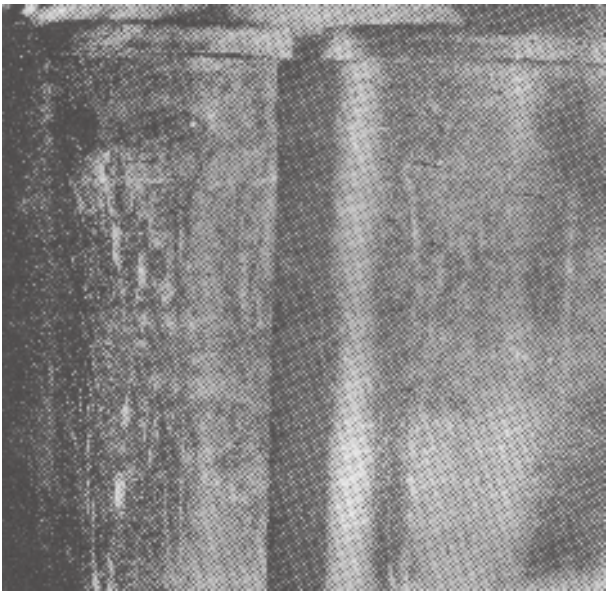

Fig. 8.8

Chamber marks, often unavailable, but in this case sufficient to establish the common source

8.2.2.7 Extractor and Ejector

Extractor and ejector of a firearm are of varied designs and forms. They come in contact or strike the casing of the cartridge fired through the firearm; or, in the extraction/ejection process. They imprint their surface irregularities on the shell. The marks are often insufficient for identification purposes. They are individualistic only in rare cases to allow independent identification of the firearms. However, they do corroborate the findings.

The marks provide useful class characteristics in "no gun" work to identify the type of firearm used to fire the given cartridge.

The marks also indicate the orientation of the cartridge in the chamber.

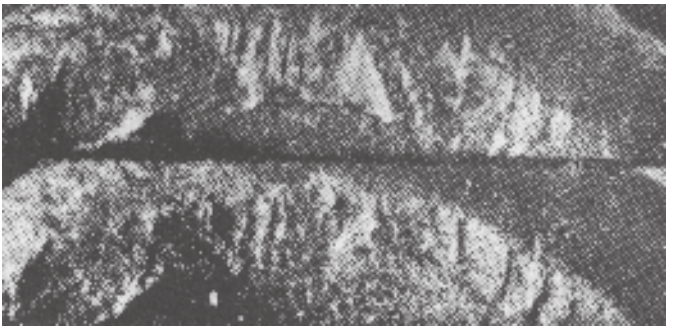

Fig. 8.9

Breech face marks, unusual pattern, sufficient to establish the common source

8.2.2.8 Barrels

The barrels of all firearms imprint marks on all fired projectiles, which fit tightly in the barrels. In rifled firearms, the marks are from the imperfections of the lands and the grooves, mostly from the lands of the barrels. Likewise, in smooth bore firearms the imperfections of the inner surface of the barrels create striation (line) marks on the projectiles. Balls, slugs and bullets fired from smooth bore firearms have been identified in respect of the used firearm in criminal cases from the striations, which the latter leaves on the former.

The bore of a barrel is also called calibre or gauge. It is measured in millimetres, in most parts of the world. In the United Kingdom and some Commonwealth countries it is measured in thousandths of an inch. In the Unites States of America, it is measured in hundredths of an inch.

The calibre of a firearm is usually nominal. Its exact measurements frequently differ from the nominal bore size. Thus, the diameter of the bore of .38 revolvers is about .334 inches only. The actual diameter of a bullet also differs from its nominal (designated) calibre.

8.2.2.9 Choked Barrels

When the diameter of a barrel of a shotgun is the same throughout the barrel bore, it is a true cylinder barrel. However, the bore of barrel of a shotgun is often reduced near the muzzle end of the barrel. That is, the diameter near the muzzle end is slightly less than the diameter of the bore of the rest of the barrel. Such barrels are called choked barrel. The choke is full, half, quarter or improved cylinder, if the diameter at the muzzle end is reduced by about one, half, one quarter and one-tenth of a millimetre, respectively.

The choke increases the effective range of a shotgun by increasing the concentration of pellets per unit area at the target. For example, for every hundred pellets fired, seventy pellets will fall in a circle of seventy-five centimetres at a range of thirty metres in a fully choked barrel. The number of pellets falling in an equal circle under similar conditions for a true cylindrical barrel is forty only.

8.2.2.10 Leed[4]

When a bullet comes out from the cartridge case (and chamber) and before it sets into the grooves, it slips over the leed and is imprinted with the slippage marks. They are often useless for identification purposes but the bullets, which fit loosely in the barrel and do not take up barrel marks may be identified, sometimes, in respect of the suspected firearm through the slippage marks left by the leed, by special techniques.

8.2.3 Classification

Firearms have been classified in many ways including the following:

1. Barrel bore characteristics classification
2. Functional mode
3. Calibre based classification
4. Loading mode
5. Handling Mode classification

8.2.3.1 Barrel Bore characteristics

Firearms bores are either smooth or rifled.

4. It is the tapered barrel part between the chamber and the normal barrel bore with progressively reduced diameter from that of the chamber to that of barrel bore.

8.2.3.1.1 Smooth Bore

The shotgun, the muzzle-loading gun, the musket, most of the improvised firearms and the signal pistols and cattle guns are the common smoothbore firearms. Here the barrels are smooth and cross section of the bore inside forms a circle at any point. Ordinarily, pellets and shots (small lead balls) are fired from smooth bore barrels. Single projectiles, like balls and slugs (ordinary or rifled) are also fired sometimes.

Shotguns with rifled barrels are known but they are rare. They have, in most of the cases, two shallow grooves. The grooves increase the range and accuracy of aim when ball charge is fired. "Paradox" shotguns are similar in performance. In these guns, a few inches of the barrel near the muzzle end are engraved with grooves.

A shotgun is a short-range firearm. It is used for hunting small game. It does not give a very accurate aim when a single projectile is fired. The necessity of accurate aim is obviated when a cartridge with a large number of pellets or shots is fired. The spread of shots covers increasingly larger areas with the increasing range due to dispersion of pellets or of the shots.

Shotguns are designated with reference to the size of their bore. If the diameter of the bore of a shotgun is equal to the diameter of a spherical lead ball weighing one-twelfth of a pound, the gun is called a 12-bore shotgun. If the ball equal in diameter to the diameter of the shotgun, weighs one-eighth of a pound, the gun is called an 8-bore gun and so on. When the bore diameter of a firearm is less than half an inch, the bore is designated in thousandths of an inch, *e.g.*, musket's bore is given in inches (0.410).

8.2.3.1.2 Rifled Bore

Rifled firearms have grooves and lands in their barrels. The grooves are canal like furrows cut out from the barrel in spirals, by giving a regulated twist to the cutter or to the barrel to get the groove in the required spiral shape. The number, angle of twist, direction, depth and width of the grooves vary with various manufacturers. Two to seven grooves are common though multi-micro-groove firearms (firearms with shallow and numerous grooves) are also in the market, though not common in India.

The raised portion between the two grooves is called a land. The number, direction, and twist of lands are the same as the corresponding of the grooves. The width may or may not be the same.

The lands (and sometimes grooves) scratch striations (lines-like linear markings) on the projectiles passing through the barrel. The width, depth, twist and direction of the lands and grooves on the projectile provide class characteristics of the firearm. The finer details of the striations in the grooves and lands give the individualising characteristics of the barrel.

Pistols, revolvers, sporting rifles, service rifles and machine guns are the important rifled firearms. They are quite popular with the criminals and commonly used in offences.

8.2.3.2 Function

Functionally, the firearms are divided into the following categories:

8.2.3.2.1 Single-Shot Firearms

Target pistols, some rifles and most of the shotguns are single shot firearms. The firearm has to be loaded for each firing. Double-barrelled shotguns are also of this class, though two shots can be fired without reloading, one from each barrel one after the other. Most of the improvised firearms fall in this category.

8.2.3.2.2 Repeaters

A firearm may be a repeater. The firearm has a magazine to house two or more cartridges. Extraction, ejection and reloading are done in a single manual operation. Some shotguns and most of the old bolt-action service rifles (.303 rifles!) belong to this, class.

Pump action shotgun also belong to this class.

8.2.3.2.3 Self-loaders

A firearm may be a self-loader (semi-automatic). When a self-loading firearm is fired, the fired cartridge case (empty shell) is ejected and a fresh cartridge from the magazine is loaded automatically. Thus, the firearm is ready to fire a second shot. The shooter has to just press the trigger. The process of extraction, ejection and reloading is repeated on second and subsequent fires until the magazine is empty. Semi-automatic pistols and modern service rifles belong to this class.

8.2.3.2.4 Automatics

An automatic firearm has all the qualities of a self-loader. In addition, after pressing the trigger for the first shot firing, the firearm goes on firing automatically as long as the trigger is kept pressed and the magazine is not exhausted. Some pistols (including machine pistols), sub-machine guns belong to this class. Many of them have a mechanism to change them from automatic to semi-automatic action.

8.2.3.2.5 Assault Rifles

Assault rifles have both automatic and semi-automatic actions. These rifles are being used extensively in the services all over the world. AK 47, AK 74 are world class assault rifles. They are famous (or notorious?) in our country because of their misuse by the terrorists. The Indian Government has also come up with INSAS 5.56.

8.2.3.3 Calibre-based Classification

Rifled firearms are often classified according to their calibre. Thus, we have 6.25 mm firearms, 7.65 mm firearms, 9 mm firearms and many other calibre-based firearms.

In smooth bore firearms, we have similar classification. Thus, we have 8-bore, 12-bore, 16-bore and the like shotguns

8.2.3.4 Loading Mode Classification

In loading mode classification, we have muzzle-loading, breech-loading or magazine-loading firearms. The terms are self-explanatory.

8.2.3.5 Handling Mode

Handling mode classification classifies firearms in the following categories:

- Handguns
- Shoulder arms
- Light machine gun small arms. They are comparatively heavy firearms and are fired from a pedestal (platform); or, by two or more persons jointly.

8.3 AMMUNITION

8.3.1 Legal Definition

According to the Indian Arms Act, 1959, under section 2,(b), "Ammunition" means:

Ammunition for any firearm, and includes:

1. *rockets, bombs, grenades, shells* [5] *[and other like missiles,]*
2. *articles designed for torpedo service and submarine mining,*
3. *other articles containing, or designed or adapted to contain, explosive, fulminating or fissionable material or noxious liquid, gas or other such thing, whether capable of use with firearms or not,*
4. *charges for firearms and accessories for such charges,*
5. *fuses and friction tubes.*
6. *parts of, and machinery for manufacturing, ammunition, and*
7. *such ingredients of ammunition as the Central Government may, by notification in the Official Gazette, specify in this behalf,*

The Act, thus, includes a variety of articles in its definition of ammunition. But in forensic ballistics, ammunition means the cartridges, shells, propellants, projectiles, wads and the initiation system [the metallic cup (percussion cap), the anvil inside, the initiating explosive and other chemicals to ensure smooth, efficient and safe initiation] commonly used in small arms.

The important parts of a cartridge are; the powder charge, the projectile charge, the primer, the cap composition and the shell. The shell holds the propellant, the projectile charge and the cap composition. The charge is separated from projectile charge with wads, especially in shotgun ammunition.

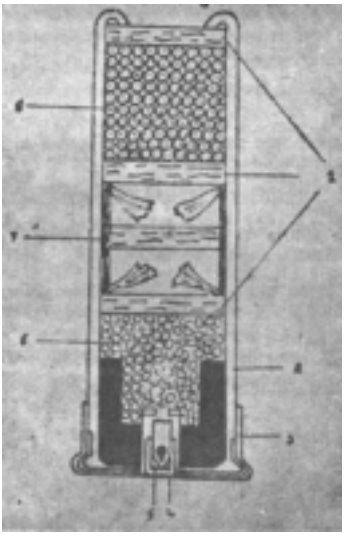

Fig. 8.10

Parts of a 12 bore Cartridge.

1. Wads 2. Case 3. Metallic Base 4. Percussion Cap 5.
Primer Touching the Anvil 6. Powder Charge 7. Cushion Wad 8. Pellets

5. Subs. by Act 42 of 1988, section 2, for "and other like missiles" (w.e.f. 27-5-1988).

An innovation in the manufacture of cartridges is a caseless cartridge. An RDX based powder charge, in the form of a mould is attached to the bullet. The cartridge is fired from specially made firearms. On firing, the mould (made from explosive) is the propellant for the cartridge. It burns and produces gases which propel the projectile. Practically nothing is left in the chamber after firing.

8.3.2 Classification

The various constituents/items, which form ammunition are briefly discussed here.

8.3.2.1 Gunpowder

The gunpowder (also called black powder) consists of potassium nitrate, sulphur and charcoal roughly in the proportions of 75:15:10. The powder is not suitable for high velocity ammunition, as large amounts of the powder are required to get high velocity. Besides, it gives irregular ballistics and leaves a considerable amount of solid residue, which tends to foul the barrel. If large quantities of black powders are used in a cartridge, they create excessive recoil.

Most of the countries do not use black powder as the propellant. It is still used in India to refill fired shotgun shells and in muzzleloaders.

In a murder trial, the defence counsel cashed upon the ignorance of a doctor who appeared as a witness. The doctor in cross-examination stated that he observes which he believed had come from a cartridge containing black powder and not from a cartridge containing smokeless powder. He believed that smokeless powder does not cause blackening.

The defence counsel later ascertained that the cartridge allegedly fired by the culprit and found at the scene of occurrence contained smokeless powder.

The defence counsel argued that the gunfire injuries on the person of the victim was caused by a cartridge containing black powder as propellant and the cartridge allegedly fired by the accused contained smokeless powder. He, therefore, could not be the murderer. He got an acquittal for the murder from the trial judge.

The prosecution filed an appeal in the High Court against the acquittal. The high court requisitioned the services of the author. He test-fired similar cartridges recovered from the accused in the presence of counsels from both the parties. Test firing revealed that blackening is caused with cartridges containing smokeless powder as the propellant.

On the request of the defence counsel the colour of the target was made to correspond roughly with the colour of the deceased (brown paper was used) and it was covered with the clothes of the deceased in some test shots. Blackening was still observes observed under these conditions, from the alleged distance.

The firearm involved in the crime and cartridges recovered from the accused (similar to those involved in the crime) were used for test purposes. (CH)

8.3.2.2 Smokeless Powder

Smokeless powder is now almost the universal propellant for small arms ammunition. The active constituents of the powder are nitro-glycerine and nitrocellulose. When only one active constituent (nitrocellulose) is used as a propellant, the powder is called single-base powder.

No single base propellant is made from nitro-glycerine because it develops a high temperature, which "washes" the barrel of the firearm. Besides, its high power tends to shatter the device in which it explodes.

When the two explosives are used together, the propellant is called double-base powder. The active constituents are mixed in such proportions with other substances (commonly

barium nitrate, potassium dichromate, Vaseline and the like) as to achieve the best ballistics from the propellant.

The powder is made in various shapes and sizes to get required ballistics. It is commonly used as flakes, tubes or rods. It may be porous or non-porous. The rate of burning is more for porous/tube forms of the propellant.[6]

The propellants with the increasing rate of burning are called progressive powders, those with the decreasing rate of burning are called degressive propellants.

The exact shape, size and chemical composition of propellants vary with different manufacturers. Therefore, their differentiation and identifications are possible.

8.3.2.3 Projectiles

The projectiles have different shapes, sizes, weights and constructions. Pellets, shots and balls are used in shotgun and musket ammunition. The size and number of the pellets and shots vary with different types of cartridges. The nomenclature of the cartridges with respect to the sizes of pellets and shots is the same in India as in the United Kingdom and other Commonwealth countries. It is different in the United States of America and other countries.

Table 8.1

Projectile charge of shotgun cartridges

Number	No. of projectiles per ounce[7]	Projectile's diameter mm.	Projectile's weight in g
LG	6	9.14	4.54
SG	8	8.43	3.54
Special SG	11	7.57	2.58
SSG	15	6.83	1.89
AAA	35	5.16	0.81
BB	70	4.09	0.40
1	100	3.63	0.28
2	120	3.41	0.24
3	140	3.25	0.20
4	170	3.05	0.17
5	220	2.79	0.13
6	270	2.59	0.10
7	340	2.41	0.08
8	450	2.21	0.06
9	580	2.03	0.05
Dust	2770	1.2192	0.0109

6. The provide larger surface area for burning.
7. An ounce = 28.35 g.

The usual quantity of the shot charge in a 12-bore shotgun cartridge is about thirty grams. It varies from twenty-five grams to about thirty-five grams. Sometimes slugs of special constructions (rifled) are used in shotguns to give them spin to increase their range and to make the aim more accurate.

Bullets are used as projectiles in rifled firearms. They are made of lead alloy, for low-velocity ammunition and high-velocity ammunition bullets have jackets made of copper, cupronickel alloy or steel. The core of the jacketed bullet is ordinarily of lead alloy. Steel bullets and bullets, which have partly steel core and partly lead core are also being used currently in-service ammunition.

Lead bullets are used in revolvers and sometimes in pistols. They are not suitable for cartridges developing high velocity because lead bullets are deformed due to excessive heat produced melt the metal as lead has a low melting point. Nor are they satisfactory for magazine loading firearms because they obstruct the loading mechanism, sometimes. Jacketed bullets are being used increasingly now both for pistol and revolver ammunition.

The bullets have various shapes and forms. They may be streamlined, boat-tailed or they may have a flat base. They may have a flat nose, a round nose, a pointed nose or a pencil nose. The bullets may be short, medium or long.

A bullet may or may not have cannelures (corrugated circular surface near the base). The lead bullets have cannelures, usually. Some grease is placed in the cannelures for lubrication during its passage through the barrel.

The nose of the jacketed bullet may be thin, hollow, exposed or cut for greater wounding effect due to fragmentation. In earlier British Raj, Dum-Dum bullets for service rifle (0.303) were used. They had thinned jacket at the nose. The bullet shatters in the body and caused extensive trauma, injuries and deaths. Hollow point/soft nose bullets of the modern ammunition give similar terminal ballistics. They shatter inside the body. These and other types of expanding bullets are being used increasingly in service ammunition.

The diameter of a jacketed bullet is slightly larger than the diameter of the barrel bore for which it is meant. This seals the barrel and prevents the escape of gases. Besides, it ensures proper setting (housing/fitting in the barrel) of the bullet in the barrel which ensures proper spin. The diameter of lead bullets is either equal or slightly less than the diameter of the barrel. Lead bullets expand and fill the bore. The larger diameter would cause excessive lead fouling.

8.3.2.4 Cartridge Case

Cartridge cases are made from a variety of materials, in varied shapes and sizes, all determined by the nature of the firearm and the ballistics requirement. Some of the salient aspects have been discussed below.

1. The tubular portion of the cartridge case may be made of paper (common in shotgun ammunition in India), or it may be made of metal. Plastics are also gaining popularity especially for shotgun ammunition. Brass is the commonest material used for shells though iron and aluminium are also being used.
2. The base of the cartridge case is made of metal in those cases where the tubular portion is made of paper. In metallic shells base is a continuation of the shell. A percussion cap is fitted in the centre of the base separately, in almost all type of cartridge cases.

3. Cartridge cases may be belted, rimmed, semi-rimmed or rimless. In the first three types, the diameter of the base is larger than the diameter of the cylinder of the cartridge, while in the last one it is either equal or smaller.
4. The cartridge case may be cylindrical throughout, has a neck or the cylinder is tapered. The type is decided by the ballistics requirements.
5. The percussion cap is made of copper, brass or cupronickel alloy.
6. In rim-fired cartridges, not only the base is a continuation of the shell but there is no separate percussion cap also. The cap composition is placed inside the rim around the base. The function of the anvil is carried out by the turned edge of the rim.
7. The cartridge case carries the identifying data of the manufacturer, the calibre and the year of manufacture.

8.3.2.5 Wads

Wads are used in shotgun ammunition mostly. The wads in the shotgun cartridge are an over-shot wad under-shot wad, over-powder-charge wad and a cushion wad. The wads keep the various components of the cartridge in position. Some noteworthy points about the wads are:

1. Wads enter the body *en masse* from contact/near contact/powder ranges
2. The overshot wad fits tightly in the case, to keep the projectile charge in place, without rattling.
3. The overshot wad is kept in position by crimping the edges of the cartridge or by turning the edge inside.
4. The overshot wad is waxed to prevent the entry of the moisture in the cartridge.
5. Most of the wads shatter into pieces in their free flight
6. Cushion wad is made of felt or paper. It seals the barrel bore and prevents the escape of gases;
7. An innovation of great importance is power piston wad, which replaces the wads mentioned above. It is a single plastic structure consisting of three parts:
   - Rectangular sleeve
   - A cushion
   - An overturned cup, as overpower device.

The power piston wad has advantages over the conventional wads.

1. They seal the barrel and prevent the escape of gases from the sides; hence they ensure more kinetic energy to the projectiles.
2. The sleeve prevents deformation of the projectiles; hence more uniform pattern is obtained.

Fig. 8.11

Sectioned view of a modern cartridge wadding. The white outtline represents plastic cup, piston and sleeve

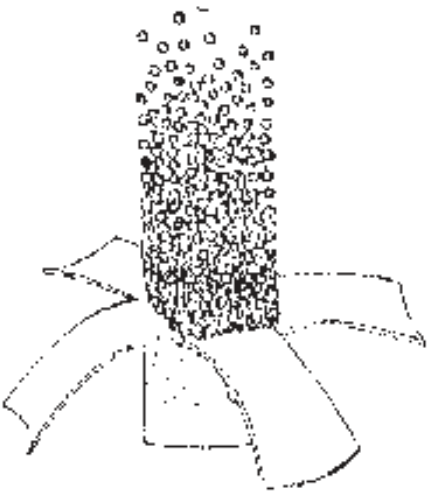

Fig. 8.12

Pellet protection sleeve opening up on firing

In rifled firearm ammunition, the bullet itself seals the mouth of the cartridge case. Sometimes a wad separates the bullet from the powder charge. The wad prevents seepage of the grease, placed in the cannelures, down to the powder charge.

The base, cylindrical surface and the top wad of a cartridge carry legends giving its calibre, type, year of manufacture, and its make, The information is ordinarily in abbreviated form. It differs with different makes. The information is often important.

In an important conspiracy case, it was necessary to establish the country of origin of the ammunition recovered from the accused. It was found that ammunition was manufactured during the Second World War by the British Government and could have come from the suspected country, (Pakistan). (CH)

8.4 THE FIRING PROCESS

When the trigger of a firearm is pressed, it releases the hammer or the striker with considerable force. The striker compresses cap composition, a pressure-sensitive material, contained in the percussion cap, by its impact. The material catches fire and gives out heat, which puts the propellant on fire. It is changed into gases quickly. The large volume of gases so produced develops high pressure. The projectile is forced out of the cartridge and is pushed through the barrel with considerable force. By the time it comes out of the barrel, it has acquired high velocity and moves towards the target.

The velocity of the projectile goes on decreasing with the increasing distance it traverses, mainly due to air resistance and force of gravity. They ultimately neutralize the forward motion of the projectile and it falls down to the ground.

If a target is met in between, the projectile strikes the target with a force due to its Kinetic Energy (KE), given by:

$$\mathbf{K\,E = \frac{1}{2} M\,V^2}$$

Here "M" is the mass of the projectile and "V" its striking velocity.

The transferred kinetic energy causes the destructive effect at the target.

A projectile coming out of a rifled firearm has two motions — translational motion (moving forward) and gyratory motion (angular spin). That is, while the projectile is moving forward, it is also rotating around its longitudinal axis. The spinning motion of the projectile reduces air resistance. The loss of velocity is, thus, slower and the trajectory is flatter. Consequently, the aim and range of projectile improve considerably.

The pressure developed in the cartridge is tremendous. It varies from 470 to 3200 kg per cm^2. It is transmitted equally in all directions. The backward pressure pushes the cartridge case backwards and sideway pressure expands the cartridge shell all around. The case, therefore, comes in close contact with the gun parts (firing pin, breech face, chamber and extractor). It picks up marks from the irregularities of the contact surface. The clarity of the marks depends upon the cartridge case, the tolerance allowed in the various parts of the firearm and the pressure developed in the cartridge.

In self-loaders and automatic firearms, either the recoil of the cartridge case or a small part of the expanding gases is allowed to leak backwards to push the cartridge case and the movable parts of the firing mechanism backwards.

An ejector is placed at an appropriate place. The cartridge case, in its backward motion, strikes the ejector and it is pushed out through a suitably located vent.

When the force of recoil/gases is spent, the firing mechanism, due to its spring action, comes forward to its original position. In its way, it picks up a fresh cartridge from the magazine and puts it in the chamber. The action stops here in self-loaders. The trigger must be pressed a second time to repeat the firing and reloading.

In automatic firearms, if the trigger is kept pressed, the firing pin is released after the cartridge is placed in the chamber. It hits/fires the cartridge. The whole process is repeated until either the magazine is exhausted or the pressure on the trigger is released.

Automatic and semi-automatic firearms throw out the cartridge cases at the scene of occurrence automatically. The position of the fired shell at the scene fixes the position/location of the shooter from where he fired the shot(s).

> *In a murder case, the eyewitness stated that there were two shots fired by the culprit from a semi-automatic firearm. The police had recovered only one fired cartridge case. Non-recovery of the second cartridge case weakened the prosecution case. (CH)*

In muzzle-loading firearms, the propellant is put into the gun through the muzzle. It is covered with some wad material. The charge is rammed in position with a ramrod. Likewise, the projectile charge is also put through the muzzle. They are covered with wads and rammed into position. A percussion cap is placed upon the nipple of the firearm, the hammer is cocked, and the firearm is ready for firing.

When the trigger is pressed, the hammer is released. It strikes the percussion cap, compressing the cap composition to give a flame. The flame reaches and puts the propellant on fire.

The powder residue, the torn percussion cap, the projectile charge and the wads form important clues in cases involving muzzleloaders.

8.5 THE PROBLEMS/POSSIBILITIES

The problems/possibilities in cases involving firearms relate to arms, ammunition, injuries, range of fire, time of fire, verification of version and sequence of events.

8.5.1 Firearms

The questions relating to firearms are:

1. Is the given device a firearm in accordance with the Arms Act?
2. Is the firearm in working order?
3. Is it liable to fire accidentally?
4. Has it been used? If so, when?
5. Was it involved in some other crime case(s)?
6. Has it been used as a bludgeon?
7. Can its erased serial number be resuscitation lead to its owner through
8. Has the firearm been tampered with? If so, what is the nature of tampering?
9. Is the firearm improvised or a factory-made firearm?
10. What are the make, model and calibre of the firearm?

8.5.2 Fired Ammunition

The following information is sought about fired ammunition:

1. Was the given fired ammunition fired from the suspect firearm?
2. What are the calibre, make and model of the firearm from which it was fired?
3. Was the recovered fired ammunition fired from one or more firearms?
4. Is the given fired ammunition similar to the live ammunition recovered from the suspect?
5. Is the recovered fired ammunition from the suspect and that from the scene, fired from the same firearm?
6. How many lands or grooves are there on the bullet?
7. What is the direction and pitch of the twist?
8. What are the widths of the lands and grooves?
9. What is the depth of the grooves?
10. Is the firing pin mark on the missed cartridge identifiable in respect of the given firearm?
11. What is the size of the given fired pellets or buckshot?

8.5.3 Firearm Injuries

The injuries provide information on the following points:

1. Are the given injuries gunshot injuries?
2. If so, what type of firearm/ammunition caused the injuries?
3. Are the injuries from one or more than one firearm?
4. Are the injuries suicidal, accidental or homicidal?
5. What was the range of fire from which the given injuries inflicted?

8.5.4 Medico-legal Problems

The medico-legal expert, who performs the post-mortem examination, in a shooting case, may have to answer the following questions:

1. Did the victim die of gunfire or did he die of some other cause?
2. Are the injuries on the deceased the result of gunfire? If so, what type of firearm(s) and ammunition were used?
3. How old are the firearm injury?
4. Is the given injury an entrance or exit wound?
5. What was the range of fire to cause the injuries on the victim?
6. How long could the victim survive after the give (fatal) injury?
7. Could the injured perform the acts attributed to him after the injury?

Note.—**Medico-legal and firearm experts should answer the questions (2) and (5) conjointly.**

8.5.5 Muzzleloaders' Problems

In muzzle-loading firearms the information sought is:

1. Were the recovered percussion cap(s) fired from the suspect's firearm?
2. Were the recovered lead shots from the victim cast in the mould recovered from the suspects?
3. Were the shots recovered from the victim and the accused prepared in the same mould?
4. Did the shots recovered from the victim carry identifiable barrel or ramrod marks?
5. Was the lead (or lead shots) recovered from the body and from the house of the accused, from the same source?
6. Do the wad materials, paper or rags, recovered from the scene (or from the victim) match with similar material recovered from the accused?
7. Does the gunpowder/GSR found at the scene or on the body of the victim and the powder recovered from the accused come from the same source?

8.5.6 Live Ammunition

Sometimes live ammunition figures as evidence. Its evaluation can answer the following questions:

1. Is the given material ammunition in the legal sense?
2. What are the calibre, nature, and make of the given ammunition?
3. Is the given ammunition fire-worthy?

8.6 LOCATION OF EVIDENCE

The main sources of firearm evidence are:

1. The victim
2. The culprit

3. The scene of occurrence
4. The firearm
5. The ammunition
6. Disposal site of the firearm/ammunition

8.6.1 The Victim

The firearm evidence, in shooting cases, on the person of the victim is substantial and significant. The important pieces of evidence are:

- Injuries
- Projectiles
- Bullet holes in clothes
- GSR deposits
- Close range firing phenomena
- Direction of fire

8.6.1.1 Injuries

Injuries provide a lot of information. The IO carries out the inquest. However, most of the examination of the body is perfunctory. It should be thorough, so that he can detect the failure of Medico-legal expert, if any, due to negligence or otherwise.

An IO is not a medico-legal expert, he may find it difficult to locate firearms injuries, especially when small calibre projectiles at low velocity have caused the injuries at the site not easily noticeable (mouth, ear, or other body orifices). It is also difficult to locate if it is small calibre projectile head injury. Medico-legal expert is the person to locate them. The IO should get complete details from the expert.

The injuries provide a lot of information including:

1) **Muzzle impression;** around the entrance hole, indicates it was a contact shot. The firearm was pressed at the site. It also indicates the type of firearm.
2) **The trajectory** (path), of the projectile in the body of a victim provides significant information: It helps to:
   - Ascertain whether the projectile was a high, medium or low velocity projectile.
   - Ascertain if it was the cause of death.
   - Determine the range of fire.
   - Discover the direction of fire.
   - Ascertain whether there was some intermediate target.
   - Indicate whether the injury or injuries are ante- or post-mortem injuries (bleeding pattern!).

In a case of alleged suicide, the only entry wound was a 12 bore shotgun injury on the left side of the neck from a close range. The exit wounds were a cluster of five wounds in a diameter of about three centimetres; on the lower part of the left shoulder. The two injuries indicated the direction of the shot. It indicated that the gun muzzle and barrel must have been held at an angle of 70-80^0 to the shoulder line. No other position of the gun could be visualized. The victim could not hold the gun in that position and fire the shotgun to create the injuries. The trigger of the gun was far too high, and the heavy gun could not be kept steady for firing! Obviously, it was no case of suicide; the person was murdered. (CH)

3) Damage to the body tissues

The extent of damage due to a firearm injury helps to:

- Find whether the shot incapacitated/killed the victim.
- Ascertain if the victim could perform the allegedly performed acts by the victim.
- Fix the quantum of compensation in non-fatal accidents.

8.6.1.2 Extraneous Materials

The victim may carry GSR, bullets, balls, slugs, pellets, wads (and/or their fragments) and sometimes material from the intermediate target, in the body. They help to:

- Link the criminal and the crime.
- Determine the nature of the arm/ammunition used to kill the victim
- Establish the range of fire.
- Indicate the intermediate target

8.6.2 The Culprit

The culprit carries important incriminating evidence:

1. **Propellant and primer residues;** they are deposited on the culprit's hands, arms, hair, face, and clothes. The deposits establish that the culprit had fired a firearm. The deposits on hand also help to ascertain whether he is left/right hander.
2. **Glass fragments**; if a culprit has discharged a firearm through a glass pane (windowpane) from close range, the blow-back glass particles fall on the culprit including on his clothes, shoes. They can connect the culprit with the crime scene and crime.
3. **Pocket dust, fluff;** Sometimes the culprit carries a firearm in his pocket; the firearm picks up dust/fluff from the pocket. If a culprit leaves/throws the firearm at the scene after the commission of the crime and it is found by the IO, the dust/fluff can link the culprit with the firearm.
4. **Previously Fired Ammunition;** a culprit may destroy the firearm after the commission of a crime. If the house and the hideouts of the culprit are searched, previously fired ammunition is recovered sometimes. This fired ammunition and the incriminating evidence, recovered from the victim/scene may indicate the use of the same firearm. The evidence, thus, links the criminal with the crime like the recovery of firearm itself.

   In a murder case, no firearm could be recovered from the suspect. However, on search, some previously fired cartridge cases were recovered from the suspect's house. The two sets of the fired cartridges were found to have been fired from the same firearm. The suspect was linked with the scene/crime. (CH)

The location and collection of previously fired cartridges and bullets should also be useful in cases where the culprit has damaged (or tampered) the firearm. The tendency to do so is increasing. If the fired ammunition recovered from the house of the suspect and the ammunition recovered from the victim or from the scene is found to have been fired from the same firearm, the presumption of guilt becomes even stronger especially if the tampering with the firearm is also proved.

In an interesting case of a gang war, the leader of one gang was killed. The members of his gang were the eyewitnesses. They alleged that they were attacked while they were running away

from the killer gang. They had no firearms and did not give any fight. However, there were recoil injuries on the left hand of the deceased. The injuries were such that they could be caused only if the victim had held a firearm loosely and fired. The injuries proved that he had a firearm and he fired the firearm with his left hand.

The evidence of recoil was irrefutable:

1) *There was blackening and tattooing on hypothenar and thenar region. The presence of blackening and tattooing indicated, beyond reasonable doubt, that he had fired a firearm with his left hand, which caused the blackening and tattooing at the sites, which is apparently from the smoke which comes from the chamber end.*
2) *There were injuries on his left hand (on the hypothenar region, distal phalange of the little finger and thenar eminence). They were lacerated wounds only and were not caused by projectile(s).*
3) *The presence of these injuries and GSR clinched the thesis that the victim had fired a handgun and thus, had given fight in the gang war.*

Fig. 8.13

The lacerated region coloured (schematic)

The position of the handgun held in the left hand is illustrated in the figures below. The arrowheads indicate the sites of contact on the left hand and the sites of recoil injuries. The deceased victim must have fired the firearm holding it loosely. The recoil of the firearm lacerated the injured sites.

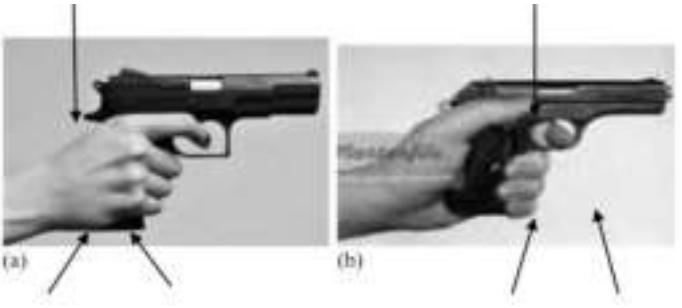

Fig. 8.14

The holding of the firearm to cause the given recoil injuries:
a. Exterior view of the hand and the affected parts b. Medial view of the hand

The injuries were not projectiles injuries, because:

- *Injuries were close to each other. No shooter, under the circumstance of the case, could achieve so close a group of injuries, even if he wanted to.*
- *There were no projectiles embedded in the hand.*
- *There were no punctured/tear wound(s) which were inevitable if they were caused by projectiles.*
- *Injury sites corresponded to the contact sites when a handgun is held and fired.*
- *The force of recoil is equal and opposite to the force with which the projectiles go forward (**To every action there is equal and opposite reaction**). This force moved the firearm violently and injures the hand.*
- *The severity of injuries depends upon the recoil force and the looseness with which the firearm is held.*
- *In short, injuries on the left hand of the deceased were due to recoil of the handgun, which was held loosely at the time of firing***.**
- *The version of the gang that they had no firearms, did not give any fight and were fired at from behind when they were running away from the killers, was false. (CH)*

8.6.3 The Scene of Occurrence

> You get only one chance to process scene. Delaying/mishandling/ non-protection can lose a plethora of evidentiary clues.
>
> **("now or never!")**

A shooting incident scene is an important repository of evidentiary clues. It needs immediate thorough/meticulous processing to search/locate/collect them. The evidence is varied and includes:

1) **Firearm;** the presence of a firearm itself is important evidence in alleged suicide/ accidental firing cases, the position of the firearm is important to ascertain the validity of the plea. The firearm may be in the hands of the person who has committed suicide, or it may have fallen close by. Elaborate arrangements are necessary if the firearm is to be fired from a distance.

   In an interesting case, the firearm was found in the right hand of the victim, whereas, the victim was known to be left-handed. Homicide rather than suicide was, therefore, suspected. The investigation confirmed the suspicion. (CH)

2) **Fired cartridges**; they are often found at the scene of occurrence. In semi-automatic/ automatic firearms, the ejector throws out the fired shell at the scene automatically, after each fire.

   The position of the fired cartridge, in automatic/semi-automatic firearm firing, the position of the culprit, at the time of firing, is also fixed. The cartridge cases are thrown out in a definite direction to a definite distance. It thus also indicates the range of fire.

   In non-automatic firearms, the culprit often reloads his firearm and leaves the fired cartridge(s) at the scene.

   Theoretically, the culprit can and should take away the cartridge cases. But in practice, it seldom happens. The emotional disturbance and the urge to leave the scene at the earliest, usually, prevent the culprit from taking away the fired cartridge cases.

3) **Projectiles;** the projectiles sometimes are embedded in the walls, doors, furniture, trees and ground at the scene. The sites are carefully examined, and projectiles recovered. The positions of the projectiles/their marks help in the reconstruction of the crime.

In a multi-murder case, it was alleged that the culprit killed the victims after tying them to a tree. The stump of the tree was examined. No bullets, their fragments or even their marks could be discovered on the stump of the tree. The version of the complainant was false. (CH)

4) **Wads;** shotgun cartridges contain wads. When a shotgun is fired, wads and/or their fragments fall at the scene; unless they are found inside the body of the victim/inside the target. Their positions help to establish the direction and the range of fire and help in the reconstruction of the occurrence.

5) **Marks;** bullet dents and ricochet mark on doors, windows, walls, floor and furniture help to reconstruct the occurrence.

Fig. 8.15

Scene after the removal of victim

8.6.4 The Firearm

The firearm itself is an important piece of evidence. The criminal does not leave it at the scene unless he plans to show the crime as a suicide or an accident. The make and model type, serial number, its firing capacity, calibre and barrel length, are recorded.

The firearm is often recovered from the culprit or from his house. He may have, however, hidden, destroyed or thrown away the same. In the latter cases, the investigating officer should

put himself in the role of the culprit and follow the route of the culprit's departure from the scene. He should check all likely places where the firearm could have been disposed of conveniently without attracting attention. Trained police dogs also help to locate the firearm.

The recovered firearm provides varied evidence:

1. **Linkage;** it links the criminal with the crime through the identification of fired bullets/cartridge cases recovered from the victim or from the scene.
2. **Fingerprints;** the recovered firearm may carry fingerprints. It is handled carefully to prevent their mutilation. Fingerprint expert processes them.
3. **Gunshot residues;** gunshot residues are found in the barrel of a firearm and on the firing mechanism. They help to establish the approximate time of fire.
4. **Rust and dust**; the presence of rust or dust in the barrel indicates that the firearm has not been used for some time. It can, thus, eliminate some suspected firearms and consequently their owners.
5. **Blood, flesh and skin;** the firearm may carry blood, flesh and skin from the victim. It often happens in contact shot firing. The materials, Via DNA, establish a definite link between the victim and the firearm (and the owner of the firearm).
6. **Identity of Firearm;** a factory-made firearm has manufacturer's name, logo and a serial number engraved on it. They help to locate the owner.

The criminal sometimes erase/mutilate the engraved identifying data. Resuscitation of the mutilated data, usually through chemical processes reveals the same.

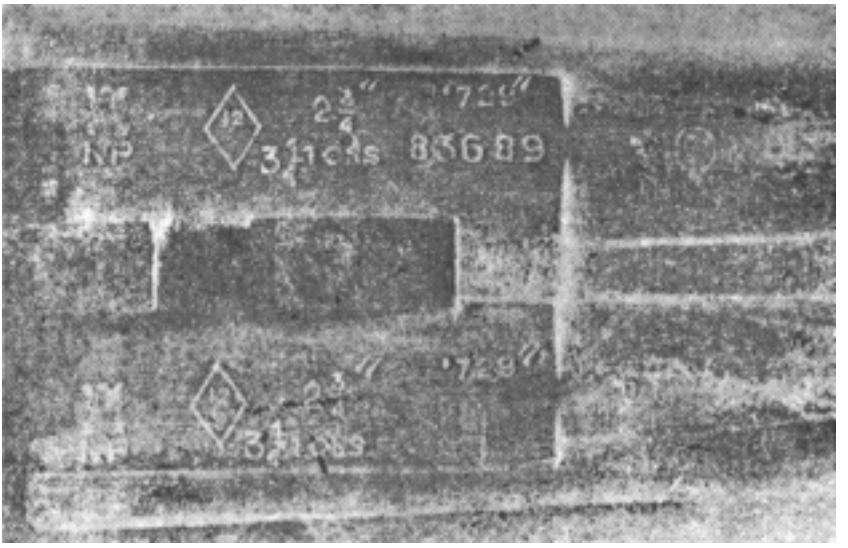

Fig. 8.16

The serial number and other identification marks on a 12 Bore DBBL gun

A few years ago, a firearm was received in the laboratory to decipher its erased serial number. Resuscitation of the number connected two murders.

The firearm had been taken from a police officer after killing him. The murder had remained untraced till then. (CH)

Firearm reports and flashes sometimes figure in criminal cases. However, a definite opinion about them is not yet possible. Research is going on in this field.

8.6.5 The Ammunition

The live ammunition has forensic importance. It provides the right material for test purposes. It is recovered, ordinarily, from the house of the accused. In case the culprit has spent all, the source of ammunition for test purposes is the arm and ammunition dealer from whom the culprit purchased the ammunition.

Fired bullets and cartridge cases are recovered from the victim or from the scene. They carry thumbprint of the firearm, which fired them. Thus, they link the criminal, from whom the weapon is recovered, with the crime.

Fired ammunition (cartridge cases) at the scene of occurrence occasionally may carry fingerprints of the culprit. They are of great evidentiary value.

8.7 COLLECTION

IO at Shooting Scene (Nutshell)

1. Provides medical assistance to the injured
2. Frames investigative strategy
3. Ensures safety of the investigating team
4. Preserves, protects, documents/records the scene (videography, photography, sketching, textual notes)
5. Detains suspects, arrests culprits, segregates witnesses, collects intelligence about absconder(s)
6. Locates, collects, preserves, packs, seals and despatches the physical evidence present at the crime scene/with the culprit/victim/vehicle/weapon/intelligence people
7. Attends post-mortem examination, to get comprehensive medical data about the deceased and the complete injury profile
8. Utilises all the resources at his disposal (and more) in investigation
9. Keeps the seniors informed about the progress
10. Releases the scene only after he has finished with it
11. Follows the law and the departmental rules
12. Records the basic data:—
    - His Arrival time at the scene
    - The weather conditions at the scene
    - The state (condition) of doors/windows/ventilators/bathrooms/taps**.**
    - Any oddities at the scene, characteristic odour?
13. Records the action taken at the scene

The investigating officer plays a crucial role in furnishing firearm evidence in shooting cases. He collects:

8.7.1 Firearm

The firearm may carry fingerprints, fibres, blood, flesh, hair or any other extraneous material. Or, it may be loaded and may go off while being handled and thus prove fatal to the investigating officer or person standing nearby. The investigating officer, therefore, while collecting the firearm, should:

1. Ascertain whether the weapon is cocked or not, its safety catch is on or off, the firearm is loaded or not. He records the state and takes action to make the firearm safe for handling.
2. Handle the firearm in such a way that even if it goes off it does not injure anybody by ensuring that nobody faces the muzzle of the firearm.
3. Consider the firearm safe only when he can see through the barrel and the magazine, if any, is detached.
4. Hold the firearm from a place so as not to destroy the existing evidence (like fingerprints), nor any new evidence is introduced. The firearm is held from the sling, ring, trigger guard or from the corrugated surfaces on the butt.
5. Search for extraneous evidence like hair, fibres, bloodstains, skin, flesh, paint or dust. These items may not be adhering to the firearm firmly and may get lost. They are, therefore detached and packed in small separate cellophane pouches before the firearm is processed for fingerprints.
6. Avoid touching the inside of the barrel. The presence or absence of rust, fouling, dust, skin, flesh, blood and other materials can lead to important conclusions. If anything is introduced in the barrel, the evidence is contaminated, mutilated or lost. He caps the barrel.
7. Check the breech face of the firearm. It may bear marks in dust or grease. He photographs them.
8. The breech face may carry enamel or paint from the cartridge fired through firearm. The materials help in the identification of the cartridge.
9. Avoid carrying the firearm in a pocket or in a dirty or dusty container. It is likely to introduce dust or dirt in the barrel, which can mislead the expert.
10. Put identification marks (case number, initials with date) and get signatures of the witnesses on the firearm. The signatures are put at a prominent part like barrel, action block or stock and not on an interchangeable part.

    The detailed particulars (FIR No. with date, and name of the police station) are scratched on the firearm, at a place where there is no evidence.
11. Place it in a cellophane envelope if it is a handgun. The envelope is put in a box with clean rags or cotton wool padding, so that the firearm does not rattle inside. It is then packed, sealed and dispatched to the laboratory with usual formalities.

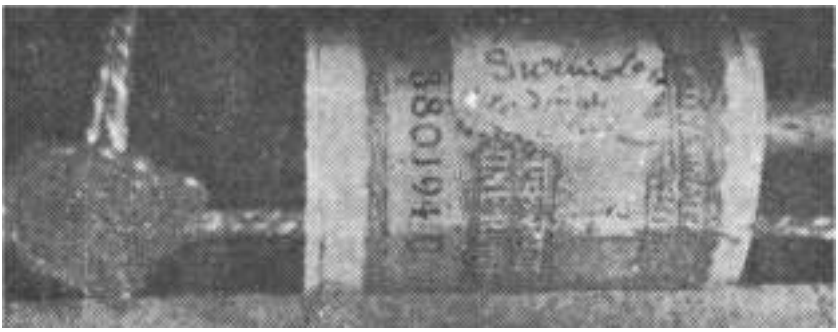

Fig. 8.17

Sealed and signed chit (one rupee note with serial number!) fixed on a gun. The gun is not properly sealed. it should be covered with a cloth after placing in a cellophane sheet

12. Take exhaustive notes to:
    - Record the positions of the firearm with respect to other articles at the recovery site. Sketches and photographs help.
    - Indicate the conditions whether the firearm was loaded or not, whether the safety catch was on or off and whether the firearm was cocked or not. In the case of a revolver, he indicates the position of the fired and live cartridges in a sketch.
    - Record the nature, quality and quantity of the extraneous evidence discovered and recovered.
    - Record the make, serial number, proof marks, decorative designs, the dimensions of the firearm and its important parts, especially if there is any peculiarity in design, construction and mechanism.
    - Record the source of the seal, if it is not the seal of the investigating officer and the number of seals put on the parcels. He keeps a specimen impression of the on the file. Another impression is sent to the expert.
    - Record the addresses of the witnesses.

In addition, he observes, scrupulously, the instructions given on documentation of the scene in the chapter on "***Scene of Occurrence***" of this book.

8.7.2 Cartridge Cases

While collecting cartridge cases, the investigating officer should:

1. Detach any extraneous matter adhering to it without mutilating fingerprints, if any, and collect the same in the usual way.
2. Preserve fingerprint, if any.
3. Initial the cartridge case, preferably inside, with a pin.
4. Record the legend found on the cartridge case in the case diary.
5. If more than one cartridge is to be packed in the same box, put each cartridge case in a cellophane envelope and pack these envelopes in a box with sufficient padding to avoid rattling.

8.7.3 Bullets

The medico-legal expert extracts bullet(s) from the body of a victim. The IO also recovers them from furniture, wall, floor, at the scene. He sometimes finds them entangled in the clothes of the victim or lying at the scene. The bullets are often found damaged. They brook no further mutilations if they are to be useful in the delivery of justice. Therefore, they need careful handling in the extraction process and putting identification marks on them.

The Medico-legal experts extract bullets from dead bodies. They take care to:

1. Establish the exact location of the bullet through X-rays.
2. Extract the bullet with hands covered with rubber gloves, whenever possible
3. Cover the tips a pair of forceps with rubber/plastic covers, if it has to be used. It avoids/reduces damage to the striations existing on the bullet.
4. Avoid prying out a bullet from its seat, if it is embedded in bone. He cuts the piece of bone containing the bullet and breaks the bone in such a way that the bullet is not damaged in the process.
5. Put identification marks (initials) on the base or on the tip of the bullet. The surfaces do not carry marks.

In a multi-murder case, one of the pleas of the defence for acquittal was that the Medico-legal expert, who had extracted the bullets and their fragments from the dead bodies, could not identify them at the time of giving the evidence. The doctor had not put any initials on the bullets. (CH)

The investigating officer collects the bullets found in furniture, wall, wood, floor or earth. Whenever possible, he should send the original article containing the bullet to the expert.

The bullet may carry traces of sand, paint, wood or fibre when it has ricocheted. The traces can be detected through microscopy, they must be protected properly.

8.7.4 Slugs and Shots

Slugs, shots, pellets, wads and powder residues often figure in criminal investigations. These articles are marked individually for identification purposes whenever possible. The slugs, shots and pellets may carry identifiable barrel marks sometimes. While extracting them from the body of the victim/or elsewhere, care is taken to prevent damage to the marks, as in the case of bullets.

8.7.5 Clothes

The clothes often carry GSR and projectile holes. In their collection, care is taken to:

1. Dry the clothes before packing if they are wet.
2. Protect the marks with a cellophane sheet. The sheet is fixed (attached) with an adhesive tape/adhesive.
3. Put the identification data (name of the owner, the date of recovery, the case identification marks, initials) on clothes at a place, which is free from evidential clues.
4. Pack the clothes in sturdy dust-proof paper bags.

8.7.6 Live Ammunition

A whole lot of the live ammunition found with the suspect is collected and dispatched to the forensic science laboratory through a special messenger observing all formalities. It is properly packed, labelled and handled to avoid accidental explosion due to friction or other causes.

8.7.7 Glass Fragments

Tiny glass fragments are difficult to collect from the clothes/shoes. They, therefore, should be sent to the laboratory as such. The laboratory staffs know how to collect them.

If the IO has collected the glass fragments, he places them in a glass vial or in a clean small envelope and dispatches them to the laboratory in the usual way.

8.7.8 Gun Shot Residues (GSR)

GSR is deposited in the hands of the shooter (culprit/a suicide). The suspect is taken to the nearest forensic science laboratory, if possible. Or, the services of a Forensic expert are requisitioned. Alternatively, the discharge residues are collected as under:

1. Molten wax of appropriate melting point is deposited slowly until about two-millimetre-thick layer is formed on the hands of the suspect. The cast is peeled off. The cast is placed between two inflexible plastic/glass sheets. They are held together with adhesive tape or cement. It is packed and forwarded in a suitable cardboard box.
2. The hands of the suspect are swabbed with clean surgical cotton wool dipped in dilute acetic acid, hydrochloric acid or nitric acid (5%). The dilute acids dissolve the discharged residues. The solution along with the swab is put in a clean glass vial. The vial is properly corked, packed and forwarded.
3. Adhesive tape, collodion solution, and cellulose acetate solution are also used to lift powder residues from hand.

8.7.9 Injuries

A medico-legal expert, who performs the post-mortem/medico-legal examination, examines the injuries. In certain cases, a firearm expert joins the medico-legal expert team. He helps to collect correctly the foreign materials (projectiles/wads/GSR,) in/on the body and to assist the team in the evaluation of the injuries. He is also able to know the nature/damage/angle of fire/range of fire from the injuries.

Post-mortem/medico-legal reports provide complete/correct details. They are illustrated usually through sketches/diagrams/photographs (taken along with scale).

If the firearm or the ammunition or both have been recovered from the suspect, they are sent to the laboratory along with other documents.

8.7.10 Bullet Holes

The original articles, bearing the bullet holes, dents, or other marks are collected whenever possible. The scaled sketches and photographs showing the details of the marks, their positions on the item and also the position of the article are sent only when the article cannot be transported to the laboratory. They are poor substitutes.

The expert should visit the shooting scene in important cases. Direct visual examination of the scene permits a better appreciation of the evidence.

8.7.11 Test Exhibits

The expert himself prepares the test exhibits. The investigating officer should not fire and send cartridge cases, bullets and test patterns to the experts.

The best test materials are the same firearm arm and similar ammunition. The recovered ammunition (and firearms) are therefore, sent to the laboratory.

8.8 EVALUATION

The identification of fired cartridges, bullets and balls, in respect of the firearms used to fire them, is the most important evaluation in forensic ballistics. Like fingerprints, the identifications are definite: positive or negative. The following principles and procedures are involved in the work:

8.8.1 Principles

8.8.1.1 Unique firearm marks

The firearms imprint unique and individualistic marks on fire cartridges/bullets and other projectiles.

The parts of a firearm that come in contact with cartridges on firing, are firing pin, breech face, extractor, ejector and the chamber. They leave indentation marks on the fired cartridges.

Likewise, the barrel of a firearm scratches a tightly fitting projectile when it passes through the barrel. Scratches create striations (lines).

Both indentations and striations have unique (individualistic) profiles, because:

- These parts are made of hard metal/metal alloy (steel) by cutting, hammering, filing, reaming and polishing. The processes leave unique surface patterns.
- The functional surfaces of the tools used, continue to change because of wear and tear and accidental damages they suffer due to working on harder metal/alloy.
- The application of these tools in their manufacture, to create these parts, involves mostly random motion.
- The finished surfaces of the relevant parts of all firearms are, therefore, never alike even when the two firearms (and their surfaces) are created with the same set of tools, one after the other. Consequently, all firearms, even the two barrels of a double-barrelled firearm, show a complete individual pattern of the indentations/striation they leave on the fired cartridge cases/projectiles.
- The individuality of each firearm has been established by actual experiments carried out in the initial stages of the development of this science.

  A long barrel was bored and grooved with the same set of tools. It was then cut into six pieces. The six barrels thus obtained were fitted to six handguns. The bullets fired through the six barrels were correctly identified in respect of the individual barrel of the six firearms.
- With the use/abuse of the firearm, the wear and tear and accidental damage further enhance the irregularities of its surfaces.
- When a cartridge is fired, the irregularities (nicks and corners) of the surfaces come in close contact (under pressure) with the cartridge case or on the bullet and imprint their patterns on them. These patterns are so individualistic, like fingerprints that some experts call them as the thumbprints of the firearms. They provide definite firearm-cartridge/bullet linkage or elimination.
- The cartridge cases and bullets are, ordinarily, made of comparatively softer materials than the material (steel) of the firearm. The marks producing surfaces, therefore, do not change substantially for thousands of shots and the fired ammunition can be identified even when the firearm is recovered after a long interval.
- If the firearm is ill kept, misused or intentionally tampered with, the surface characteristics change. The fired ammunition may or may not then be identifiable after the change; depending upon the changes made in the firearm surface. Each case has to be decided by actual experiments.

In a murder case, the firearm was buried underground for many months. After careful cleaning test bullets were obtained. It was possible to identify the crime- bullet by comparing the same with the test-fired bullets, in spite of the fact that the firearm had rusted extensively from outside. (CH)

In another case of murder, the culprit got the firing pin replaced from a machinist immediately after the murder. He paid for the services and got a receipt for the same.

After some time, the police seized the firearm and sent it to the laboratory along with the cartridge case recovered from the murder scene. The expert linked the cartridge to the firearm.

The defence counsel argued that the cartridge could not have been fired from the weapon as the vital part of the weapon (the firing pin) had been replaced after the date of the occurrence of crime!

The prosecutor and the judge were perplexed. The court called the expert.

The expert informed the court that the firing pin marks on the test and the crime cartridge case did not correspond. It meant that the firing pin had been replaced (as suggested by the defence). But the breech face marks on the crime and test cartridges provided ample evidence to show their common source of origin. The photographic illustrations convinced the court.

Fortunately, the trickery (fraud) of the culprit did not succeed! (CH)

- Sometimes a very old firearm is used in the commission of a crime. Due to extended use over long periods, the barrel of the firearm is "washed" and its bore becomes larger. A bullet fired through such a firearm barrel does not "house" properly. The bullet may/may not pick up identifiable marks – the thumbprint of the firearm. Ordinarily, this does not happen during the interval between the commission of the crime and recovery of the firearm used in criminal cases.
- Some criminals use previously fired bullets in cartridges of a higher calibre. For example, 32 fired bullets is placed in a 12 bore cartridge and fired. This misleads the investigating officer. He searches for a rifled firearm rather than a shotgun. It complicates the investigations.

A few years ago, a culprit shot and killed a man with a 12-bore shotgun. He was caught "red-handed". He admitted the firing before the police and handed over the gun with a cartridge case in its barrel.

At the time of post-mortem, the doctor recovered a fired projectile from the body of the victim. But nobody bothered to notice its nature. In the trial, the culprit pleaded false implications and got acquittal because the projectile recovered from the victim was fired from a rifled firearm. Presumably, the culprit had put a fired bullet in the shotgun cartridge. (CH)

4. If a cartridge of lower calibre is fired through a firearm of a higher calibre, its bullet does not fit in the barrel and often does not take identifiable marks. If some marks are discovered on the bullet, they are compared with fired test bullets of the correct calibre (corresponding to the firearm). In some such cases, the test bullet of the right calibre does not give correct comparable marks. In such situations, a lead bullet or a slug (specially prepared) of slightly larger diameter than the bore is pushed through the barrel. It takes up most of the marks from the barrel and provides useful test material for comparison in some cases.

8.8.2 Class and Individual Marks

The position, size, shape and depth of firing pin, breech face, extractor, ejector and chamber marks on a fired cartridge case constitute class characteristics while finer details in the marks give the individual features of the firearm.

Similarly, the number/ width/depth/direction and pitch of the lands and grooves on a fired bullet indicate class characteristics of a firearm while finer details in the lands and grooves are individual characteristics of the firearm.

Class characteristics are common on the ammunition fired from firearms of the same make and model, but they differ with different makes and different models of the same make. Individual features are so named because they are always different, and no two firearms have the same characteristics.

The class characteristics are useful in quick eliminations of some suspected firearms. The nature of a firearm and possible make is indicated by the class characteristics. This indication is useful when the firearm is not recovered immediately and there are a number of suspects.

8.8.3 Test Exhibits

The identification of fired ammunition is always carried out by comparison of marks with text exhibits. Ordinarily, two test cartridges are fired. However, in the case of some firearms even one cartridge may be sufficient. In certain high-grade firearms, the marks are not clearly imprinted, when even a dozen cartridges may have to be fired. The number of test cartridges is not material. The limiting factor is only the clarity of the marks. If clear marks are obtained on the first cartridge, it is not necessary to fire a second cartridge. Formerly, it was suggested that a number of cartridges should be fired, and the test exhibits be studied *inter se* to establish the thumbprint of the firearm. It is no longer necessary because the individuality of each firearm is established/accepted by all concerned. The following aspects are kept in view:

8.8.3.1 Ammunition

Ammunition of the same make and batch is used for test purposes, whenever possible, though it is not necessary and not always possible. Ammunition recovered from the suspects, if any, is often used for test purposes, if it is of the same make.

8.8.3.2 No Firearms

In case no firearm is recovered (no gun work!) from a suspect, but fired ammunition is recovered from him or from his residence, the same is used for comparison purposes. They may provide definite linkage/de-linkage *inter se.*

8.8.3.3 Defective Firearms

It may not always be possible to fire a fully loaded cartridge, for test purposes, with a defective firearm. Some of the charges is removed in such cases. If the questioned exhibit is a cartridge case, the projectile charge of the round is removed. If a bullet is the questioned exhibit, the powder charge is reduced to about one-half to one-third.

8.8.3.4 High Velocity Rifles

In high velocity rifles, it is inconvenient to recover a bullet when a fully loaded cartridge is fired. The powder charge, therefore, is reduced to about one-half to one-third.

8.8.3.5 Damaged Firearms

In some cases, the crime firearm is so much damaged that it cannot be fired to get test exhibits. In such cases, the cast of the relevant impacting surface is prepared and compared with the

crime fired ammunition. Silicone polymers are considered most suitable materials. Cellulose acetate solutions have been in use for a long time

If the crime exhibit is a bullet, a test bullet is obtained by pushing a bullet of the same calibre through the barrel. Usually lead bullets are used for test purposes.

> *In a case of dacoity and murder, the firearm was so damaged that no test cartridge could be fired. A bullet, extracted from a cartridge, was pushed through the barrel. It provided an excellent match. (CH)*

8.8.3.6 Recovery

When only a cartridge case is the crime exhibit, the projectile charge is not collected. The test cartridges are fired at a firing range and the cases are collected.

For the recovery of projectile charge, a number of materials and devices have been suggested and used. A bullet recovery box, however, has been found simple, convenient and safe. It is a box about 2 metres long and about 25 centimetres square in cross-section. It is open from one side through which the projectiles fired. It is divided into five to six compartments, which are filled with clean cotton waste. The upper plank forms the lid of the box.

A test bullet is obtained by firing a similar cartridge in the recovery box. The bullet due to spin, forms a ball of cotton around it and is stopped at a short distance. The cotton ball protects the marks from damage/mutilation.

In place of cotton, rags, water, soap and paraffin have also used as the stopping media. They do not appear to offer any advantage over the cotton waste bullet recovery box.

Pellets and buckshot are recovered in a water drum with a false conical bottom. The shotgun is fired at the top. The shots travel through the water. By the time they reach the bottom they lose their kinetic energy/velocity. They collect at the bottom, from where they are recovered.

8.8.3.7 Cleaning

The bullets and cartridges are cleaned before they can be examined and compared. Dust and dirt are removed with a cotton wool swab. The grease from the surface is cleaned with benzene. Dilute acetic acid and dilute hydrochloric acid are also used to clean the surface.

If the surface of an exhibit is highly reflective it cannot be conveniently examined or compared. The surface is dulled by smoking it over burning magnesium. A thin coat of magnesium oxide is deposited which decreases the reflectivity of the surface appreciably. Glare is reduced by using a polarizer filter.

8.8.4 Examination

The visual examination allows quick eliminations and thus save a lot of time in cases involving a large number of firearms. It gives the position, size and depth of the firing pin, breech face, extractor, ejector and chamber marks. Sometimes there may be gross characteristic indentations, which permit quick identification or elimination of a suspected firearm in respect of a cartridge case.

Visual examination of bullet indicates the calibre, the number of lands and grooves, their depth, width, direction and twist. Visual examinations of these class characteristics make it possible to eliminate some firearms easily. Positive identifications, however, are rare.

Visual examination is carried out with ordinary light, being thrown at different angles.

8.8.5 Stereoscopy

Stereoscopy offers a 3-dimensional image of a mark. It reveals details more vividly. In fact, stereoscopic examination alone can provide positive identification of the cartridge case exhibits.

Test and crime cartridge cases are placed side by side (or one after the other). Spotlight lamps are used to illuminate them properly. The light falls on the two cartridge cases at the same angle.

The examination is started with the lowest magnification of the stereomicroscope and it is increased progressively. At higher magnifications, the cartridges are examined in turn because both are not covered in the field simultaneously. The cartridges are rotated through 360°. They are tilted, if necessary.

Stereoscopic examination of bullets may give positive identifications in some cases, not in all cases. The examination, however, always facilitates the comparison. It gives the idea as to what should be looked for in the comparison microscope.

8.8.6 Comparison Microscope

A comparison microscope is the ideal instrument to compare striation marks on bullets/ cartridge cases. Comparison work is best carried out with a. The instrument is in fact a combination of two microscopes, with identical optics. Here the images formed by each microscope are brought to focus in the same eyepiece through prisms.

A comparison microscope has arrangements for photography. Thus, the match found visually is recorded photographically for presentations, in a court, if required.

The instrument has mechanical stages. They allow up and down, and left or right movement of the exhibits. The stages can be rotated through 360°. It can be tilted if required.

The exhibits are illuminated by spotlights with arrangements for adjusting height, angle and the intensity of the illumination. Some makers provide a single fluorescent tube light lamp. Others provide two-lamp arrangement or both.

Fig. 8.18

An excellent striation match

8.8.7 Comparison Camera

Comparison camera is another device to compare marks on two entities. The instrument and working with it is cumbersome. Besides, it does not offer any advantage over a

comparison microscope. In fact, it is inferior in many respects. It is not used in professional work.

8.8.8 Striagraph

Striagraph is another instrument to study and compare the striations on projectiles or on other objects. The instrument does not offer any advantage over the comparison microscope. In fact, it has many drawbacks. It is not used for casework in Forensic Science laboratories.

8.8.9 Periphery Photography/Camera

A periphery camera is also known as strip or peripheral camera. It creates a two-dimensional image from a three-dimensional object surface. For example, the marks on the cylindrical surface of a bullet are captured on a 2-dimensional plane through a periphery camera (also known as strip or peripheral camera) on a plain sheet of film.

The periphery camera has a vertical slit aperture. The camera is fixed opposite the bullet. The film in the camera and the bullet have synchronised rotation (in opposite directions). They rotate with the same angular speed through 360^0 in the same interval of time. The images coming in front of the slit are record on a strip, merged into each other giving it a connected photograph of the circular surface, which is recorded on the film. The image is transferable to a computer and then the image can be

1. sent to various destinations through e-mail/Internet.
2. be printed on a strip/film/ sheet and can be compared with similar sheets prepared from test bullets. The comparison indicates the common or different source(s) of the marks.
3. Compared with similar images to ascertain common source or otherwise.

The camera has certain advantages:

1. It provides a comprehensive view of all the marks on the cylindrical surface of the projectiles in one go.
2. The images can be examined and compared at different (even distant) places simultaneously without the actual crime exhibit. A number of images (photographs) are prepared and circulated among different experts. Online transmission of the images, through the Internet, has dispensed with the necessity of preparing and sending image strips or photographs.
3. The instrument, previously (in the initial stages), did not give satisfactory results with deformed bullets. However, the problem has been overcome since.
4. It has reduced the drudgery of microscopic examination for long hours.
5. The identification/non-identification of the common source through the processes is both cost and time effective, once the initial investment has been made.

The importance of the periphery camera has gone up very high with the advent of Firearm Data Banks, the repository of digitized identification data of firearm marks (thumbprints of firearms). NIBIN[8] (National Integrated Ballistics Information Network) is such a system in which automated comparisons of identification data is done.

8. For more details see the author's book: ***Firearms in criminal Investigation and Trials***, LexisNexis, 2017.

8.8.10 Photographic Comparison

The comparison microscope and other comparison devices are useful and convenient, but they are not indispensable, in some cases. An ordinary microscope comparison can be made via a photomicrographic camera. The corresponding photograph of the test and crime exhibits are prepared and compared.

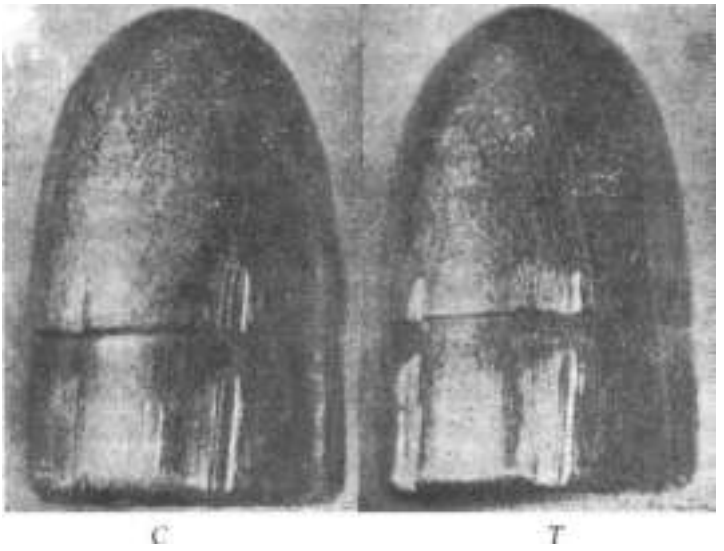

Fig. 8.19

Even macrophotography can identify bullets (C and T) under favourable circumstances as in the above case

8.9 ODD IDENTIFICATIONS

8.9.1 Damaged Cartridge Cases

In illegally improvised (also known as country-made) firearms, fired cartridge cases are often damaged extensively. The percussion cap is found pierced or blown off. The shells are found shattered. However, identification of the used firearm is still possible even in such cases most of the times; because they carry numerous marks from the firearms. Breech face/extractor/chamber marks are frequently found on the damaged cartridges.

8.9.2 Damaged Bullets

Crime bullets, fired from high velocity rifles, are rarely recovered in their original shape. They are deformed and sometimes fragmented. Some portions of the bullet, especially of the jackets of the bullet, however, retain un-mutilated marks. They carry sufficient details to permit their linkage with the firearm. Lead bullets in some cases, may not retain the barrel marks.

8.9.3 Burnt Bullets and Cartridge Cases

The culprit may have thrown a cartridge case in a fire after the occurrence. If it has not melted, the marks found on the remnants, may allow identifications. Lead bullets ordinarily lose all identifiable marks, while jacketed bullets and metal bases of cartridges retain the marks.

In a murder case, the body of the deceased was burnt. The investigating officer, however, recovered a lead mass from the ashes. Its evaluation revealed that it originally formed a bullet. It contradicted the defence version that the deceased died a natural death. The bullet mass, however, could not be linked to the suspected firearm. (CH)

In another case of murder, followed by arson; a burnt cartridge base was examined. It was possible to identify the firearm that had fired the cartridge. (CH)

8.9.4 Smooth Barrel Marks

Bullets, balls and slugs are also fired through smoothbore firearms. The firing process imprints the barrel irregularities (its thumbprint) on the fired projectiles in the form of scratches (striations/lines). They are individualistic and allow identification of the barrel from which they have been fired. Test exhibits are prepared by firing similar bullets, balls and slugs through the firearm barrel. Alternatively, bullets or slugs of the diameter of the bore are prepared and pushed through the barrel of the firearm. They pick up the barrel marks.

The comparison of the crime and test exhibits identifies the possible common source; or, eliminates the suspected source.

8.9.5 Buckshot[9] and Pellets

Formerly, the identification of buckshot and pellets fired through a smoothbore firearm was considered impossible. Experiments in the author's laboratory have proved it otherwise.

It appears that buckshot packed between the wads in a cartridge, is pushed through the barrel without any appreciable sideway (or turning) motion. The buckshot on the periphery is scratched by a segment of the inner surface of the barrel. They pick up the marks from these segments (corresponding to a land of a rifled barrel) like bullets. The marks of a given segment of a barrel are consistent like those of a land marks in a rifled firearm.

Test marks are obtained on a specially prepared slug that fits tightly in the barrel. It is pushed through the barrel (without turning motion). It takes up marks completely from the internal surface of the barrel.

The comparison of the marks on buckshot with the marks on the slug is carried out with a comparison microscope like a bullet.

Buckshot and pellets are sometimes housed in a sleeve (power piston wadding!), placed in a cartridge. The sleeve prevents/protects the pellets or buckshot from being scratched by the barrel. Such buckshot cannot be linked to the firearm through which they are fired.

9. In a landmark judgment (*State of Madhya Pradesh v Paltan Mallah*, **AIR 2005 SC 733 : 2005 Cr LJ 918)**, the Supreme Court of India has accepted the buckshot identification.

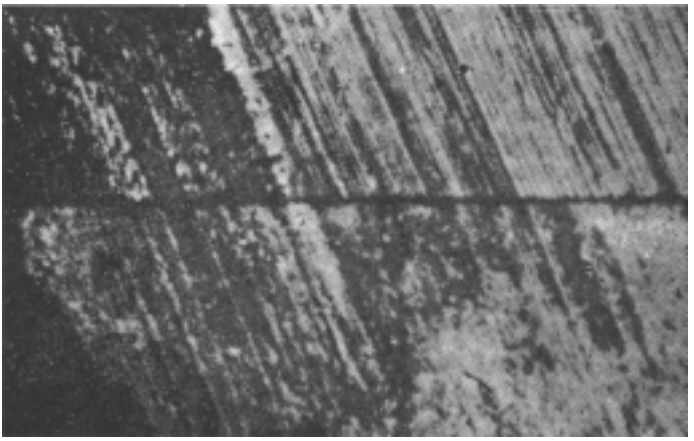

Fig. 8.20

Striations on buckshots and test slugs can be matched liked striations on bullets

8.9.6 No Firearm[10]

Sometimes the firearm used in a crime is not recovered in the early stages of the investigation or at any stage. The investigating officer usually seeks guidance about the nature and number of the firearms involved. The IO provides the fired ammunition recovered from the crime scene. It is possible to give the number and the types of firearms used from the fired ammunition provided, in some cases. The number of firearms used can be given in almost all cases, from their individualistic marks present on the fired cartridges/projectiles.

The class and individual characteristics in the marks on the fired ammunition give an idea about the number, nature, calibre and possible make of the firearms used[11].

> *In a famous multi-murder case, fired projectiles (bullets fragments, bullets, buck shots and some wad pieces) were recovered from the bodies of the victims. By careful examination it was possible to indicate that four firearms: two revolvers of .32 and .38 calibres, one .30-06 rifle and one 12 bore shotgun had been used. (CH)*

8.10 GUNSHOT RESIDUES[12]

The gunshot residues (GSR), also known as firearm discharge residues, are a product of the burning of propellants in cartridges when they are fired from firearms. The term GSR (a sort of acronym) has become popular for the gunshot residues and shall be used frequently in the discussion in the book.

10. Popularly known as **"No gun work"**.
11. It is unfortunate that the fact was not brought convincingly to the notice of the Supreme Court in the case Sidharth Vashisht *@ Manu Sharma v State of Delhi (NCT)*, **(2010) 6 SCC 1**. The Apex Court was not made aware of the fact convincingly.
12. More details on GSR are in chapter 13 of the author's Book: ***Firearms in Criminal Investigations & Trials***, 2017, LexisNexis.

8.10.1 Nature

Gunshot residues are complex mixtures of materials produced in gunshot firing. Their composition depends upon:—

1. The nature of the formulations of the propellants and primer mixtures.
2. The composition of the projectile materials.
3. The barrel scrapings.

8.10.1.1 Black Powder Residues

Forty to 60% of the combustion products of black powders are gases and the rest are solids. The gaseous products are carbon monoxide, carbon dioxide, hydrogen sulphide, nitrogen, oxygen and water vapours. The solid residue consists of carbon, sulphates, carbonates, thiosulphates, sulphides and sulphites of potassium, unconsumed charcoal and sulphur.

The black powder is not used in modern ammunition. The evaluation of its residues is needed only in those cases which involve muzzleloaders or home-made black powder filled cartridges.

The primer mixtures contain mercury fulminate, antimony sulphide, antimony oxide and potassium chlorate. In some primer mixtures, potassium chlorate is replaced by barium peroxide, barium nitrate and lead peroxide. Likewise, mercury fulminate in some primers is replaced by a mixture of sulphocyanide of copper or lead, TNT, tetryl and sulphur. The primers contribute oxides of barium, antimony, copper, lead, potassium chloride and mercury to the gunshot residues.

8.10.1.2 Smokeless Powder Residues

The detectable inorganic materials in the GSR of modern smokeless propellants are:

1. Lead, from the bullets and the primers
2. Barium, from the primers
3. Antimony, from the primers
4. Copper, from the jacket
5. Iron from the barrels
6. Carbon monoxide, absorbed in the skin and the flesh, from the propellants
7. Nitrates, from the inorganic oxides and from the propellants
8. Nitrites, from the propellants
9. Zinc, from the jacket
10. Nickel, from the Nickel coating of the shells in some cases
11. Carbon particles

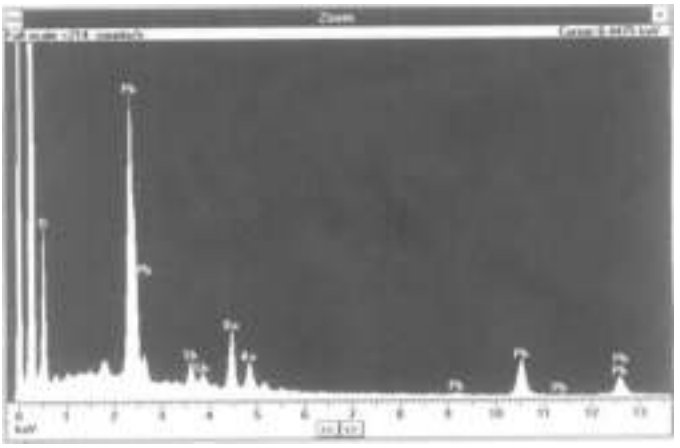

Fig. 8.21

Lead, antimony and barium from the GSR through EDX, with SEM. The presence of the elements is a sure indication of the GSR

The detectable organic components of the GSR, of smokeless propellants, are:

1. Nitro-cellulose, the unburnt or the semi-burnt part of the main component of the propellant
2. Nitroglycerin, the unburnt or semi-burnt part of the double base propellants, if used
3. DPA (Diphenylamine), used as a stabilizer, in all single base propellants. It constitutes roughly 1% of the propellant weight
4. Ethyl centralite, used as stabilizer, in double base powders (~1% by weight)
5. Phthalates, used as the plasticisers
6. Glyceryl triacetate, used as plasticisers
7. Nitroguanidine, used as plasticiser
8. DNT (Di-nitro toluene), used as flash suppressant
9. Bullet lubricants
10. Residual GSR constituents, from the barrel from previous firing

The smokeless propellants produce mostly gases. The gases are carbon monoxide, carbon dioxide, nitrogen, oxygen and water vapours. Oxides of nitrogen are produced if combustion is incomplete.

The solid residues, in addition to those mentioned above, are elemental carbon in a fine state called molecular carbon, potassium carbonate, chloride and antimonate. They are from stabilisers.

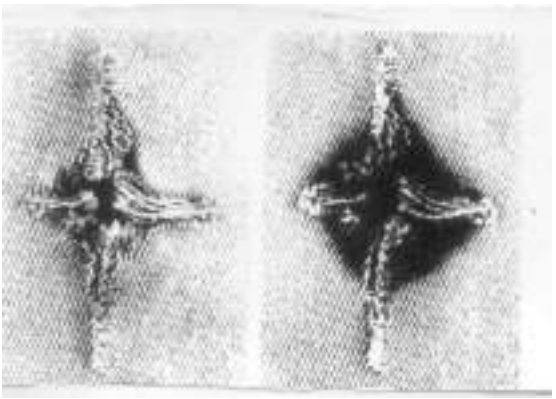

Fig. 8.22
Tear and smoke deposit on jacket

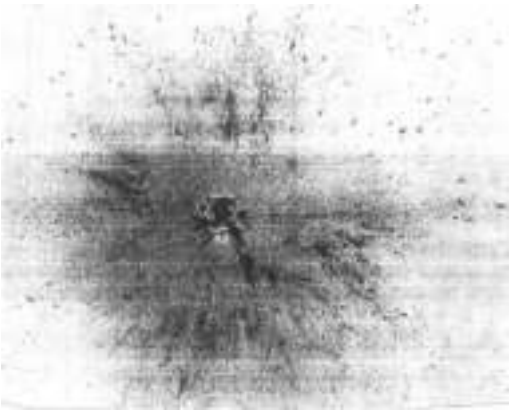

Fig. 8.23
Back-spattered GSR on the back surface of an intermediate target placed close to the main target

8.10.2 Importance

The examination and the evaluation of the GSR helps to solve a number of problems:—

1. Has the given gun been fired?
2. Has the given projectile/cartridge case been fired?
3. Did the suspect fire a firearm? In fake suicide cases, the question may be crucial.
4. Is the given wound a firearm injury?
5. Is the given wound/hole (on clothes, bones, furniture) a gunshot hole?
6. What was the firing range?
7. When was the given gun/projectile/cartridge case fired?
8. Is the given wound/hole an entrance/ exit hole?
9. Is the given incident of shooting a case of suicide/homicide/accident?

8.10.3 Location

The GSR is found on:

1. The hand(s), clothes, hair and face, of the shooter
2. The person standing near the shooter/victim
3. The objects at the shooting site; bedding, furniture
4. the air of closed rooms, if the shooting took place in a room
5. The area around the projectile entrance wounds/ holes, at the target (including clothes, exposed or affected skin,)
6. Around the exit wounds, in rare cases
7. In the internal track wounds in close range firing
8. The firearms – its inner and outer surfaces,
9. The fired cartridge cases
10. The fired projectile(s)
11. The articles around the target site
12. The intermediate targets.

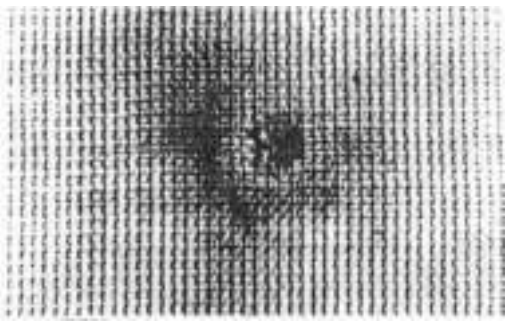

Fig. 8.24

IR photography reveals
GSR on dark cloth, indicating close range fire

8.10.4 Collection

There are a number of methods to collect GSR including the ones given below:—

8.10.4.1 Dry Methods

8.10.4.1.1 Wax

Wax of suitable melting point is melted in a vessel and gently applied to the hand(s) of the suspect with a brush until it acquires sufficient thickness (1 to 2 mm). It is allowed to set. It is then peeled off.

The peeled off wax cast picks up the GSR particles from the hand(s).

8.10.4.1.2 Cellulose Acetate solution

Cellulose acetate solution, in acetone, is applied to the site bearing the GSR. It is peeled off after the evaporation of acetone. The cast picks up the GSR.

8.10.4.1.3 Collodion solution

The collodion solution is sprayed on the site where the GSR particles are present. The film is rein enforced with nylon fibres. The film picks up the GSR It is peeled off, when the solvent has evaporated.

The re-enforcement prevents damage to the cast on normal handling.

8.10.4.1.4 Adhesive tape

Adhesive tape (or adhesive aluminium foil) is pressed, repeatedly, on the surface bearing GSR. It picks up its particles. The tape is kept in a vial with adhesive surface inside the vial, before and after the use. The tape is mounted on specimen stub for examination.

8.10.4.1.5 Acetic acid impregnated sheet

A cellophane sheet impregnated with acetic acid is pressed against the site. It picks up lead particles.

8.10.4.2 Wet Methods

1. A filter paper, moistened with dilute acetic acid, is pressed against the spot suspected to bear GSR particles. The paper picks up the particles.
2. The site bearing the gunshot residues is swabbed with a piece of cotton cloth, moistened with dilute hydrochloric acid (10%) or with nitric acid (5%). It picks up GSR particles. The swabs, from various parts of the hand, are collected separately.
3. The hands are rinsed thoroughly in dilute nitric acid (50 ml of a molar nitric acid is used) placed in a plastic bag. The solution obtained is freeze dried and the residue tested for GSR.
4. The residues in the barrel are collected by washing the barrel with hot distilled water. The washings are tested for GSR.

8.10.4.3 Collection of Organic Residues

The evaluation of the organic components of GSR has acquired tremendous importance. The following are the important collection techniques:—

1. *Swabbing*.—A small cotton wool ball, a clean cloth piece, or a filter paper is moistened with an organic solvent (acetone, ether or alcohol) and the site is swabbed. The swabs are collected and GSR is extracted and tested.
2. *Tape lifting*.—An inert tape of suitable width (2-3 cm) is taken and the site is taped. The tape is used as such, or extracted and the extract is utilised for further testing.
3. *Vacuum lifting*.—The techniques are especially useful to collect GSR from clothes. The material deposited on the filter disc is extracted with a suitable solvent for further processing.

8.10.5 Evaluations: Detection/identification

A lot of research activity to exploit the evidential potential of GSR is going on. Excellent techniques have come up to detect/identify/quantify GSR.

The following processes are used:

8.10.5.1 Visual Examination

If a firearm is discharged from a close range, visual examination reveals burning, blackening, tattooing and other manifestation of GSR. Their presence indicates a gunshot fire. A hand magnifier or a low power stereo microscope and a strong light source improve the detection of GSR. However, often the quantity of GSR deposits is meagre and visual examination does not reveal the GSR. The expert therefore uses other physical and chemical methods, including the following:

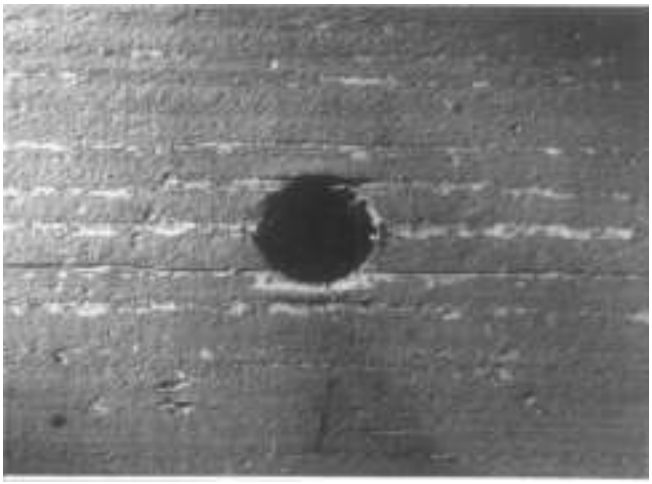

Fig. 8.25

No GSR around the clean hole in a wooden door: contact shot!

8.10.5.2 Infra-red Photography

Infrared photography proves useful if the GSR is on coloured clothes and the colour is masking their presence. The images of GSR come up in the IR photograph.

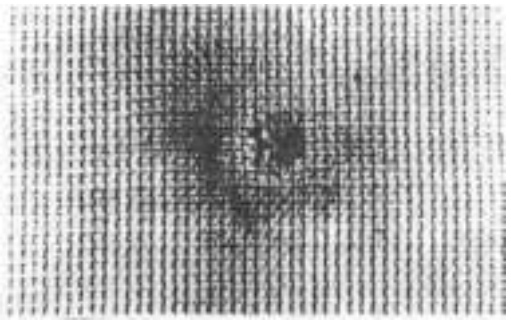

Fig. 8.26

IR photography reveals GSR on dark cloth, indicating close range fire

8.10.5.3 Soft X-rays Radiography

The lead metal is opaque to X-rays. Radiography reveals lead particles in the deposited GSR. A soft X-ray radiograph of the suspected area or hole reveals the radio opaque deposits in a characteristic pattern, indicative of a gunshot fired.

8.10.5.4 Chemical methods

There are many Traditional Chemical methods. Some of them are still in use because of their simplicity and ease. They include:

- Dermal Nitrate Test
- Walker's Test
- Spot test for lead.
- Harrison and Gilroy's Test.
- Price Spot Test.

8.10.5.5 Dermal Nitrate Test

Dermal nitrate test was frequently used prior to 1950, to identify the shooter. The test is simple. It identifies nitrates in the GSR. Nitrates are picked up on a paraffin wax cast as described earlier. The residues on the cast are treated with diphenylamine dissolved in strong sulphuric acid. The formation of blue colour spots indicates nitrates. They are, in turn, indicative of the presence of the gunshot residues.

The test is not specific to GSR. Many common materials give positive reaction with the above reagents. The test is no longer used.

8.10.5.6 Walker's Test

Walker's test is widely used even today. Its simplicity and greater specificity makes it a convenient test.

A desensitised glossy bromide paper is taken. It is treated with 2 naphthyl-amine 4:8-disulphonic acid (5%). The bromide paper is placed over a table with the treated surface on top. The cloth bearing the gunshot residues is placed over the bromide paper. It is covered with a towel moistened with 20% acetic acid and the arrangement is pressed with a hot electric iron for about five to ten minutes. Dark red spots appear on the bromide paper. They indicate GSR.

A modified version of the test is as under:

A piece of filter paper is moistened with acetic acid. It is pressed against the target surface. It picks up the gunshot residues. The filter paper is then sprayed with a solution of 2 naphthylamine sulfanilic acid and citric acid. The pink coloured specks indicate nitrite particles. They, in turn, indicate GSR.

The test is useful to:

1. Identify the bullet entrance holes and wounds.
2. Help to determine the range of fire.
3. Ascertain whether a firearm, bullet, or a cartridge, has been fired or not.
4. Estimate the approximate time of fire. The diminishing intensity of the colour formed is the indicator of the time elapsed.
5. Identify a shooter.

8.10.5.7 Harrison and Gilroy's Test

Harrison and Gilroy's test determines the presence of lead, antimony and barium through spot test.

The gunshot residues containing the metallic constituents are collected on a piece of cotton cloth (moistened with dilute hydrochloric acid) as described earlier. The cloth is, then, tested as under:

1. A dried piece of test cloth is treated with one drop of triphenyl methylarsonium iodide alcoholic solution (10%). The appearance of an orange ring, in about two minutes' time, indicates the presence of antimony.
2. The test cloth bearing the orange ring is dried and two drops of sodium rhodizonate solution (5%) are put in the centre of the ring. Red colour development, inside the ring, indicates lead, barium or both.
3. The test cloth is dried again. A drop of dilute hydrochloric acid (1 : 20) is placed on the red spot developed in (2) above. If the colour changes to blue, lead is indicated. If the colour does not change, barium is indicated.

The test is useful to identify a shooter or a bullet hole. The test is, however, not popular. It gives unstable colours. The three elements interfere with one another. The results are not quantitative.

8.10.5.8 Price's Spot Test

This technique involves the identification of lead through a standard spot test using, sodium rhodizonate solutions. The gunshot residues are collected from the hands on a piece of cloth moistened with 1% hydrochloric acid. The test does not offer any advantage over Harrison Gilroy's test.

8.10.5.9 Neutron Activation Analysis

The examination of gunshot residues by Neutron Activation Analysis depends upon the presence of antimony and barium. When the gunshot residues are exposed to neutron bombardment in a nuclear reactor, antimony and barium capture one neutron each to give radioactive antimony and radioactive barium

$$(Sb_{121}, Sb_{122})$$
$$(Ba_{138}, Ba_{139}).$$

The radioactive nuclides emit gamma rays. Evaluation of the energy and half-life help identify and estimate the isotopes. The estimation is usually done by comparing with the standards. Neutron activation analysis is a highly sensitive technique. However, it is cumbersome:

1. It needs a reactor for the neutron source, which is scarce.
2. It is time-consuming.
3. It needs a lot of pre and post-activation chemical treatment of the samples. For example, sodium and chloride ions from perspiration have to be eliminated for proper estimation.
4. The technique is not suitable for analysis of lead, which is the most important metallic constituent of gunshot residues.

8.10.5.10 **Flame-less Atomic Absorption Spectrometry**

An atomic absorption spectrometry is an extremely sensitive and convenient technique for the evaluation of the gunshot residues. It can detect the elements in nanogram and picogram ranges.

Atomic absorption spectrometry works on a very simple principle. An element absorbs the radiation of the same wavelength as it emits when excited. The suspected element (in gunshot residues) is taken into an atomiser (a graphite tube or a Tantalum strip) and is excited by heating. The radiation from a discharge tube with the suspected metal electrodes is passed through the atomiser. The loss of intensity in radiation gives the measure of the quantity of the metal in question.

The technique is useful and popular for the examination of the gunshot residues. It is less costly, consumes less time and is applicable for lead estimations also.

8.10.5.11 Scanning Electron Microscopy (SEM)

Fig. 8.27

A typical Scanning Electron Microscope
(with EDS detector, electronics console, and visual display monitors)

Scanning electron microscopy is the most impressive and effective method to evaluate the gunshot residues:

1. It photographs the powder residue particles at site. The specific shapes of the lead particles indicate GSR.
2. It provides elemental analysis of the elements in the powder residues.
3. The analysis is non-destructive in nature.
4. It gives the number of particles per unit area.

In scanning electron microscopy, a fine beam of electrons is focused on the material under study. The electron beam has the following effects:

1. **It generates X-rays;** the generated X-rays are used to find out the elemental composition of the material with an X-ray analyser. The X-rays are characteristic of the element.
2. **It gives cathode luminescence;** when the electron beam falls on certain materials, it creates luminescence, specific of the element(s) involved. The spectral analysis of the light indicates the elements involved.
3. **It creates backscatter,** some electrons are reflected back (backscatter). The photographs obtained from these electrons have 3-dimensional effect, which permits the topographic evaluations of the surface of the GSR particles in a much better way.

4. **It provides high magnifications/resolution;** SEM can give magnifications of the order of a hundred thousand (10^5) times with high resolution and thus, provides an excellent tool for the structural studies of the GSR particles on the surface.

The scanning electron microscopes have been introduced in most of the modern Forensic Science Laboratories. They should help to evaluate the gunshot residues more efficiently. The paraffin lifts, adhesive tapes, cellulose acetate or the collodion lifts are used to evaluate the gunshot residue under a scanning electron microscope. Characteristic spheroid shapes indicate the presence of lead globules. Identifications of antimony and barium, through EDX, make the identification certain.

The use of Scanning Electron Microscope in Forensic Ballistics has a profound impact on the entire field of Forensic Ballistics. It is because:

1. It gives a high resolution. It is about 300 times more than that in the optical instruments.
2. It has extremely high depth of focus. Thus, the images give 3-dimensional effect.
3. It has almost unlimited magnifications.

It is an instrument of choice for the examination of all sorts of microscopic surface characteristics involved in Forensic Ballistics. EDX, an accessory, has increased the utility of the instrument many times.

The working principle of the technique is simple. A beam of electrons is impinged on the surface. The extent, direction and intensity of secondary electrons emitted by the surface depend upon the surface structure/composition of the surface in question and the original beam. The secondary electrons scattered by the surface are utilised to build up the image of the surface.

The excellent discrimination qualities/sensitivity/specificity of the microscope is making it indispensable in the examination of:

1. marks on fired ammunition
2. GSR
3. Bullet marks/hoes

The scanning electron microscope requires a high vacuum (2×10^{-5} mm Hg). In the ordinary atmosphere, air absorbs the electrons. The exhibits, therefore, are placed in vacuum. They must also be non-volatile and good conductors.

The area of the sample, which can be scanned, is about 8 cm square. The positioning of the exhibited is done by remote control.

The magnification range varies from 5 X to 100,000 X. In forensic ballistics, the magnifications beyond 1000 X are rarely needed. The resolution of the order of 200 A is achieved at 50,000 X.

The scanning electron microscope has been programmed to search for the powder residue particles on the clothes of the victim or on the various lifts. Identification and analysis are carried out simultaneously and automatically. The work of the analysts has thus, been reduced considerably. Unfortunately, the cost of the equipment is high. It is not being used extensively in India. In prosperous countries the scanning electron microscope has become indispensable to the ballistics laboratories.

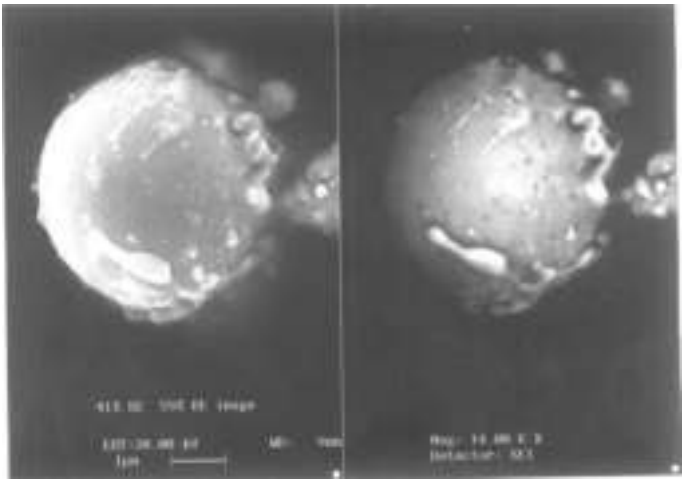

Fig. 8.28

GSR Particles Through SEM

8.10.5.12 X-Ray Fluorescence

Another method of choice for the analysis of GSR is the use of X-ray fluorescence. The technique has been extensively used to carry out both qualitative and quantitative elemental analysis of the residues. The comparatively low price of the needed equipment, the simplicity of the technique and of the operation, and the highly efficient results make it one of the most convenient methods for the evaluation of powder residues.

Autoradiography, photoluminescence, lead isotopy, emission spectroscopy and polarography have also been employed.

8.11 RANGE OF FIRE

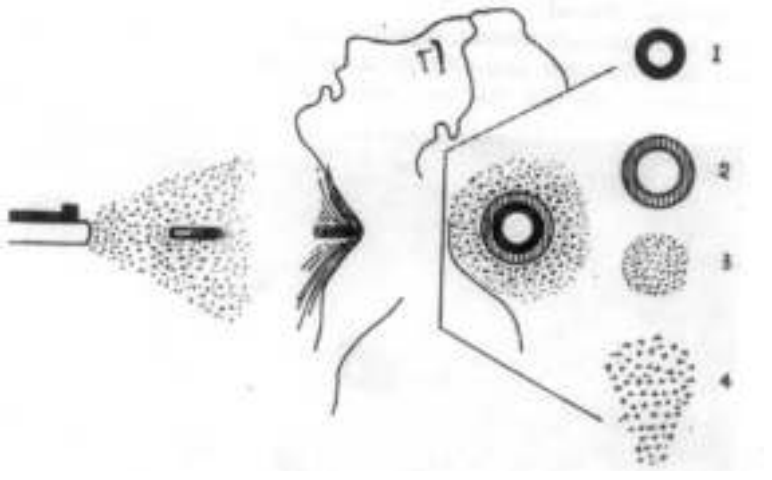

Fig. 8.29

The mechanism of formation of firearm injuries and of formation of extraneous deposits

Determination of the range of fire is an important aspect of forensic ballistics. If proper photographs, sketches, description of the injuries, the suspected firearm and the required ammunition are available, an accurate estimate of the range can be made. The following features are important indicators:

8.11.1 Muzzle Patterns

When a firearm is pressed against the human target and fired, the muzzle of the firearm leaves an imprint on the target. The existence of the muzzle pattern, therefore, indicates a contact wound. Such wounds are often observed in suicide cases. The whole charge (projectiles, wads, if any, smoke, unburnt or semi-burnt powder particles and hot gases) enter into the target. No burning, blackening, and tattooing phenomena are observed around the entrance hole. Instead, on careful examination, they are observed inside the wound.

If there is no space for the expansion on the gases inside, they come out through the entrance hole and in the process, they evert the edges and often tear the skin around the entry wound hole to give star-shaped tears. The novice often mistakes it for an exit wound.

8.11.2 Scorching

The flame and/or hot gases scorch/burn/singe/char the target sometimes. It is a close-range phenomenon. The range is a few centimetres in the case of pistols and revolvers to a few decimetres in the case of rifles and muskets. The flame and hot gases do not travel afar. The burning range depends upon the length of the barrel of the firearm and the age and the nature of the propellant charge.

Some persons believe that scorching, is caused by hot projectiles. It is not so as the projectiles do not get heated to temperatures at which scorching occurs.

Scorching/singeing/burning/charring is often confused with blackening, dirt-ring and the contusion caused by the impact of the projectile. Burning can be distinguished easily from blackening and dirt-ring. Swabbing the surface with spirit, removes the dirt and blackening while charring remains. Contusion-ring is distinguished from the burning effect through its shape and microscopy of the skin and flesh. The contusion is in the form of a regular round or oval ring, burning is irregular, comparatively. It is especially so if the weapon has flash holes.

8.11.3 Blackening

Blackening around the wound is caused by the deposition of smoke particles by all types of powders at close ranges. The intensity is maximum in the case of gunpowder, less in semi-smokeless powder and least in smokeless powder with the same quantity and from the same range. The colour also varies slightly. It is black in gunpowder and greyish black in smokeless powder.

Smoke particles are formed due to the burning of the powder charge. They are propelled along with the projectile charge. Being light particles, they soon lose their velocity and deposit on any object which comes in their way. The blackening range is roughly three times the burning range.

8.11.4 Tattooing/peppering/stippling

In tattooing (also called peppering, stippling) unburnt or semi-burnt powder particles embed into the surface of the target. These particles are slightly heavier than the smoke particles. They, therefore, retain motion to somewhat longer distance. Tattooing range is, therefore, is longer, about one andahalf times the blackening range.

The age and quality of the propellant affect the range and density of tattooing.

8.11.5 Powder Residues

The amount of GSR left at the target is predominantly dependent upon the range, though arm and ammunition are also important factors. The expert performs experiments with the same arm and similar ammunition from various ranges, close to the estimated range of the crime deposit(s). He gets fairly accurate range by comparing the crime and test deposits.

The maximum powder range in handguns is about one meter. It assumes great importance in determining the real or fake nature of an alleged suicide.

8.11.6 Metal Particles

Metal particles produced by lead fouling and scraping of the projectiles form part of the ejected GSR. They, being heavier, travel to a longer distance than the powder or smoke particles range. The range up to which these particles travel varies with the firearm and the ammunition, particularly on the size of the metallic particles of the fouling.

The particles are, ordinarily, not visible to the naked eye. They are detected by soft X-rays or by chemical tests.

8.11.7 Wad Distribution

A number of wads are found in the older version of the shotgun ammunition. They are projected along with the other ejecta. They enter the target up to about three metres. If they are not obstructed, they scatter from five metres to about ten metres or more. The distance between the victim and the wads is used to estimate the range of fire. Test firing with the suspected firearm and similar ammunition provides better approximation of the range.

The weather conditions have an important effect upon the scattering of wads. They may be blown far away or retained near, depending upon the direction and velocity of the wind at or immediately after the time of firing. The weather is, therefore, taken into account for the determination of the range of fire from wad scattering at the scene. The cushion wad being heavier goes to much longer ranges than the other wads. In power piston wads there is one moulded wad which separates the charges, seals the barrel and protects the projectile charge. It is made of plastics and is heavier. It goes to considerable distances. Its position at the scene can provide guidance to estimate the range.

8.11.8 Pellet Patterns

The area covered by pellets fired from a shotgun is proportional to the distance between the muzzle of the firearm and the target. Greater the range, greater is the area covered. The spread is affected by the length of the barrel of the firearm, the choke characteristics of the muzzle of the firearm (whether choked or not, the degree of choke) and the condition of the ammunition. Test experiments with the suspected firearm and corresponding ammunition (make, batch, pellet size), give pellet patterns which provide a fair estimate of the range. The following general information may be useful to all concerned:

1. Generally, in a standard shotgun, the whole charge enters the body *en masse* up to a range of about two metres, forming a rat-hole varying in diameter from about two centimetres to about six centimetres, depending, mainly, upon:
    1. The distance between the muzzle and the target,
    2. The constriction (choke) of the muzzle, and
    3. The size of the pellet charge.

2. There is a rat-hole surrounded by individual holes from two metres to about seven metres.
3. The individual shot may form its separate hole from a range of three to four metres in buckshot charge.
4. The separation of the holes is usually complete from about ten metres onward, especially in buckshot charge.
5. The spread of pellets at various ranges with different degrees of chokes is given below for rough estimation:

Table 8.2

Pellet spread varies with range and chokes

Range in Metres	**Pellets spread; circle diameter in cm**			
	True Cylinder	Improved Cylinder	Half Choke	Full Choke
10	54	38	31	23
15	71	55	44	33
20	88	72	58	45
25	105	89	73	59
30	122	106	90	75
35	140	124	108	94

The above table is not applicable to improvised pistols and guns made by local blacksmiths which do not conform to any specifications. The barrels are either too loose or too tight. The lengths of barrels are often short. The inner surface is rough. Consequently, the pellet patterns are not only different from standard firearms, but they vary from one shot to another in the same firearm. These firearms do not lend themselves to reliable range determinations.

For standard firearms, with half choke, a rough idea of the range is obtained from the formula:

D = 3 R; here:

R = range in metres, and

D = diameter of dispersion in centimetres.

8.11.9 Direction of Wound

If the direction of the wound is not parallel to the ground level and the angularity is not due to deflection of the projectile inside the body, a fairly accurate estimate of the range of fire can be made. At least, the prosecution or the defence story of the occurrence can be verified.

In an appeal against the conviction against murder, the defence challenged the prosecution version of the occurrence. The deceased had been killed by pistol fire from across the ten feet (~ 3 m) wide street. The victim and the accused were standing on their respective roofs, which were at the same level. The wound of exit was five centimetres higher than the entrance wound level.

The defence produced a bust and a long probing rod. They tried to prove that the line of fire met the roof level at about two metres from the position where the victim was standing. They argued that the deceased, therefore, could not have been killed by the accused who was, at least, a metre away from where the line of fire met the roof level.

A careful study of the height of the deceased and accused, position of entrance and exit wounds and the thickness of the body revealed both mathematically and graphically that the killing was possible from across the street.

The High Court asked the author to verify the facts and the reconstruction of the defence. The defence in their demonstration had made errors by decreasing the body thickness and increasing the height of the exit wound, thus increasing the angularity.

The sentence was maintained. (CH)

8.12 FIREARM INJURIES

Medico-legal experts examine the victims with firearm injuries. The firearm expert has to evaluate them frequently. If each performs his function well and sticks to his field, no trouble arises. If they cross into each other's territory, there is often confusion. It is, therefore, desirable that they understand their roles and perform them well.

The correct evaluation/appreciation of firearm injuries is essential in reconstructing a shooting incidence. The burden of firearm expert testimony is increasingly shifting from the identification problems of firearms and fired ammunition to the reconstruction of the sequence of events to verify a given hypothesis. Is it suicide, accident, murder or killing in self-defence? Only correct evaluation/appreciation of firearm injuries can reveal the true picture of the occurrence.

8.12.1 Nature of Firearm Injuries

Ordinarily, a firearm injury has three parts:

1. The entrance wound,
2. The exit wound, and
3. The internal wound

In some cases, when the projectiles are retained inside the body there are no exit wounds. Sometimes the entrance or exit wounds are invisible. Here, the projectiles enter or go out through the natural orifices (openings) like mouth, anus, Cleavage of tissues may start or end at a hidden place.

Some years ago, the author attended the post-mortem examination of an assistant sub-inspector. Some unknown culprit(s) had shot him dead with a rifle. The projectile had entered the back of the neck. There was no visible exit wound. The medico-legal expert thought that the projectile must be inside the body. However, thorough X-ray screening did not reveal any projectile in the body. On the suggestion of the author, the wound was probed. The forward end of the probe came out of the mouth. The Medico-legal expert checked the mouth. He found lacerated mouth/broken jaws/teeth. The absence of the projectile could then be understood. It had escaped through the mouth. (CH)

Firearm entrance wounds may be circular, oval, key shaped, ragged or explosive. The last category (sometimes confused with wounds caused by explosives) is caused usually by high velocity projectiles or by shotgun fire from a close range when the whole ejecta enter the body at a point where there is no space for the expansion of the gases.

Ordinarily, the entrance wounds have smaller diameters than the diameters of the projectiles. Sometimes they may have equal or larger diameters even. However, the later formations are rare.

The exit wounds are frequently irregular, occasionally circular and at times gaping. The dimensions are, ordinarily, larger than those of the entrance wounds or the diameters of the projectiles causing the same.

The internal track may be a straight tunnel, or it may be zigzag due to deflection of projectile. Sometimes the track is multichannel due to fragmentation of the projectile or due to the formation of secondary projectiles.

The track may end inside the body. The projectile causing the injuries is found at the end of the track.

At times there is a small entrance wound approximately equal to the diameter of the projectile but inside a tunnel, many times larger than the diameter of the projectile is discovered. The exit wound is also much larger than the size of the projectile. Lacerated and damaged flesh, muscles, bone pieces, blood clots, protrude from the exit wound like lava at the crater of a volcano.

Firearms sometimes cause extraordinary injuries: incisions, abrasions, contusions, They do not have the usual three parts. They are sometimes confused with injuries from weapons other than firearms.

8.12.2 Wound Ballistics

When a projectile strikes the human body, it depresses and compresses the skin, flesh and bone tissues underneath the hit site. The continued pressure stretches them beyond the elastic limits if the projectile has sufficient energy. The projectile then pierces the stretched skin and enters into the body. The hole on the skin appears smaller than the size of the projectile which created the wound as the stretched skin bounce back to its original position.

The minimum velocity, known as threshold velocity, required to penetrate the skin is 40-50 m/s. The threshold velocity for bone penetration is about 60 m/s.

The projectile continues its onward progress until it leaves the body through an exit wound; or, if its kinetic energy is spent in overcoming the resistance offered by the clothes, skin, flesh and bones before it reaches the exit point. The projectile is found lodged inside the body in such situations.

Wounding effect of a projectile depends upon:

1. The target site,
2. The velocity,
3. The constructional features, and
4. The range

8.12.2.1 The target site

A human body is not a uniform medium. It is about 80% water. But it is not uniformly distributed. At places, there are bones, at other places, veins, nerves, muscles or blood vessels. Thus, the vulnerability is unevenly distributed. Skin covers them.

The total surface area of the outer skin of a human body is about 5000 cm^2. Careful considerations of the anatomy of the human body, reveal that about 43% of the total area (about 2150 cm^2) covers body parts (organs, cavities, nerves, blood vessels,) which are prone to easy damage. A projectile, hitting these parts, causes serious injuries.

Anatomical evaluations reveal that the average depth of protective tissues on the frontal side of the body is 0.6 cm, whereas it is 3.3 cm on the backside (> 5 times than that of the frontal

tissues). Thus, a frontal attack is likely to cause more serious wounds than the injury from the backside. The difference in wounding effect will be apparent dramatically only when the velocity of the projectile is around the threshold velocity.

Ordinarily, the velocities of the projectiles hitting the body are far above the threshold velocities in real crime situations. The protective tissues thus, do not play a significant role in shooting cases. They do help in the cases of attack with other weapons.

The body part hit by a projectile necessarily plays an important part. If a projectile cuts the skin only, it does not do much harm. Likewise, a projectile may hit a finger or a toe of a person without the latter being very much the worse for it. However, if a shot injures the brain, the heart, the spinal cord or aorta of a person, the person is disabled (stopped) almost at once. Often the injury is fatal. It is against this background that the elephant hunters try to reach the brain of the game, aiming at the area in between the ear and eye. The area is a circle of the diameter of about ten centimetres only.

Firearm injuries often cause shock. The main reasons/modes of shock are:

1. Loss of blood due to injuries
2. Hydrostatic pressure on a vital organ due to high velocity bullet impact in its vicinity[13]
3. Extreme fright
4. Weak heart

The shocking power of a projectile varies from person to person. This explains the extreme bravery shown by Pathans in Anglo-Afghan Wars. The British used Mark VI .303 ammunition/ projectiles. The bullet had effective velocities of less than 600 m/s. They did not cause explosive wounds. Consequently, the projectile did not cause sufficient shock (in physical sense). The Pathans though hit at non-vital parts, continued fighting.

8.12.2.2 The velocity

The velocity of a projectile has great influence on the nature and extent of body tissues damage. The energy of a projectile formula (**$E = l/2\ MV^2$**) explains it all.

The energy is proportional to the square of the velocity. If we double the velocity, the energy of the projectile becomes **Four** (4) times, if we treble the velocity the energy of the projectile becomes **nine (9)** times. This extreme influence of the velocity is, therefore, too evident to need further comment.

The wounding effect, on velocity considerations, has four velocity zones:

1. Velocities less than 400 m/s
2. Velocities from 400 to 600 m/s
3. Velocities from 600 to 1100 m/s
4. Velocities beyond 1100 m/s.

8.12.2.2.1 Velocities less than 400 m/s

In this velocity zone, no abnormal wounding phenomenon is observed. Usually the projectile does not fragment or deform to any appreciable extent unless it strikes a bone. The extent of deformation and deflection, if any, is depends upon the resistance the target imparts.

13. For details, see author's book: ***Firearm in Criminal Investigation & Trials***, LexisNexis, 2017, p 360.

8.12.2.2.2 Velocity zone 400-600 m/s

The projectile in this velocity zone behaves midway between similar projectiles of first and the third velocity zone. Lead bullets and expanding bullets start mushrooming. The extent of mushrooming depends upon the striking velocity, the constructional material and features of the projectile and the resistance offered by the target site. The tissue damage is greater, because the cross-sectional (also called projection area) increases as the projectile progresses forward. The projectile may or may not remain inside the body. If it goes out, the exit wound is larger than the entrance wound or the diameter of the projectile.

8.12.2.2.3 Velocity Zone 600-1100 m/s

Projectiles in this velocity zone show dramatic (and important) effects. They produce explosive wounds. For the formation of explosive wounds, the following explanations are given:

1. The high velocity projectile creates a vacuum behind it. As it enters the body, the air behind rushes in at a terrific speed and disrupts the body tissues.

   The explanation alone is not quite sufficient. The explosive wounds are caused even on targets kept and fired at in a vacuum.

2. The body parts hit by the projectile themselves become effective secondary missiles and cause extensive damage to the body.
3. The projectile fragments and these fragments cause extensive injuries.
4. The gyratory motion of the projectile is very high. A .303 Mark VII bullet, at the muzzle, spins at the rate of 300 revolutions per second (rps). The loss of revolutions is not more than 10% per second. The tissues, which come in contact with the projectile, are set into motion and churned. These tissues are torn off the adjoining tissues. The process inflicts injury on the tissues far beyond the immediate vicinity of the main track of the projectile.[14]

   Gyratory motion alone cannot be responsible for explosive wounds as experiments with small non-spinning spheres produced explosive wounds. However, it is well established that the wounding effect of a rotating bullet is far more extensive than that of the non-rotating bullet. This is because the projection area of the projectile increases with increasing distance. The deviation tendency (called 'yaw') is 800 times more in body tissues than in air. The projectile after a short passage in the tissue (say 5 cm) may be slanted by 50° to 90°. Thus, the projection area (area of the bullet touching the body tissues) will be increasingly more than the area when it is travelling in nose-onward position. The transfer of energy is, therefore, far more. As the damage is directly proportional to the energy transferred the rotating bullets cause much more damage than the non-rotating bullets.

5. Experiments with high velocity projectile fired in water, gel block, anaesthetised animals and cadavers have cleared the mechanism of the "explosive effect" of the injuries caused by high velocity projectile to a great extent.

The main effects of high velocity projectile, in its journey through the body are:

1. The projectile compresses the frontal air. It starts a shock wave. The intensity of the shock wave depends upon the velocity of the projectile and the energy transferred by the projectile to cause the shock wave. A projectile (0.5 cm diameter steel sphere) with a velocity of 1000 m/s causes a shock wave which compresses the target with

14. Due to hydrostatic pressure (New explanation).

a pressure of about 45 atmospheres (46 kg/cm^2) which alone is sufficient to kill a person. The shock waves are repetitive, but the intensity falls off almost immediately. The shock wave pressure falls off rapidly with time and distance.

2. A temporary cavity is formed which is many times larger than the size of the projectile causing the same. Its size depends upon the total energy transferred by the projectile. It has been calculated that the volume of the cavity is 7.85 cc/metre kg of the energy transferred by the projectile to the tissues. The volume is about 27 times the volume of the permanent cavity. This cavitation is responsible for breaking bones and tearing muscle far away from the path of the projectile.
3. The temporary cavity collapses after the passage of projectile, in a short time but due to inertia it pulsates and it is only after a few pulsations that the temporary cavity finally comes down to permanent cavity but in the meanwhile extensive damage has been caused to the tissues.
4. The major damage to the tissues is caused by the fast moving projectile which compresses and cuts the tissues in front and on the sides causing the permanent cavity and the extravasation of the tissues along the permanent cavity. The cut tissues are thrown away from the track, while, the compressed tissues are violently thrown against other tissues and are badly lacerated. These body tissues form the extravasated zone. The volumes of the permanent cavity and zone of extravasation are 0.32 cc. and 3.75 cc. for every metre-kilogram energy transferred.

Service and sporting rifles cause "Explosive" wounds usually when the striking velocity is more than 600 m/s.

8.12.2.2.4 Velocity Zone above 1100 m/s

In this (fourth) velocity zone the projectiles have velocity above 1100 m/s. Such ammunition is not commonly used in crimes. The author has not come across them in his long career in Forensics. Consequently, the details of the wounding effects of such projectiles are not available. However, it is mentioned that the effect of the projectile on the game is instantaneous death—as if the game has been struck by lightning.

> *In a reported case, a projectile travelling at 1100 metres per second hit a prairie dog in the right front paw. It killed the dog instantaneously(CH).*

A modern cartridge develops high velocities when the propellant charge burns in a confined space. The barrel provides the confined space once it is 'sealed' by the projectile or cushion wad.

The projectile is pushed out of the cartridge case as soon as the pressure inside the cartridge case is sufficient to open the mouth. This pressure ordinarily is insufficient to propel the projectile at a velocity sufficient to kill persons. If such an accident is reported, it is probably fake. Murder lurks behind the story.

8.12.2.3 The constructional features

The constructional features of a projectile have profound influence on the wounding effect. The main determinants of the features are:

1. Proper penetration and
2. Adequate transfer of bullet's energy for tissue damage

Proper shape and structural materials of a projectile are important factors for the penetration of the projectile, in addition to another factor.

The ideal projectile, to overcome air resistance, is streamlined bullet. It has pointed ends on both sides. They reduce friction promotes penetration. However, the manufacture of such bullets needs extreme care. The centre of gravity must coincide with the centre of the shape (form). If the two are separated even by .0025 centimetre the projectile will strike about 25 centimetres away from the target at 600 metres. Besides, they pass through the body without transferring adequate amount of energy to damage the tissues. The stream-lined bullets, therefore, are not used in actual practice.

The boat-tailed shape has been found for most of the projectiles. The bullets have flat base and pointed nose (spitzer nose). These projectiles have excellent penetration power.

The bullets usually have a lead core. It is covered with comparatively hard metal, like copper. The lead core gives proper sectional density to ensure proper ballistics. The envelope ensures proper penetration. Many variations of the bullet materials and shapes are current. For example, bullets have soft nose. It may be hollow, exposed, crosscut; or, made of softer metal (Aluminium).

The jackets which envelope the lead cores may have different thicknesses at different parts of the jacket. Such projectiles are called expanding bullets. They expand on striking and cause serious wounds having almost immediate shocking and stopping powers.

The expanding projectiles include soft nose bullets also. They are not intended to be used against human targets. However, not only criminals use them but even the military of all the countries, including India, have adopted expanding bullets for their military ammunition.

> *In the famous Kairon*[15] *murder case, one of the victims was hit with a soft point high velocity projectile. It hit the person on one side and created an exit hole on the other side. The whole mass inside appeared to have been torn out. The exit hole was several centimetres in diameter. Only the jacket found stuck in the spine was recovered which was linked to the suspect rifle of the culprit. (CH)*

The constructional features of bullets have undergone a sea change. The modern service and assault rifles of the world usually have:

- Smaller diameter (~5.5 mm)
- High velocity (> 900 m/s)
- Full jacket
- Soft point nose
- Steel core alone or along with lead core in some service rifle ammunition

They cause devastating wounds. For example, M16, USA service rifle bullets expand so much (they virtually explode) in the body that the tiny lead fragments give the appearance of a snow storm on a radiograph (X-ray photograph).

8.12.2.4 The range

The increasing range of fire in addition to reducing the velocity of the projectile, influences the wounding effects in the following ways:

1. The lighter ejecta is dispersed. It does not reach or enter the target.
2. The initial instability of the projectile vanishes.

The powder gases, smoke, semi-burnt or unburnt powder residue, metallic particles, dirt and wads, if any, constitute the lighter ejecta. They are important in the wounding effects

15. Partap Singh Kairon was a chief minister of Punjab for a number of years. He, along with 3 companions, was murdered on Ambala-Delhi National Highway.

only when the firearm is fired, pressed to the skin (contact wound) or from very close range (near contact wounds). Under these conditions, the ejecta enters the body *en masse*. The expansion of the gases takes place inside the body. The wound has the following characteristics:

- The damage inside gives the appearance of an explosion. The damage may not appear so extensive outside.
- Often there is no charring, blackening or tattooing on the outer margin of the injuries. The phenomena are seen inside the wound.
- The out coming gases evert the margins. The injury may look like an exit wound. Sometimes, the damaged or undamaged organs (like the intestines) may protrude from the wound.
- If the wound is at a place where the skin is close to the bone, some powder gases may enter in between the skin and the bone and tear the skin in a characteristic fashion to give a star-shaped ragged wound. The bone, in addition to crater formation suffers from multiple fractures.
- The shot charge will spread inside the body though there is only one entrance hole.
- Wads of a shotgun can inflict fatal injuries from close range.
- The blast gases (without projectiles) from the firing alone may cause fatal injuries in contact/near contact shots.

The instability of the projectile in the initial stages of its flight on the nature of the wounds has profound effect. The wobbling projectile may not strike the target in nose-onward position. Instead, it may strike in side-onward position, producing what is known as 'keyhole' wound. If the projectile ricochets or brushes against some light material, it may also produce keyhole at the target.

The extent of the instability of a projectile depends upon a number of factors dependent not only on the projectile, but also on the firearm and the cartridge.

8.12.3 Identification

The necessity of identification of firearm injuries may be evident from the following cases:

1. *In a murder trial, a number of injuries were found on the thigh of the 'victim' who had allegedly killed the deceased in self-defence. The injuries were circular holes; 3 mm. in diameter and about 2 cm. deep. The pellets had allegedly bounced out of the holes after striking the bone.*

   The author informed the court about the impossibility of the pellets bouncing out from 2 cm deep flesh and the that the injuries were fake. The defence story was disbelieved, and the "victim" was later convicted for murder. (CH)

2. *In a multi-murder case, the convicted persons filed an appeal on the plea that the eyewitness on whose evidence they were convicted, was not present at the scene.*

   The presence of the eyewitness had been proved by the prosecution through firearm injuries, which he had allegedly received at the scene. The doctor had extracted some pellets from the wound. The extracted matter proved to be sand and grit. The injury was probably fake (or, was the extracted material switched?). The High Court believed that the injuries were fake and acquitted the convicted persons. (CH)

3. *Some years ago, a culprit faked an injury on his person and produced himself before a doctor. The doctor after examining the injury extracted buckshot. He informed the police. The police registered a case under section 307 I.P.C. The culprit was allegedly an unknown person.*

After a few hours, the police found a dead body in the same village to which the first "victim" belonged. General inquiry by the police indicated that the deceased and the 'victim' were dead enemies.

The investigating officer suspected that the "victim" probably was finding a fool proof alibi. *It proved true. The buckshot extracted from the injured had never been fired from any firearm. (CH)*

4. *In a murder case the doctor recovered two pellets from the victim. The pellets had flat surfaces. There were six flat surfaces in three pairs on each pellet. In each pair the two surfaces were parallel. It could happen only if the pellets were hammered by changing the hammering position thrice in each case. The injuries were consequently fake. (CH)*

Firearm injuries are identified either from the extraneous deposits or from the characteristic damage produced by the shots.

Extraneous deposits include absorption of carbon monoxide, blackening, tattooing, dirt ring, wads, projectiles or their fragments.

Characteristic damage includes burning (also called charring or scorching), contusion, characteristic through and through wounds, and special wounds such as explosive wounds, ragged wounds, rat holes,

The medico-legal expert performing the post-mortem examination knows the above facts. They help in the correct evaluation of the firearm injuries. They are important in the reconstruction of crime also. All those who are concerned with the dissemination of justice should know/understand them.

Fig. 8.30

The case of hammered pellets. The fraud of the alleged 'victim' was revealed by the presence of 3 pairs of parallel surfaces

8.12.3.1 Pink Coloration

If a shot is fired from a very close range or in contact with the skin, some carbon monoxide (produced in the combustion of propellants) gets absorbed by the skin and flesh around the wound. It gives pink colouration, which indicates a firearm injury from contact/near contact range.

8.12.3.2 Blackening

Smoke deposit, in a close-range firing cause blackening. Smoke particles are light. They do not travel afar. Therefore, smoke deposit, *i.e.*, blackening is limited to a short range. The range determinants are:

1. **Black powder** gives denser blackening and to a longer range than semi-smokeless /smokeless propellants. The quality, quantity and age of the powder influence the intensity of the blackening .
2. **Firearms** in which combustion is not complete and proper give denser blackening.
3. **Ammunition** deteriorates with age. Old ammunition consequently gives more smoke and hence denser blackening.

All types of ammunition, including one containing smokeless powder, give smoke. The colour of the smoke deposit is grey though it may look blackish grey in black powder and light grey in smokeless powder. Blackening does not mean an intense black deposit of carbon particles.

In a murder trial, the defence counsel cashed upon the ignorance of a medical witness. The Medico-legal expert found blackening around the wound, which he believed to have been caused by black powder (and not by smokeless powder). He stated so, in cross-examination. The cartridge involved contained smokeless powder, while the counsel got confirmed from a ballistics expert.

The counsel argued that:

- *The injury on the victim was caused by a cartridge containing black powder.*
- *The suspect cartridge case recovered by the police, contained smokeless powder.*
- *The suspect, therefore, could not be the culprit.*

He got an acquittal for the accused in the trial court.

The State went in appeal. The High Court called in author to assist.

The author fired test cartridges of the same make and batch containing smokeless powder from the alleged distance with the crime firearm. They caused blackening even when the brown paper target was covered with the clothes worn by the deceased.

The *test targets sheets were produced in the court. The court set aside the acquittal and convicted the accused. (CH)*

8.12.3.3 Tattooing

Tattooing is also known as peppering or stippling. It is the deposit of unburnt or semi-burnt powder particles under the skin. The particles are slightly heavier than the smoke particles. They are propelled to slightly longer distances.

Tattooing, ordinarily, cannot be removed by swabbing.

8.12.3.4 Dirt Ring

The projectiles may carry grease on them. Grease attracts dust/dirt and gets collected on. It is deposited around the wound, when they enter the body, to give dirt ring.

In shotgun ammunition, shots are rubbed with graphite. A small amount of graphite remains adhered to the shots. It is deposited around the wound to give dirt ring, when they enter the body.

Dirt may be picked up by the projectile while passing through a medium (clothes or mud walls), or, in ricochet, from the surface from which the projectile has ricocheted. This dirt is deposited around the entrance hole.

Existence of a dirt ring indicates that it is an entry wound. It does not indicate/give range.

8.12.3.5 Foreign Materials

Projectiles or their fragments and sometimes wads are found inside the body. Their presence not only permit the identification of the firearm injury, but they also permit a fairly reliable guess of the firearm and the range.

*In Kairon murder case,(*supra*). However, it was possible to determine the nature of the firearms used in the murders from the projectiles and their fragments recovered from the victims. A .32 revolver, a .38 revolver, a .30 rifle and a 12-bore shotgun were used to kill the four persons. (CH)*

8.12.3.6 Charring

Charring (also called scorching, burning, singeing,) is caused by flame or hot gases produced in the combustion of powder. The same is found in shots fired from very close ranges. The site, the shape and the extent are characteristic. Charring produced by firearms can be distinguished from burning by other modes.

Charring is often confused with blackening, tattooing, dirt ring or even contusion rings and they are described as charring. In charring, the body tissues are affected by heat. The effects are different. Blackening can be removed with a cotton swab. Charring cannot be removed in this way. It is distinguished from other phenomena by careful physical and microscopic examination.

8.12.3.7 Contusion

The edges of a wound are contused by the impact of the projectile. The colour of the contusion is from reddish dark to bluish black. The colour varies somewhat with the age of the injury.

Contusions take the form of a belt (ring with some width) around the wound. It is of uniform width in circular wounds.

The contusions are differentiated by microscopic examination of the tissues. The tissues are ruptured and swollen (extravasations). There may or may not be any extraneous deposit.

8.12.3.8 Characteristic Wounds

Through and through wounds, ragged wounds, rat-holes, explosive wounds and key holes, by their characteristic nature, allow, in most of the cases, determination of the fact that they have been caused by firearms.

8.12.4 Post-mortem Reports

The medico-legal expert carrying out the medico-legal examination acquires the knowledge about the injuries *in situ*. He observes the characteristic deposit and damage for the identification of firearm injuries. Others, who are vitally interested in the study of the firearm injuries, the court, the counsels and the firearm expert, do not and cannot always observe the injuries on the victim. They depend upon the Medico-legal expert for the information. They need thorough description along with graphics/photographs/illustrations/sketches Unfortunately, they have often to go only by the scanty descriptions the expert gives.

The method of recording and collecting firearm injury evidence must undergo substantial improvements if the non-Medico-legal experts are to identify and evaluate firearm injury properly.

The courts including the counsels are well aware and accept the definite nature of the firearms- fired ammunition linkage. They seldom question its validity. Now, the burden on the firearm expert is to

1. Identify the firearm injuries
2. Indicate the nature and calibre of the firearm used to create the given injuries.
3. Verify a given hypothesis, whether the incident is a case of Murder? Suicide? Accident? Self-defence?
4. Ascertain the sequence of events.
5. Find the range and direction of fire,?

Consider the following cases:

1. *The injuries on a deceased were a rat-hole about 5 centimetres in diameter and a number of small orifices surrounding it. The alleged distance of fire, for the only shot fired was about 8 metres. Certain books on medical jurisprudence indicated that separate holes for separate buckshot are formed from 4 metres onwards. The defence counsel argued that small orifices might have been caused by the shot fired by the accused but the main injury – the rat hole – the killing shot – must have been created by some other person. The accused is, therefore, not the murderer according to the prosecution evidence itself.*

   Is this argument correct? (CH)

2. *The accused fired as per observed by the eyewitnesses, two shots. The medico-legal expert said that four shots were fired at the victim. If they were four shots, two shots must have been fired by some other person. This second person could have caused the fatal injuries.*

   Why prosecute the accused alone? (CH)

3. *A dead body was discovered in a jungle. A shotgun and a bandolier were lying close by. The person had one entrance wound in the right iliac region. The injury had gone steeply upward at an angle of about 45^0. The charge of a 12 bore cartridge was found lodged near the left armpit inside the skin. The relatives alleged murder.*

   Could it be suicide or accident? Or, was it murder, as alleged? (CH)

Fig. 8.31

Was the victim shot twice or four times? Extensive experiments showed injuries 1 to 4 were results of one shot

The above types of problems relating to firearm injuries crop up frequently in firearm-related deaths. The in-depth evaluations of firearm injuries are acquiring increasing importance. It is, therefore, essential that all the data collected is correct and complete. It is possible if:

1. The firearm expert visits the crime scene.
2. He attends post-mortem to observe the injuries, including internal track, suggest extraction of projectiles without further mutilation and to help proper appraisal of the close range phenomena and the effect on the injuries on the injured organs and the reconstruction of the occurrence.
3. Only qualified/experienced Medico-legal experts carry out medico-legal work.

4. The Medico-legal expert has some training/familiarity with forensic ballistics and firearms. Every Tom, Dick and Harry, as is the practice in most of the states today, should not do post-mortems. Only qualified medico-legal experts should handle medico-legal work
5. All the states appoint police surgeon, medico-legal experts to do the job as has been done in some states.
6. The medico-legal examiners appraise/record the injury evidence themselves, keeping in view the following:
   - Locate the projectile(s) through X-ray screening/radiography of the victims before post-mortem examination.
   - Collect/preserve the clothes of the victim and send them, in all cases, to firearm expert; properly packed and transported in such a way that the evidence on the clothes is not destroyed/detached/mutilated or contaminated.

     In a murder case, some injuries on the deceased were skin deep only. The defence counsel argued that it was so because the projectiles (buckshot) had spent their force as they were fired from a distant range.

     The facts contradicted the version. The eyewitnesses were certain that shooting was from a distance less than three metres. When the clothes were examined, not only exit holes gave away the lie, but the presence of nitrite particles around the entrance holes indicated a close range. The injuries were skin deep only because some shots had only grazed the skin and flew away. (CH)
   - Photograph, along with a scale, all the firearm injuries before/after cleaning. Send the washings to departmental Forensic Science Laboratory.
   - Discriminate contusion, dirt ring, blackening, tattooing and scorching by chemical and microscopic examination. Record the findings.
   - Videograph all the activities relating to post-mortem examination
   - Record properly the dimensions of each injury, angle of fire, inter-distances of various injuries *inter se*.
   - Identify/connect the exit wound with corresponding entrance wound.
   - Study, describe and record the entrance wound(s) carefully. They carry a lot of useful information.
   - Follow the projectile track(s) in the body from the entrance wound to exit wound in all fatal cases. Assess/record the internal damage carefully.
   - Inter-link the entrance/exit/internal wounds. Delineate them carefully on the skiagram/diagrams indicating correct position, angle, direction, deflections (if any), dimensions, broken bones and tracks of secondary projectile (if any). May use more than one chart, if necessary.
   - Recover the whole projectile charge including wads (if any) and any other foreign material. Indicate/describe the recovery site(s) on a diagram.
   - Write the report in layman's language.

     In a murder trial it was necessary to determine the site of entrance, exit wounds, to reconstruct the sequence of events. The medico-legal report was covered in such technical (or pseudo-technical) jargons that no head or tail could be made out. The local civil surgeon was requested for the rescue. But he also failed to locate the various injuries. The reporting Medico-legal expert was not available. Ultimately the effort to discern the contents of the report was given up. (CH)

The skiagram format used in post-mortem needs change. It should be printed on a millimetre graph paper, printed in very light blue or green ink. It will help to find out:

1. Height at which the injury
2. The exact location of the injury
3. The inter-distances between the injuries
4. The direction and size of the internal track
5. The dimensions of the injuries
6. The area covered by the various injuries—useful to indicate the projectile spread; important to determine the range in shotgun fire
7. Deflection of the projectile, if any

In addition, a textual description of the injuries is recorded in detail.

The importance of human skiagram/sketches for delineating injuries on graph papers cannot be over-emphasized. They help the non-medico-legal professionals to understand the medico-legal reports. The introduction of these graphic sketches is all gain.

The diagrams on graph paper have some indirect advantages also. The officers carrying out the medico-legal examination will be more careful in describing the nature and location of the injuries. Besides the troublesome names of the body parts will not pester the nonprofessional so much.

8.12.5 Evaluation

Evaluations of injuries help the investigation in many ways, including to:

1. Ascertain whether the given wounds are firearm injuries.
2. Indicate the type of firearm used to inflict the wounds.
3. Fix the number of firearm/shots fired to cause the given injuries.
4. Determine the fatal/non-fatal nature of the injuries.
5. Ascertain whether the injuries are ante-mortem or post-mortem.
6. Determine, the range of fire, time of fire, direction of fire.
7. Decide whether the wound(s) are suicidal/accidental/homicidal.
8. Find out if the victim could carry out the alleged activities after receiving the injuries in question or not.
9. Find out the age of the injuries in some cases.

8.12.5.1 Firearm Injury

The projectiles fired by the firearms have certain shapes, velocities and kinetic energies. They have specific characteristics:

- The shape of wounds,
- The pattern of destruction of the tissues,
- Presence of foreign bodies (GSR, bullets, their fragments, pellets, slug,) and burning in a specific pattern (close range phenomenon only)
- The internal track,

These characteristics of the firearm injuries discriminate them from the injuries caused by other weapons.

8.12.5.2 Nature of Firearms

The wounds indicate the nature of firearms used. The nature of injuries from common firearms is given below:

- ***Pistol and Revolver Injuries***

  Pistols and revolvers fire low velocity projectiles, varying from 200-400 m/s. The entrance hole and the track correspond roughly to the diameter of the projectile. The exit wound, when formed have usually greater dimensions.

  Usually, jacketed bullets are used in pistols and both lead and jacketed bullets are used in revolvers. Jacketed bullet, when fired from close range, often form exit wounds. Sometimes, due to bone obstruction the bullet remains in the body. Lead bullets seldom form exit wounds.

- ***Rifle Injuries***

  Rifles projectiles have high muzzle/striking velocities. They cause devastating 'explosive' wounds. The projectiles often fragment or fly away after piercing the body.

- ***Shotgun Injuries***

  The range of fire greatly influences the nature of the shotgun injuries. Contact or near contact wounds look like explosions. Close range shots, up to about three metres, give rat-holes varying in diameter from about 2 to 6 centimetres. From about 2 to 10 metres the projectiles may form a rat-hole surrounded by individual pellet holes. Beyond 10 metres most of the shots form separate holes. The buckshot may separate earlier. For example, LG shots may give individual separate holes from a range of about 2 metres.

  The spread area of the pellets varies with the range and the choke characteristics of the involved gun.

  Ordinarily, the shotguns projectiles do not form exit wounds except when buck shots are fired from close ranges.

- ***Muzzle-loading Firearm Injuries***

  The muzzle-loading shotgun is still used in India. However, their use is diminishing. The user himself loads the gun. He varies the charge from shot to shot. Therefore, there is no specific injury pattern in muzzle- loader firing. The nature of the injury depends upon the quality and the quantity of the powder and the projectile charges, adequate wading, correct packing of the charge and proper initiation. The end result may be as good as in a standard shotgun or as poor or poorer than in a zip gun (improvised firearm).

- ***Improvised (Zip) Guns Injuries***

  Improvised firearms vary from one firearm to another. They give no specific injury patterns. No generalizations are, therefore, possible.

8.12.5.3 Miscellaneous

- **Post-mortem or Ante-mortem Injuries**

  It is necessary, in some cases, to establish that a given firearm injury is ante-mortem to refute the defence allegation that the given firearm injury is post-mortem, introduced by the prosecution to strengthen the evidence against the suspect.

  Ante-mortem injuries bleed profusely while post-mortem injuries bleed little unless some blood vessel is punctured. If the injuries are made on a dead body which is still hot, it may bleed somewhat but not to the extent when the injury is on a live person.

- ***Fatal Injuries***

  A firearm injury is often fatal due to haemorrhage, shock or other complications. However, if a vital part (brain, heart, spinal cord or aorta) is not affected and the injury is attended to immediately and there is no serious loss of blood the person may survive.

- ***Extraordinary Acts***

  A victim sometimes performs certain extraordinary acts before he collapses. The defence in such cases argues that the victim must have died of some cause other than the firearm injury, because the shot should have incapacitated the victim immediately. This argument is not justified. The human body (and mind) sometimes behave in an extraordinary way. It can perform acts, which are considered improbable on medical considerations.

- ***Age of Injuries***

  Determination of the age of the injuries is useful in some cases. It is ascertained from:

  1. The quantity of bloodshed when the injury is still bleeding.
  2. The inflammation or putrefaction of the injury.
  3. The extent of healing. The treatment given has important bearing on the extent of healing.

  Only an experienced medico-legal expert can estimate the approximate age of the injuries.

8.13 RECONSTRUCTIONS

WHY SHOOTING ACCIDENTS?

1. Defective firearms: Safety catch out of order
2. Light trigger pull
3. Negligence: Keeping the firearm loaded/cocked at home
4. Allowing the uninitiated to handle the loaded firearm
5. Letting the children play with the loaded gun
6. Firing the bullet at ricochet prone angles/directions; Ricochet bullets have enough remaining velocities to kill/injure persons
7. Scuffle: trying to snatch a loaded firearm
8. Accidental fall of a loaded firearm on hard ground; hammer taking the impact
9. Kids (under 5) taking a firearm as toy and playing with it, may cause accidents
10. Youngsters, to show off their prowess, handle guns carelessly and cause accident
11. In Northern India, drunken people fire guns to celebrate functions (marriage!), and cause accidental deaths
12. In hunting, hunter often cocks the firearm beforehand, which may get entangled with flora of the jungle and go off, killing/injuring him/other.
13. Cleaning a loaded firearm may cause accident

The reconstruction of the crime, sequence of events/*modus operandi* and verification of versions (prosecution version: defence version: correct version!) in a shooting case is an increasingly important task in Forensic Ballistics. The defence often attempts to discredit the prosecution version and *vice versa.* As the circumstances of each case vary, only general principles and the basic factors, which help to verify the version, are considered here.

8.13.1 Basics

All reconstructions of the shooting incident must:—

1. Be based upon legally valid evidence
2. Be consistent with the involved firearm/ammunition ballistics
3. Be in consonance with the injuries on the victim(s)
4. Be consistent with the scientific/circumstantial/ medical evidence/ witness accounts. Variance, if any, is explicable.
5. Explain/link / account for genuine observed facts.
6. Account for the presence/ role of the seized clues (firearm fired ammunition)
7. Establish irrefutable linkage/de-linkage of the involved clues (firearm with the injuries/damage to the victim, the holes/dents at the scene, the fired ammunition)
8. Be consistent with the IO's findings.
9. Be consistent with the evidence in the documentation (video tape/photographs/ sketches) of the scene.

Reconstruction of events in a shooting case is an important task of a firearm expert. He collects the data, theorises the various models in which the occurrence could take place, checks their compatibility with the data and other evidence, takes into accounts the alternatives/negative evidence. He arrives at the most plausible reconstruction. He thrashes it with colleagues, hones it and finalises the reconstruction in the form of a report with data, illustrations, sketches and other needed graphics.

> ***"It is futile to theorise without proper data."***
> ***Conan Doyle/Sherlock Holmes***

An experienced and conscientious Forensic Expert follows a systematic drill to gather the data for a worthwhile reconstruction relating to a shooting incident:

1. **Visit the crime scene;** the Forensic Expert visits the shooting scene to study its topography and layout of the victim, evidentiary clues and other objects thereon.
2. **Crime scene documentation;** he studies/appraises the IO's documentation [videograph/photographs/ sketches/ textual description/eyewitness(es) accounts].
3. **Photographs;** he examines the photographs of the Crime Scene /victim/injuries, taken soon after the occurrence.
4. **Post-mortem/Medico-legal report;** he digests the contents of the Post-mortem/ Medico-legal report. He may contact the medico-legal expert to clarify doubts/ ambiguities/lacunae and to get additional information if required.
5. **Clothes of the victim;** he evaluates the evidence (projectile holes, propellant residues, marks of struggle, stains, cuts, foreign material). Sometimes even the projectiles or their fragments are found entangled in the clothes.

6. **Firearms;** he examines the firearm to find out whether it is in working order, it is defective, or it is prone to accident. He checks the trigger pull that may be too low. Likewise, barrel check may reveal it to be too loose or choked.
7. **Ammunition;** it is checked for its fire worthiness, its compatibility with the firearm; whether it standard or homemade ammunition; whether it is fired or not; whether the killer bullet is a ricocheted bullet; All have a profound effect on reconstruction.
8. **Basic ballistics facts;** different firearms have different ballistics. Are the wounding phenomena observed in the given crime compatible with the suspected firearm ballistics? Are the injuries from the aiming range?
9. **Demonstration;** once the expert has the data, he reconstructs the shooting event and demonstrates it to his colleagues or to court. Computer graphics, virtual reality and recreation of the occurrence through animation have greatly improved the effectiveness of demonstration the occurrence.
10. **Court's participation;** it is essential. The judge is the final authority to appraise the reconstruction. A seasoned expert involves (enropes) the whole court in the demonstration/ reconstruction.
11. **Expert's performance;** the expert is the prima donna/ the star performer of the reconstruction of the occurrence. He must:
    1) Possess high order of expertise,
    2) Have both qualitative and quantitative experience,
    3) Be a man of science,
    4) Not succumb to conformational syndrome,
    5) Create confidence in the mind of the court of his competency/honesty,
    6) Base the reconstruction on experiments/observations/ precedents and their logical inferences/conclusions.
    7) Present the reconstruction in simple, precise and concise language; supported with data, reasons and illustrations.

Homicide Indicators

1. **Wounds located at non-suicidal sites, are most likely homicidal**
2. **Firing range, beyond powder range is indicative of homicide**
3. **Angle of the shot incompatible with self-infliction/accident**
4. **Multiple shots indicative of homicide**
5. **Presence of gunpowder residue on the suspect's hands/clothes/face indicative of homicide**
6. **Absence of GSR on the hands of the dead indicates homicide**
7. **Shot through clothing indicate murder**
8. **Entanglement of the victim in Zun/Zamin/zar (female/ land/property/ money/wealth) leads to murder**
9. **Revenge lead to murder**
10. **Struggle at the scene indicate murder**

11. Vendetta leads to murder
12. Religious fanaticism is responsible for many murders
13. Class/ faction fights lead to murders
14. Absence of evidence for suicide/accident indicates homicide

8.13.2 The Scene

The scene of occurrence is one of most important sources of reconstruction evidence. For this purpose:

1) He visits the crime scene, even after long the incident.
2) He studies the IO's documentation to get a complete description of the scene with sketches, photographs and video film.
3) He studies the statements of the eyewitnesses.
4) He contacts the IO for more details/clarifications, if need be.

In a case, a girl was killed by a boy in the house of the later. As the two belong to different religions, there was at once a great agitation and danger of communal riots. Preliminary police investigation, however, led to the view that it was probably an accident. Immediate proof, however, was needed. The public had to be convinced one way or the other. The main inexplicable points relating to firearm evidence, apparently incompatible with the"accident" version were:

- *The left side of the face was completely blown off. It did not look like a firearm injury at all. It looked as if the face has been either blown off with an explosive or battered with some heavy irregular instrument.*
- *The body of the girl was found in a room whereas some marks of projectiles were found outside the room on a wall, almost ninety degrees to the alleged line of fire.*

The author was flown to the site. He started investigations:

- *The head of the deceased girl was X-rayed. Most of the charge of a 12-bore cartridge was located inside the head. The public believed that culprit had battered the face of the victim brutally with a blunt weapon.*
- *The pattern of bloodstains, flesh and bone pieces, fired wads was significant. The cushion wad, covered with blood, skin and flesh was found stuck to the wall on the backside of the victim. It was at the same height as of the injuries on the face of the victim. Some pellets had also fallen on the floor after striking the hind wall.*

Some pellets were found outside the room. It was found they were also carrying blood stains. How did they go out, was also clarified. The victim was standing near a window. The pellets after striking the jawbone were deflected and went out through the window. The tell-tale marks produced by blood, bone and skin pieces indicated the path of flight of the potential troublemaker projectiles.

The reconstruction satisfied the public that it was not a case of brutal murder. (CH)

8.13.3 Photographs of the Scene

The photographs of the scene taken soon after the occurrence, are a potent source of information for the reconstruction of a shooting incident.

In an alleged suicide the actual examination of the articles at the scene and the photographs showed following discrepancies in firearm evidence:

The projectile after coming out of the body was resting near the muzzle of the firearm. Later a dent, the bullet had made, was discovered elsewhere.

The firearm (a revolver) allegedly grasped in cadaveric spasm in the hand was found to have a live cartridge at 12 O'clock. There should have been a fired shell, instead, in this position.

The photographs and material exhibit records completely contradicted the suicide theory of death. (CH)

8.13.4 Victim's Clothes

The clothes of the deceased or the injured provide important evidence, which is helpful in the reconstruction of the incident.

In a murder trial, the prosecution story alleged that two persons fired one shot each. One shot was fired from the backside and the other from the right side.

The medico-legal expert found 3 injuries on the deceased. One was on the left side one on the right side and one on the back (post-mortem report). The doctor had not discriminated entrance and exit wounds. It was therefore, decided to examine the clothes. There was only one hole on the back of the shirt. GSR around the hole indicated it was entry hole. It discredited the prosecution version of two shots fired by two culprits. (CH)

8.13.5 Medico-legal Report

The medico-legal report along with the statement of the doctor with cross-examination, re-examination, if available, is studied carefully.

A dead body was found in a jungle. The body was identified. The deceased had gone on the previous day for hunting.

The body was found to have one gunshot injury on the upper right part of the abdomen just above the hip bone. The direction of the injury was steeply upward and inward, towards left. The medico-legal expert had found the entire charge of a 12 bore cartridge under the skin of the left arm pit.

All possible alternatives were considered, and it was found that the injury could be caused only in two positions. In one, the gun could have gone off when the person was standing with his gun resting on the ground on the right-hand side and the muzzle touching the situs of the injury. In second position, the injury could be caused when the person was lying on the ground and a second person had to fire at him, also from a lying position. As the second alternative was illogical, only the first one could have actually happened.

The gun was found prone to accident. The contention of the relatives of the deceased that the victim was murdered was rejected. (CH)

A medico-legal report without diagrams is incomplete. The diagram should be got prepared from the medico-legal expert who had carried out the medico-legal examination.

Alternatively, the help of some other Medico-legal expert who has sufficient experience of the work is obtained to prepare the diagrams.

If the Medico-legal expert had taken radiographs to locate the projectiles and the bone fractures, the radiograph or the copies of the radiographs is also obtained/studied.

8.13.6 Arms and Ammunition

The firearm and the recovered ammunition, live and fired, are invariably examined. After the theoretical reconstruction, experimental reconstruction is carried out using the same arm and similar ammunition. It not only confirms the expert's thesis, it also helps to convince the court.

In an alleged suicide case, the police recovered a .32 revolver from the scene of occurrence. The bullet recovered from the body of the victim was of .38 calibre. It had not been fired from the firearm. (CH)

In another case, a felt cushion wad was recovered from the body. The cartridge case, allegedly recovered from the scene of occurrence, was made in Indian Ordnance Factory, which did not use felt wads in the manufacture of their cartridges. (CH)

Once a 16 bore wad was recovered from the body of the deceased; while a 12 bore gun was suspected to have been used. (CH)

In a murder trial the deceased had suffered a number of injuries. There were three skin-deep abrasions on the left shoulder, one rat-hole on the cheek near the ear and one through and through injury below the left jaw. In addition, there was another injury on the chest about 2 cm in diameter. The Medico-legal expert in cross-examination indicated that these injuries had been caused by four shots. According to eyewitnesses the culprit had fired only four shots. It was, therefore, essential to establish whether the injuries were caused by two or four shots.

The high court referred the case to the author. He carefully studied the pattern and direction of injuries, examined the clothes worn by the deceased and the projectile charge extracted from the body. The study revealed that the injury on the chest was caused by one shot and the other injuries could be caused by one additional shot if the cartridge containing an LG shots was fired when the head of the victim was turned towards the left. The pattern of injuries was duplicated from one to about three metres on an inanimate model. The demonstration of the reconstruction presented to the court. The High Court accepted the presentation. (CH)

The accused appealed against the High Court order. The Supreme Court also accepted the reconstruction with the following remarks:

We have given our most careful consideration to the medical evidence in the light of the above quoted authorities on medical jurisprudence, the deposition of Dr. B.R. Sharma and the contention of Mr. Sibal and our conclusion is that the latter cannot prevail and that the opinion of the ballistic expert, substantially in accord as it is with the said authorities, deserves acceptance.

The conviction/sentence was maintained.[16] *(CH)*

In a case, a person started examining a loaded self-loading pistol. It was an open space. The person pressed the trigger once or twice. The firearm did not go off. In the meanwhile, the owner who was bathing nearby, saw the man handling the pistol. He came running and started snatching the pistol. It went off and killed the owner.

The police suspected murder. However, they sent the firearm to the author. He found it defective. The firearm should go off only when the safety catch is pressed in the grip and the trigger is pulled. In this case, the accused pulled the trigger without pressing the safety. While snatching the pistol, the safety grip was accidentally pressed. The pistol went off, though the trigger was not pressed. Normally it should not have happened if the weapon were not defective.

The plea of the accused, of accidental fire, was accepted (CH)

8.13.7 Basic Ballistics

Basic ballistics of the firearm and ammunition in question should be known.

16. It is a reported case: *Om Parkash v state of Haryana*, AIR 1971 SC 1388.

Suicide Indicators

1. **Choice of the suicide site: closed bedroom/bathroom**
2. **The shooting scene: mainly undisturbed, bullet marks may exist, if it exits**
3. **Presence of firearm in prone position: around hand, near/on the body**
4. **Injury at preferential suicidal sites: temple, mouth, forehead, under chin, chest**
5. **Contact/ near contact/powder range firing; ejecta in/around the wound: contact suicidal shots in over 97.9 % cases; powder range shots in about 2 % Cases;(US Stats)**
6. **Presence of burning, blackening, tattooing, muzzle imprint, dirt/contusion /abrasion rings**
7. **GSR on the hand (that fired the gun), face, clothes**
8. **Suicide note (in about 30 % cases)**
9. **Facing serious social problem: financial/ familial/ business or social problems including sexual harassment, kidnapping, and the like**
10. **Health problem/fatal disease/incapacitation/loneliness/alcoholic/drug addict**
11. **Psychological autopsy: suicide inducing environment: family (violence/strain), office worries, quarrelsome neighbour or suicidal tendencies**

8.14 TIME OF FIRE

It is useful to know when a particular firearm was discharged. However, it is difficult to fix the correct time. The following observations are helpful.

8.14.1 Gunpowder Residue

In black powder ammunition, discharge residues undergo chemical changes with the passage of time. It is possible to form a rough estimate of the time of fire from those changes.

Hydrogen sulphide gas formed is detectable in the barrel for about twenty-four hours, provided the breech end of the firearm is not opened and the muzzle is capped. Sodium sulphide formed changes into sodium sulphite. The change takes place in three to four days. Sodium sulphite, ultimately, changes into sulphate. The change is complete in about seven days.

8.14.2 Carbon Monoxide

If carbon monoxide is detected in the barrel, it is a sure sign of recent fire. The gas can be detected only for a few hours. If the breech end is opened or the barrel is blown through, no gas is left. Long barrelled firearms retain the gas for longer intervals.

8.14.3 Mercury

Mercury fulminate is/was used in cartridge primers. On firing, it releases elementary Mercury is released. It is deposited in the barrel. It evaporates slowly. Its qualitative and quantitative estimation, spectrographically; gives some idea about the time of the fire. The weather conditions and the way the firearm is kept affect the results. In practice, the method is problematic.

Mercury fulminate is used in most of the cartridges made in India.

8.14.4 Bloodstains and Flesh

Bloodstains and flesh may sometimes be found on firearms in contact or near contact wounds. The age of the stains or flesh can indirectly indicate the time of the fire.

8.14.5 Rust

If a barrel is not cleaned and oiled after firing, it starts rusting. The extent of rusting depends upon the nature of the steel, the nature of powder, the cap composition, the weather conditions (temperature and humidity) and the length of time, it has been allowed to rust. The amount of rust may, therefore, permit rough estimation of the time of the fire. The humidity and temperature of the atmosphere and presence of catalysts (like potassium/sodium salts) which are present in powder residues affect the rate of rusting tremendously. They are taken into consideration for correct conclusions.

8.14.6 Dust

The amount of dust deposit gives an idea when the firearm was used last. In a recently fired firearm there should be no dust deposit. The weather conditions and the way the firearm is kept, affect the amount of dust deposited.

8.14.7 Nitrite Variations

The gunshot residues of smokeless powder left in the firing process (in barrels, in cartridge cases and on bullets and pellets) were investigated in the author's laboratory. The residues have been found to contain an unstable compound which gives nitrite test. The amount of available nitrite decreases with the passage of time. It is detected with the usual *diazo* reaction and the variations in its quantity are estimated through the variations of colour intensities of the dye formed. It is possible, with this technique, to estimate the time of fire within certain limitations. It is hoped that the technique proves useful to date the firing of the guns, the cartridges and even the bullets. This may indirectly lead to determine the time of death in cases involving firearms.

8.15 MUZZLE-LOADING FIREARMS

Muzzle-loading firearms are a vanishing species of firearms. But they are still available in rural areas of India and are used in crimes sometimes. The following evaluations are possible when they are used:

8.15.1 Percussion Caps

Percussion caps are normally blown to small pieces. In some cases, however, they may retain identifiable marks. Test percussion caps are fired, without powder and projectile charge. The hammer marks thus obtained, are studied and matched in the usual way.

8.15.2 Projectile Charge

In muzzle-loading guns, homemade projectiles are used usually. The lead of the crime charge is analysed for trace elemental profiles. The profile is compared with similar profile obtained from the lead recovered from the house of the accused. These trace element profiles permit the linkage/non-linkage of the projectiles with the suspected source .

If the buck shots are the crime projectiles, they carry mould marks. They are compared with specimen marks on similar buckshot recovered from the suspect or created from the mould he possess. Comparison of the marks may link/delink the suspect with the shooting.

> *A few years ago, a ball was recovered from the body of the deceased. It was homemade ball. Some balls and the mould were recovered from the house of one of the suspects. The mould marks found on the incriminating ball when compared with the marks on the test moulds prepared from the mould. It established the common source of crime and test balls. (CH)*

Sometimes the ball may carry ram rod marks. Comparison of the marks with the test marks taken on lead or plasticine may identify the common source.

8.15.3 Wads

Rags or pieces of paper are used as wads in muzzle-loading guns. The wads fall at the scene of occurrence. Comparison of the rags or the pieces of paper with those recovered from the house of the suspect may sometimes indicate the common source of origin.

8.15.4 Powder Charge

Gunpowder is used as a propellant in muzzle-loading guns in India. The examination of the gunpowder recovered from the scene and from the suspect may indicate common source.

8.16 IMPROVISED FIREARMS

The improvised firearms are also known as *Country-made Firearms, Homemade Firearms, Pipe-guns, Zip guns*. These firearms are made by an ordinary blacksmith to no particular specifications, nor any standard raw material is used in their manufacture. These weapons have a short span of life and most of them are extremely dangerous.

> ***The simplest improvised firearm, used in a crime case, was an iron tube. A .22 cartridge was fixed at one end. Its base was hammered. The bullet flew from the other end and hit the victim.***

The word "**improvised**" indicates the correct nature of the firearm. They are also called **"country-made firearms"**. Both the names: "country-made" and "'improvised" are being used in this country interchangeably.

The improvised firearms are made from readily available materials, usually by a local blacksmith. The demand for the improvised firearms is so much that many gangs of criminals manufacture improvised firearms on commercial scale[17]. The demand is increasing.

8.16.1 Importance

The firearms are great equalizers of physically the weak and strong persons. They confer a superiority to its possessor over those who do not possess them. They are, therefore, frequently used in the commission of crime, to settle scores with the opponents or to cow down those who do not possess firearms, or to frighten the victim(s) in crime situations. As the legal possession and legal trade is highly restricted, the needy goes in for them.

The Abuse of improvised firearm varies from state to state, from about 25% to over 50%. Therefore, these improvised firearms, are of special interest in criminal investigation and trials.

17. Due to the Indian government's stringent licensing policy and strict control on manufacture/sale of standard firearms, the manufacture and trade in improvised firearms is flourishing.

The improvised firearms provide clinching linking evidence in most of the cases. Formerly, only limited evaluations of the evidence were possible. Now with extensive research, their evidentiary value is .more or less, at par with that of standard firearms.

8.16.2 Classification

Improvised firearms are classified with reference to the ammunition used in them. Thus, we have 12 bore firearms. They fire 12 bore cartridges. Likewise, .303 firearms fire .303 ammunition. As the ammunition of the other types of firearm is not easily available and is very costly, improvised firearms for the other bores or calibres are rare, though sometimes revolvers of .32 and .38 calibres are also met with.

The improvised firearms are also classified according to the manner in which they are fired. Thus, we have the shoulder firearms or the handguns. The improvised handguns (often called *kattas* in India) are used more frequently, probably of their convenient size.

The improvised firearms, by and large, have smooth bore barrels, though some handguns do carry rifling, often in a crude form, more to satisfy the purchaser than to improve the ballistics of the arm and ammunition.

8.16.3 Parts

Improvised firearms have the usual parts:

1. Barrel
2. Chamber
2. Action
3. Lock.

8.16.3.1 Barrel

Improvised firearms have non-standard barrels. They are often pieces of iron or steel pipe used in the sanitary or electrical work or they may be pieces of barrels of discarded barrels of older firearms. They are seldom manufactured by boring of the steel rods. The length of the barrel varies from about 10 centimetres to 25 centimetres in the case of handguns, and it is about 60 centimetres in the shoulder firearms. The following points are noteworthy about the barrels in such guns:

1. The diameter of the bore/calibre seldom corresponds to that of a standard firearm. It varies from 1 cm to 2.5 cm usually. It may even vary from one point to another in the same barrel.
2. The bore surface is seldom smooth. It may have ridges and valleys, protrusions, pits,
3. The thickness of the barrel wall differs from one firearm to another.
4. The barrels often have a welded seam (to form a pipe made from a sheet) which is the weakest structural feature of the barrel.

The barrels of the improvised firearms, which are intended to fire .303 cartridges, have the following noteworthy characteristics:

1. There is usually no rifling in the barrel.
2. The diameter of the barrel varies from 7 to 13 mm. It is not uniform.
3. The barrel is usually thick but varies from firearm to firearm.
4. The bore surface is rough. It carries pits and protrusions, ridges and valleys.

The barrels of the other bores/calibre improvised firearms have similar.

The loose, rough and the non-uniform barrels are responsible for the varying ballistics performance of the ammunition from one shot to another.

Improper materials, the presence of joints, protrusions, pits, in the barrels make these weapons highly dangerous for the user.

Interestingly, the weapon becomes less dangerous to the victim as the ammunition does not acquire the intended velocities. Both the aim and the range suffer drastically. However, they remain highly dangerous at close ranges, at which they are used.

8.16.3.2 Chamber

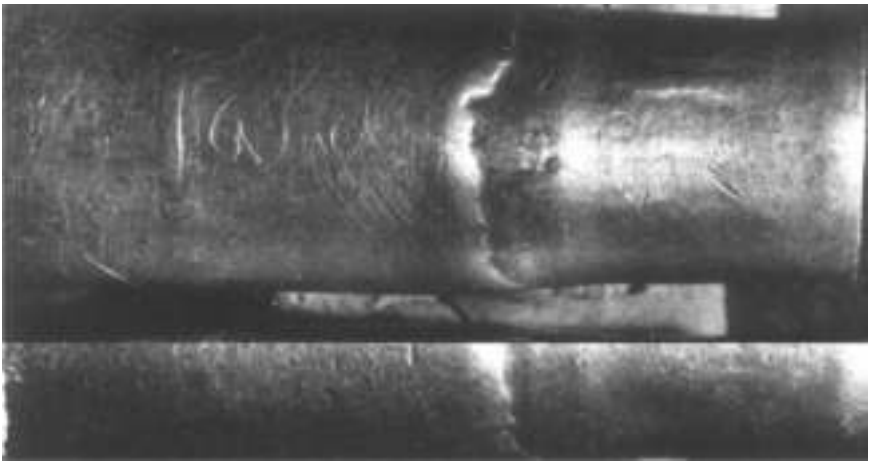

Fig. 8.32

Short chamber of an improvised. 303 pistol, created chamber edge (leed) marks on the fired cartridges, which permitted identifications of the common source

The improvised firearms usually do not have specially made chambers. In most of them the barrel end serves as a chamber. There is no separating structure to mark the end of the chamber.

If the bore diameter is more than the diameter of the base diameter of the cartridge, a special arrangement (some sort of adapter is attached to the chamber end) is made to prevent slippage of the cartridge into the barrel. In very crude firearms, the slippage is prevented by wrapping a piece of cloth or paper around the cartridge tube.

The chambers of improvised firearms, if they exist, do not have the proper dimensions, nor do they have any arrangement for seating the cartridge correctly. Consequently, the cartridge often rests loosely in the chamber, which is an important factor for varying ballistics given by the same firearm from one shot to another.

The loose chambers-fit causes cartridge bursts. A tight chamber imprints the chamber irregularities on the cartridge tube. The imprinted chamber marks facilitate the linage of the firearm and the cartridge case. These assume importance in cases where firing pin or breach face mark are missing. Here percussion cap is blown off and/or backward thrust is not powerful enough to register the breech face marks.

8.16.3.3 Action

The hammer, trigger, and the firing pin (striker) are the important parts of the action mechanism. Often the hammer is cocked manually. It is held in the cocked position through a spring mechanism. When the trigger is pressed, it releases the hammer and the spring makes the hammer strike the firing pin with a considerable force. The firing pin, in turn, strikes the percussion cap to explode (fire) the cartridge.

The main distinguishing characteristics of the action are:

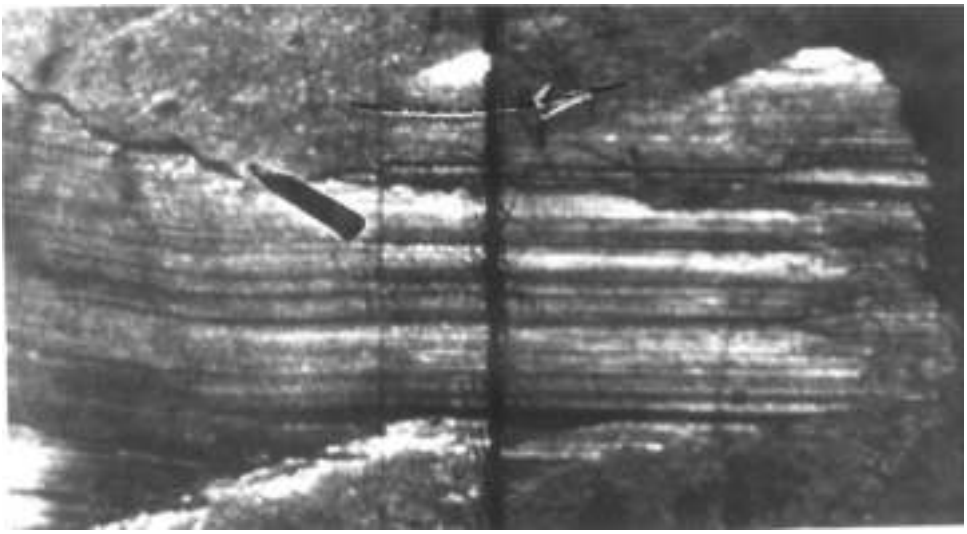

Fig. 8.33

The firing pin of an improvised firearm would not retract. On opening the breech,it scraped the base. Corresponding scrape marks provided the identification

1. The firing pin is more or less a headless nail. In some cases, the head (of the nail) was also observed. It is propelled forward by the striking hammer and kept pushed in, in its new position. Often it is slightly longer than needed and pierces the percussion cap. Thus, gases leak backward. This may reduce the forward propulsive forces somewhat in some cases.
2. The piercing of the cap complicates the identification of the firing pin mark on the cartridge case in respect of the firearm containing the firing pin. However, backward leakage of gases, through the pierced hole, permits more forceful impact of the base of the cartridge with the breech face and ensures better breech face marks on to the base of the cartridge. As the breech face of the improvised firearm is crudely finished, it carries numerous irregularities which leave their marks on the cartridge case. They facilitate identification of the fired cartridge.
3. In most of the cases the firing pin continues to be pressed against the cartridge as there is no spring action to take it back. In such cases, when the cartridge is being taken out, the protruding firing pin may scrape the percussion cap and base of the cartridge to give scrape marks which provide ample evidence to link the fired cartridges with the firearm which fired them.

It is against this background that the identification of a fired cartridge in respect of the involved improvised firearm is often easy.

4. The firing pin in an improvised firearm can be easily replaced. The clever criminals have at times replaced the firing pin or mutilated its original surface characteristics. The fraud does not help much. The breech face marks provide the necessary identification data.

In an interesting case, a criminal, after killing his victim with a gun, went to a blacksmith and got the firing pin replaced. He also obtained a receipt from the blacksmith for the services rendered. Later, the police recovered the firearm from the suspect. It was sealed in the presence of the accused (culprit) and a magistrate and sent to the laboratory.

The author examined the exhibits. He found the difference in the firing pin mark. But there was ample identifying feature in the breech face marks. He linked the cartridge case recovered from the scene with the recovered firearm.

At the trial, the defence counsel produced the receipt. It was dated after the date of murder but before the date of its seizure. The prosecution counsel was upset.

The ballistics expert was called to clarify. The clarification was simple. The firing pin marks differed on the test and crime cartridge cases, but there was still ample evidence, in the form of breech face marks, to link the firearm with the crime cartridge. He demonstrated the difference in firing pin marks and correspondence in the breech face marks through photographs. The court understood the fraudulent replacement of the firing pin.

The fraud of replacement of the firing pin did not succeed/help. (CH)

8.16.3.4 Lock

The locking systems of the improvised firearms are notoriously unreliable. There is no proper barrel-stock coupling system. The locking device is often a nail-hole arrangement. In many the locking is unsafe. Often there is a gap between the breech block and the barrel. The gap promotes cartridge bursts.

8.16.4 Firing Process

The poor construction of firearms affects the firing process in the following ways:

1. A longer and non-retractable firing pin pierces the percussion cap of the cartridge. It adversely affects the initiation of the powder charge, modifying the intended ballistics of the ammunition.
2. The gap between the breech face and base of the cartridge allows the backward movement of the cartridge. Sometimes the cartridge bursts and seriously affects the development of adequate pressure, which in turn affects both the aim and the range. The extent of the effect varies from firearm to firearm and even from one shot to another shot. Metallic pieces may fly when a cartridge bursts, injuring the shooter or bystanders.
3. Over-sized chambers promote lateral expansion which affects the development of a forward pressure. In some cases, the cartridge bursts, which seriously affects the ballistics of the ammunition.
4. An oversized barrel bore allows gases to escape from the sides. It affects the ballistics of the process in the following ways:—
    1. *The gases escaping from the sides do not contribute towards the velocity of the projectiles. The kinetic energy of the projectiles is reduced.*

2. The escaping gases do not build up the pressure. It gives incomplete combustion. It reduces the velocity of the projectiles.
3. The projectiles, due to the above reasons, have lower wounding power.

5. The oversized bore prevents a continuous bullet-bore contact. The random contact may or may not imprint adequate contact marks on the bullet, which hinder bullet-barrel linkage.
6. In undersized bore barrel, the firearm may burst, but it seldom happens. It is There are many reasons. They include incomplete combustion, backward movement of the cartridge, punctured percussion cap, bursting of the cartridge itself.
7. The combustion of the powder charge of the ammunition meant for a long-barrelled firearm is not complete due to short-barrel of the improvised firearm. Consequently, the semi-burnt and unburned powder particles are ejected in considerable amounts along with the projectiles and other ejecta. They travel to longer distances and give a false idea of the range of fire.
8. The incomplete combustion creates a lesser amount of gases and pressure. The projectiles, therefore, do not acquire standard velocities or striking energies. The wounding power of the projectile fired from an improvised firearm is reduced considerably.
9. The improvised firearms do not have rifling. The projectiles fired from them, therefore, do not spin. The aim and range are, consequently, seriously affected, even when the bullets fired are of standard rifle ammunition.
10. As the semi-burnt and unburned powder particles are also hurled along with the other ejecta, the powder range may, thus, increase. The data for powder range of standard firearms do not hold good for the improvised firearms.
11. The rough bore surface may scrape the metal particles from the projectiles. They travel to a greater distance than those in standard firearms and may give false estimates of the range, if the data of the standard firearms is used for the range determination.
12. In an excessively large bore, the bullet may get bent due to striking against the barrel walls at an angle. The bent bullet may mislead the investigator as the bent bullets are also met with in ricochet.
13. In both oversized and undersized bore barrels, the wads may get damaged or marked in a particular fashion. The characteristic change may help the wad-firearm linkage.

8.16.5 Evaluation

The evaluation of evidentiary clues in the improvised firearm follows the usual pattern for corresponding clues in the standard firearms.

8.17 MISCELLANEOUS

8.17.1 Freak Firearms

Freak firearms do not conform to standard firearms. They may look like some innocent object. Freak firearms with the shapes of a fountain pen, walking stick, umbrella, walking stick have been made. The basic requirements of a firearm, *i.e.,* a barrel and a firing mechanism are present in all freak firearms. They fire standard or specially made ammunition.

Fig. 8.34

Cartridges burst on tubular part in defective make-shift firearms.
The burst pattern are similar

8.17.2 Toy Firearms

Toy Firearms look like standard firearms, but they do not fire standard ammunition. They fire blank cartridges or do not fire any cartridge. The firearms are used by children as toys, by actors on stage in theatrical performances, or they are used to frighten animals or human beings with or without firing blank cartridges.

8.17.3 Penetration Power

Penetration power of a firearm and its ammunition is measured from the penetration of the projectile in soft pinewood. Wooden planks of soft pine wood 2.54 centimetres (1.0 inch) thick are stacked parallel to one another at intervals of 2.54 centimetres (1.0 inch). The firearm is fired from a standard close range of 152.4 centimetres. The total thickness penetrated is measured.

Any air rifle or gun firing a projectile, which penetrates 2.54 centimetres (1 inch) of soft pine wood, needs a licence in India. Similarly, a handgun whose projectile, which penetrates 1.27 cm. (0.5 inch), needs a licence.

Penetration powers of air rifles vary. Those, which cross the above limits, need a licence. Others do not.

8.17.4 Range of Firearms

A firearm has a maximum range up to which its projectile can travel and then falls to the ground. It has a fatal range up to which if the projectile hits a vital part, it proves fatal. It has an effective range up to which a shooter can take aim and make a kill. These ranges are

given in the table below. They are only rough estimates. They vary with different firearms and ammunition even of the same type due to certain factors.

Table 8.3

Firearms ranges in Meters

Firearm	Effective	Dangerous	Maximum
Pistols and Revolvers	75	1000	2000
Service Rifles	1000	2000	>3000
Rifled slug/ball	200	1000	1000
Shotgun Buckshot)	75	500	800
Small pellets	75	150	300

8.17.5 Comparative Calibres

It is useful to know comparative calibres of firearms expressed in millimetres, in hundredths of an inch and in thousandths of an inch. The table below gives the equivalent measures

Table 8.4

Equivalent bore diameters

mm.	Hundredth of an inch	Thousand of an inch
5.6	.22	.220
6.35	.25	.250
6.5	.25	.250
7.0	.26	.260
7.5	.28	.280
7.62	.30	.300
7.63	.32	.320
7.65		
7.9	.32, .315	.320
8.0		
9.0	.35	.380
	.38	
10.35	.40	.445
10.75	.41	

mm.	Hundredth of an inch	Thousand of an inch
11.00	.44	.445
11.2	.45	.455
11.25 .45 .455		

8.17.6 Bore Diameters

Shotguns are designated by bore such as 12 bore, 16 bore and so on. They do not convey the diameter measurements. It is useful to know the bore number and their diameters.

Table 8.5

Bore diameters of various smooth bore shotguns

Bore or gauge	Diameter in inches	Diameter in centimetres
4	.935	2.67
6	.919	2.334
8	.835	2.121
10	.775	1.968
12	.729	1.852
14	.693	1.760
16	.662	1.682
18	.637	1.618
20	.615	1.562
24	.579	1.47

8.17.7 Conversion Barrels

In some firearms the same stock and action are used with ammunition and barrels of different calibres. Such a firearm can mislead the investigation. A criminal may use a 9 mm. barrel and ammunition for the commission of a crime. Later he fits a 7.63 mm. barrel with the firearm. The investigating officer would feel that the 7.63 mm. firearm would not fire 9 mm. ammunition. He, therefore, searches for some other firearm. He should be vigilant about such possibilities.

The fired cartridges, even though of different calibres, will bear similar marks from the firearm. The projectiles will bear different marks depending upon the barrel used.

8.18 PRESENTATION OF EVIDENCE[18]

A firearm expert who has the rank of an Assistant Director, Deputy Director or a Director of a Forensic Science Laboratory is not required to give evidence in person. Their reports are considered sufficient as evidence. Others have to appear in person to prove their reports.

18. Please see chapter 3 for detailed discussion. Also see chapter 22 of Author's Book ***Firearms in Criminal Investigation and Trials***. V Edn 2017. LexisNexis.

The expert giving the evidence, establishes himself as an expert, identifies the exhibits, he has examined in the laboratory, produces test exhibits prepared at the time of examination, gives experimental details, produces the data generated and presents the conclusions from the observations made by him. He illustrates his conclusions by photographs, illustrations, if necessary.

8.18.1 The Expert

An expert appearing in the court states his qualifications, training and experience, both in firearm examination and related fields. He describes his research work, paper published, and those read in seminars, conferences and meetings. The qualifications and experience are, thus, brought on record for the convenience of the court to decide whether the person giving evidence is an expert under section 45 of the Indian Evidence Act or not. Section 45 of the Indian Evidence Act requires that only those persons can give expert evidence who are especially skilled in the art or science, in which they are expressing their opinions. The data on the expert's qualifications/experience/research, of on record is to show that he is specially qualified to express the given opinion by all standard.

If the court, prosecution and the defence do not question the *bona fide* of the expert, his evidence is accepted as expert evidence.

I AM FORENSIC BALLISTICS EXPERT

1. **Academically, I am M Sc (Hons)/Ph. D in Chemistry.**
2. **I had training in New Scotland/other Home Office Laboratories, in Forensics in UK for 4 months.**
3. **I have handled thousands of Forensic Ballistics cases, over the past few decades and gave evidence in courts.**
4. **I have written/published about a hundred papers in Forensics including some on Forensic Ballistics.**
5. **I have written/published over half a dozen books on Forensics, including one on Forensic Ballistics (Fifth Ed.).**
6. **I have been teaching Forensics to one and all: Forensic science students/ medico-legal experts/judges/lawyers/ investigators and others.**
7. **I have participated in examinations/reconstructions of shooting scene/cases.**
8. **I have participated in forensics conferences/ meetings/ seminars/workshops.**

8.18.2 Exhibits

The expert gives opinion relating to exhibits already examined by him in his laboratory. He puts identification marks on the exhibits at the time of the examination. The identification marks are ordinarily the case number (of the police station or of the laboratory), his initials and date. If there are more than one exhibits of the same type, they are given different serial numbers. It is sometimes not possible to put identification marks on some exhibits as they are too small. In such cases, the expert checks the seals and contents of the packets, which carry the identification marks and testifies that it is the same packet in which the exhibits were returned.

The original packing cover in which the expert had received the exhibits is preserved and produced in the court. It is customary to send the cover along with the exhibits without destroying the seals thereon whenever possible

In a murder case, the prosecution produced a rifle in the court. When checked by the expert, the rifle did bear his initial but other identification marks did not tally. The police store (malkhana) official was contacted Correct rifle was brought. The rifle originally sent belonged to another case. (CH)

The cartridge cases are marked as C/l to C/n, the bullets as B/1 to B/n and firearms as FA/1 to FA/n. Other articles are marked A/1 to A/n.

8.18.3 Experimental Data

The expert gives briefly the details of the experiments and his observations. If he has prepared test exhibits, charts and photographs he produces them in the court. The expert also marks the test exhibits for future identification.

Court on Data

"It is difficult to see how reliance can be placed on the opinion unless it is supported by good reasons founded on the facts that warranted that opinion. If the reasons are good and convincing, and the factual data on the basis of which the opinion is formed, warrant the opinion, the court will rely on the opinion."

***Suleman Usman Memon v Gujarat,* 1961**

8.18.4 Illustrations

The firearm evidence is technical in nature. The observations are made through microscopes. Correct idea about these experiments cannot be given by verbal/textual description alone. These observations, are, therefore, illustrated through photographs for the convenience of the court and the counsels.

The findings of the expert are based upon multipronged examinations, tests and observations.

8.18.4.1 Cartridge Cases

A cartridge case may carry indentations or scrape marks. The indentation marks are illustrated with side by side photographs of crime and test cartridges, often taken through a comparison microscope on the same negative in juxtaposition. The photographs are pasted on a chart. The prominent indentations are marked thereon by drawing lines and giving corresponding numbers. Written notes, on the chart, explain them.

All types of indentations (firing pin, breech face, chamber, extractor and ejector) are illustrated in the same way.

Composite and superimposed photographs are produced sometimes, but they do not offer any superiority over the side-by-side photographs. In fact, the former is sometimes confusing to the nonprofessional. He cannot appreciate the small dimensional differences and some omissions/additions due to difference in the pressures developed in different cartridges fired from the same firearm.

The latter are illustrated like striation marks on bullets through composite photographs.

The use of photographic illustrations in the court is decreasing. A judge cannot distinguish whether a photograph is taken from a crime or a test projectile. The judge has to depend upon the expert. If the expert is dishonest, instead of comparing crime and test exhibits *inter se*, he

may use test exhibit in place of crime exhibit also and show matching data. The courts have realized this lacuna and now they do not insist upon photographic illustrations in firearm cases.

The expert should be brief and methodical. However, the brevity is not achieved at the cost of clarity.

8.18.4.2 Bullets

Bullet identifications are illustrated through a composite match taken through a comparison microscope. The prominent lines that show continuations across the dividing line from crime to test exhibits are sometimes numbered on the dividing line. The matched striations are usually from one groove or land. But if the number of lines is inadequate, more than one lands and/or grooves are matched and photographed.

The bullets are seldom illustrated through side-by-side photographs.

It is not possible to give the minimum points of similarities for a definite identification. In bullet identification, however, the continuation of about ten lines across the dividing line should be considered sufficient, provided, there is no characteristic divergence, which cannot be accounted for. The class characteristics (the diameter of the bullets, the number, direction and the dimensions of lands and grooves) must tally.

Fine lines in land or groove marks are more important than thick and deep scratches from the identification point of view.

A perfect duplication of marks is impossible even when the ammunition of the same make and batch is fired from the same firearm one after the other. Usually 70% line match indicates common source of origin and 25% or more non-matching line casts doubt on the common source.

8.18.4.3 Range

The patterns of scorching, blackening, tattooing, deposition of metal particles or of dispersion of pellets (in a shotgun) are illustrated through test patterns obtained on filter paper targets. Photographs of the pattern with scale are also prepared for permanent record.

8.18.5 Medical Evidence

A medico-legal expert gives his findings and opinion about firearm injuries in a proforma prescribed for post-mortem report. The report contains:

1. A complete description of the injuries with their positions, dimensions directions and skiagram of the injuries.
2. A sketch showing the positions/ sizes of the injuries and the internal track of the projectile(s)
3. Photographs of the injuries with scale, before and after cleaning
4. The nature, quantity and position of the foreign matter (GSR, projectiles and wads), recovered from the victim
5. Radiograph of projectiles in the body.
6. Existence/ absence of contributory cause(s) of death; for example, the person may be suffering from some disease.

An Old Adage

"A picture is better than a thousand words"

8.18.6 Language of the Experts

The expert is expected to bring the technical evidence to the level of a nonprofessional. He, therefore, uses simple, non-verbose, intelligible language. He avoids technical terms or complex theories in both the report and oral statement before the court. If he has to use technical terms, he explains them.

8.18.7 Cross-Examination

Cross-examination of an expert should aim at proving a point. Questions are framed carefully and the sequenced logically. Haphazard cross-examination may in fact damage the defence case.

The counsel has ordinarily the following aims in cross-examination.

Cross-examiner's Mantra

Be mild with the mild; shrewd with the crafty, confiding with the honest, merciful to the young, the frail and the fearful, rough to the ruffian and a thunderbolt to the liar. But never compromise your dignity.Focus fully so that virtue and truth triumphs.

Paul Brown: Harris, 1911

8.18.7.1 To Discredit the Expert Witness

Incompetency of an expert is established through questions relating to his qualifications, training, experience, research publications, membership of societies and participation in seminars, conferences and meetings on the subject.

It is futile to try to discredit a qualified, experienced and well-established expert. But it is criminal to accept an imposter as an expert.

A few years ago, one of the High Courts, rejected the expert evidence because:

1. *the "expert" had examined only one case in twelve years.*
2. *he did not carry out satisfactory tests,*
3. *he produced test exhibits so as to enable the court to come to its own conclusion. (CH)*

If the expert has a bad reputation, the evidence is discredited by quoting excerpts from previous judgments, where the evidence of the expert had not been believed and his honesty has been questioned. However, legally the evidence of even such an expert is evaluated properly for its value.

8.18.7.2 To Clarify Evidence

"Eye-witness accounts, medical reports and other physical evidence sometimes conflict with the firearm evidence. Clarification and elucidations in such cases prove extremely useful. The defence counsel may point out apparent discrepancies in different types of evidence.

8.18.7.3 To Prove Inadequacy

The evidence produced by an expert may be incomplete or insufficient. If the defence counsel detects these defects and brings them on record, the expert evidence is ignored. For example:

1. if test exhibits are not produced, the evidence is rejected,
2. if the expert is unable to identify the exhibits as the same as were examined in the laboratory, the evidence becomes suspect and rejected
3. if the report is bereft of data the court does not accept the *ipse dixit* of the expert.

8.18.7.4 Eliciting Additional Evidence

Sometimes the additional evidence relating to arms and ammunition may turn tables:

1. The variation in the manufacturers of the wad and the fired cartridge case brought an acquittal to an accused person.
2. The non-presence of the projectiles in the body and there being no exit wound proved fake nature of the injuries.

8.18.8 The Court's Role

An expert is to assist the court. He should give evidence without bias.

The court is to form its own opinion. It is, therefore, essential that the court gets clarification from the expert on all points which are important on which the expert can assist. The prosecution and the defence counsels are interested on only those aspects which help their case. Court is the main person to assess the truth. By intelligent questioning, it may not allow an expert to give complete facts.

It is the duty of the court to clarify the ambiguities through court questions.

> *In an interesting trial, the judge asked most of the questions (574 out of 825) from one doctor witness.*[19] *In the appeal, the appellant submitted that it was improper for the judge to take over the functions of the prosecution and defence counsels. The appellate court, however, rejected the contention and remarked that the judge is empowered to ask any number of questions, in any form relevant or irrelevant,* vide *section 165 of the Indian Evidence Act. (CH)*

A judge presides at a criminal trial not only to see that no innocent person is punished but also to see that no guilty person escapes punishment.

19. *Sunil Chandra Roy v State of West Bengal,* AIR I954 Cal 305.

ANNEXURE I

EVIDENCE INFORMATION CHART

Laboratory requirements

(1) Unmutilated, uncontaminated and undamaged evidentiary clues in their original form. (2) Adequate samples: Firearm, live ammunition, scene of occurrence (visits, photographs, sketches, description), clothes, medico-legal report.

Evidence	*Location*	*Collection & packing*	*Identification marks*	*Required samples*	*Possibilities*
1	2	3	4	5	6
Scene of occurrence	Ascertain from disturbance, marks and clues.	1. Photograph 2. Sketch. 3. Describe.	1. The photo data and the date on which the work was done. 2. All documents must be signed and witnessed (when possible).	Visit to the scene by an expert may be useful.	1. Determination of the real or fake scene. 2. Reconstruction to verify the version: suicide, murder, accident or self-defence.
Firearms: pistols, revolvers, rifles,shot-guns, muzzle-loaders, toy guns,air guns, improvised guns, automatic, semi-automatic firearms	1. Scene: floor, clothes, furniture. 2. Accused: person, residence, hide-out. 3. Victim. 4. Route.	1. Unload. Remove the detachable evidence. Process the fingerprints. 2. Encase in plastic envelope/sheet. 3. Seal in the cloth/ cloth-lined envelopes.	1. Initial with date, case number on the non-changeable and on all the inter-changeable parts. 2. Note the make and the serial number of the firearm. 3. Record the descrip-tion with a sketch.	——	Linkage with the fired ammunition period of fire, range, fire worthiness, accident prone, reconstructions, ownership through the serial numbers and the fingerprints.
Fired ammunition:bullets, cartridge cases, pellets, wads,fragments of project-iles, powder particles.	1. Scene: floor, fur-niture, walls, trees may be embedded. 2. Firearms: cases, stuck up bullets. 3. Victim: bullets and pellets inside, powder marks.	1. Collect all. 2. Encase in the plastic envelopes. 3. Seal in the cloth-lined envelopes. 4. Accused: on the person, at residence or at the testing place. 5. Previous owner.	1. Mark the shells in-side, bullet at baseor on ogival area, pellets on unmarked place. 2. Describe the exhibits.	1. Corresponding live and fired ammunition from the suspect. 2. Firearms.	1. Linkage with the firearm or the fired ammunition. 2. Number of shots. 3. Number of firearms. 4. Nature of the firearms. 5. Period of the fire.

Evidence	*Location*	*Collection & packing*	*Identification marks*	*Required samples*	*Possibilities*
1	2	3	4	5	6
Live ammunition: powder, cartridges, projectiles.	Scene, house or the hideouts of the accused.	1. Collect all. 2. Encase in plastic envelopes.	1. Write on cylindrical or tapering portion, avoiding damage any available evidence.	——	1. To establish whether prohibited or non-prohibited.
		3. Seal all in the non-to rattling containers.	2. Describe the ammu-nition (quantity, condition, make,)		2. Nature of the firearms. 3. Test ammunition.
Marks: projectile holes, powder marks, metallic deposits.	1. Victim: clothes, 2. Scene: floor, walls. Furniture. 3. Suspect: hands and clothes.	1. Photograph and collect marks bearing articles or their parts. 2. Seal.	1. Mark the clothes, cover. 2. Describe	Live ammunition and the firearms.	1. Cause. 2. Range. 3. Reconstructions. 4. Identification of the injuries, ammunition. 5. Angle of fire.
Traces: fingerprints, hair, fibres, blood, flesh and dust.	Attached with the fire-arm, cartridge cases, live ammunition, projectiles. (Also with the victim, the sus-pect and the scene).	1. Collect all. 2. Encase in the plastic envelopes. 3. Seal	1. Mark the envelope. 2. Describe the evidence.	Corresponding sam-pleas from the victim,accused, or from the scene.	Linkage of the firearm with the scene, the victim or the accused, reconstruction, range.

1	2	3	4	5	6
Firearm injuries:entrance, exit and internal wounds.	1. Person of the victim. 2. Apparel worn by the victim. 3. Objects hit at the scene. 4. Bystanders. 5. The culprit.	1. Photograph beforeand after cleaning. 2. Draw the graphic diagrams. 3. Differentiate the ent rance and the exit-wounds. 4. Collect the washing. Pack the washing in a spill-proof container. 5. Take the radiographs. 6. Describe fully (post-mortem or injury reports reports).	1. Initials with date and the case num-ber by the relevant persons. 2. Keep a copy of the report.	1. Arms, ammunition. 2. Clothes of the victim. 3. Photographs and the description of scene. 4. The doctor's statement 5. The victim's or the defence version.	1. Firearm injury. 2. Range. 3. One or more firearms. 4. Verification of the hypothesis: suicide, accident, murder, self defence.

Court requirements:

(1) Location of the evidence is established through photographs, sketches and description.

(2) Recovery of the evidence is proved authentic through witnesses.

(3) Relevancy, identity, integrity and intact chain of possession is proved from the time of recovery to the time of production in the court through the identification marks on the exhibits and through the transport of the exhibits in the sealed packets.

(4) The record of the discovery, recovery, possession and the description of the evidence is complete.

8.20 SUPREME COURT: (21ST CENTURY CASES)

8.20.1 Entrance or Exit Wound[20]

Author's Summary

It is a case of murder by gunshot fire. There were 2 injuries. It was difficult to decide which was entry wound. The court on the basis of the size, inversion of margins and possibility of blast effect fixed the entry wound. Quoted authorities also.

Highlights italicised.

Relevant Extract (Verbatim)

Now we advert to the argument that the nature of injuries disclosed that the shot was fired while the injured was running and hit him from the back. It is mainly based on the medical evidence of first examining Dr. R.K. Mishra (P.W. 23) and the death summary Ex. P/38. In these, gluteal wound is mentioned as the entry wound. The Doctor has not given any reason for this opinion, but, the observation appears, *prima facie*, contradictory to the medical opinion expressed by eminent Doctors or experts in their textbooks of Medical jurisprudence.

The gluteal wound was larger in size, *i.e.*, 1" x 1" and had everted margin. The wound at the root of scrotum was smaller in size *i.e.*, ¾ " x ½" and had inverted margins. The area of injury to the muscle surrounding the scrotum for 3 ½", is of no importance as the skin and muscle in that area are in, more or less, loosely hanging state in a man. So the real size of the wound would be the spot where the stiff muscle starts. The size of which was ¾ "x ½" with inverted margin. A wound of entry is smaller in size than the wound of emergence. The wound of entry has inverted margins and wound of emergence has everted margins.

In *Modi's Medical Jurisprudence and Toxicology,* 21st Edn., at p 264 this opinion is mentioned:

> *The wound of entrance in distance shot is usually smaller than the projectile due to the elasticity of the skin, and round when the projectile strikes the body at a right angle and oval when it strikes the body obliquely. The edges of wound are inverted … The wound of entrance and its edges are irregular and everted … The edges of both the wounds of entrance and exit may be everted in fatty persons due to protrusion of fat in the wounds, and in decomposed bodies from the expansive action of the gases of putrefaction … ".*

In a book on the subject namely: "*Forensic Science in Criminal Investigation and Trials*" by Dr. B.R. Sharma, Ph.D., Director, Himachal State Forensic Science Laboratory, Shimla, at p 275, it is observed regarding wounds caused by firearm that

> *when velocity of a fired shot exceeds 600 metres per second and up to 1100 meter per second, it also causes wound of the nature of blast effect.*

Thus, the wound in the loose skin around the testicles of the deceased could be because of such effect also. At the same page it is also mentioned that if a projectile comes out of

20. *Vijay Singh v State of Madhya Pradesh,* 2000 Cr LJ 650.

the body the exit wound is larger than the entrance wound. So the laceration in that area after testicles of the size 3½ x 3" with irregular margin is explainable on this theory of blast effect of a fired shot. Even in Gaur's book namely *Fire Arms, Forensic, Ballastic, Forensic Chemistry and Criminal Jurisprudence* (2nd Edn., 1989) it is observed at p 82 that wound of exit is usually larger than the wound of entrance, unless on the way through the body the projectile is intercepted by some bones and, there is some deformity or disintegration in the projectile. Shri K. Kumar in his book "*Forensic Ballistics in Criminal Justice*" based on his experience as Directors of Ballistics Laboratory of various states, making a scientific exposition of gunshot wounds, compares wound of entrance and wound of exit as under:
Wound of Entrance

1. **Size:** Appears smaller than the wound of exit due to inversion. Greater the distance, smaller the appearance. Contact shots are an exception to this phenomena due to stretching of surface skin.
2. **Shape:** Regular, *i.e.* circular when the bullet hits at right angles and oval when it hits and penetrates in an angular direction.
3. **Nature:** Punctured and lacerated.
4. **Margins:** Usually inverted, but in case of a wound on fatty part of the body, the entrance wound may appear as everted due to protusion of fat. May be surrounded with abraded collar and contused. A quantity of grease may be deposited. There may be blackening, scorching, tattooing, singeing, of hair in case of close range shot. Microscopical examination of skin and subcutaneous tissues around the wound of entrance will disclose evidence of carbonisation, swelling and homogenisation of dermal collagen apart from the deposit of dark particles.

These opinions in the eminent books on Medical jurisprudence cannot be ignored because of the opinion of the Doctor in this case, given without reason and without the support of authority. Even if the Doctor was produced by the prosecution itself, the court is bound to see whether there is real conflict between the medical evidence and other evidence from the fact observed by the doctor. Thus, after having observed the size of the wounds and inverted and everted nature of the margins, the Doctor was required to give the opinion why he considers the gluteal wound as of entry. He has not done so. The opinion is contrary to the opinion of renowned experts. Similarly on what basis the death summary relates the gluteal wound as entry wound is not known.

8.20.2 Ballistic Evidence not Indispensable[21]

Author's Summary

It is a case of murder by gunshot fire. IO did not send the firearms to the Ballistics expert because he found them defective. The defence argued that the creditworthiness of the case is totally demolished entitling the respondents the benefit of acquittal. The SC did not accept the argument because there was ample other evidence to support the case. Firearm evidence could be dispensed with.

Highlight italicised

21. *State of Punjab v Jugraj Singh*, AIR 2002 SC 1083 : 2002 AIR SCW 823 : 2002 Cr LJ 1503 (SC).

Relevant Extract (Verbatim)

To justify the opinion of the High Court, learned counsel for the respondents-accused argued that as the doctor had not made a mention of gunshot injuries in the post-mortem report, his later deposition before the police regarding the nature of the injuries should not be accepted. We cannot accept such a plea either legally or factually. There is no obligation on the doctor to describe the origin or cause of the injuries in the post-mortem report as he stated in his deposition in the Court. Otherwise also we find that a mention of firearm injury is factually made in one of the columns of the post-mortem report. It is further contended that as the doctor had stated that "due to putrefaction the normal anatomy of tissues is disturbed, so collar of abrasion showing two zones of inner grease and outer of abrasions was not possible for me to distinguish", the medical report could not be relied upon. In support of his contention, the learned counsel has referred to Modi's *Medical Jurisprudence and Toxicology,* 22nd Edn., where it is stated that putrefaction follows the disappearance of the *rigor mortis*, and that as the *rigor mortis* was present, putrefaction could not have been noticed by the doctor. We have perused the opinion of the learned Author and find that in the same heading "Putrefaction of Decomposition and Autolysis" it is stated that "putrefaction follows the disappearance of the *rigor mortis*, but this is not always the case; since, in Northern India, especially during the hot months from April to October, it commences before *rigor mortis* has completely passed off from the lower extremities." It is not disputed that the occurrence had taken place in Northern India during the period, referred to by the learned Author.

Pointing out to another defect of not sending the weapon of offence, the guns, to the Ballistic Expert for examination for his expert opinion, it is argued that the creditworthiness of the case is totally demolished entitling the respondents the benefit of acquittal. In support of his contention, the learned counsel relied upon a judgment of this court in *Sukhwant Singh v State of Punjab*, 1995 (3) SCC 367 wherein it is held that:

> *There is yet another infirmity in this case. We find that whereas an empty had been recovered by P.W. 6, ASI Raghubir Singh from the spot and a pistol along with some cartridges were seized from the possession of the appellant at the time of his arrest, yet the prosecution, for reasons best known to it, did not send the recovered empty and seized pistol to the Ballistic Expert for examination and expert opinion. A comparison could have provided link evidence between the crime and the accused. This again is an omission on the part of the prosecution for which no explanation has been furnished either in the trial court or before us. It hardly needs to be emphasised that in cases where injuries are caused by fire-arms, the opinion of the Ballistic Expert is of considerable importance where both the firearm and the crime cartridge are recovered during the investigation to connect an accused with the crime. Failure to produce the expert opinion before the trial court in such cases affects the creditworthiness of the prosecution case to a great extent.*

In that case the evidence of the two eye-witnesses was held inadmissible as they were not examined in terms of section 138 of the Evidence Act and the court did not rely upon the sole testimony of Gurmej Singh (P.W. 3). In that context the court observed that failure to produce the expert opinion affected the creditworthiness of the prosecution case to a great extent. Nowhere it was held that on account of failure to produce the expert opinion the prosecution version in all cases should be disbelieved.

In the instant case the Investigating Officer has categorically stated that guns seized were not in a working condition and he, in his discretion, found that no purpose would be served for sending the same to the Ballistic Expert for his opinion. No further question was put to the Investigating Officer in cross-examination to find out whether despite the guns being defective the fire print was in order or not. In the presence of convincing evidence of two eye-witnesses and other attending circumstances we do not find that the non-examination of the expert in this case has, in any away, affected the creditworthiness of the version put forth by the eye-witnesses.

8.20.3 Differentiation of Marks on 2 CCs (No Gun Work)[22]

Author's Summary

It is a case of murder in which a bar tender was shot dead. The alleged culprit (finally convicted) allegedly fired one shot. The police recovered 2 fired shells from the scene. Firearm(s) was not recovered. The experts failed to interlink/delink the 2 shells. Defence urged that the second shot, fired by another unknown person, might have killed the victim.

The court was misled to believe that firearms are needed to link/delink the fired shells *inter se*.

Normally two fired cartridges can be identified whether they had been fired from the same or different firearms as the marks left by a particular firearm are unique and individual to that firearm. The firearms are not needed to ascertain the factum. The modern NIBIN (Automatic Comparison Systems) does not require firearm(s) for the identification at all. Previously fired cartridge data is used for comparison/evaluation. There is ample support for the proposition in literature: *See*: Sharma, BR. *Firearms in Criminal Investigation and Trials,* V Ed., (2017) Pages 252, 263. Only in rare cases differentiation is not possible when the marks of the firearm are not printed properly, or they are mutilated.

Highlights italicised

Relevant Extracts (Verbatim)

(1) These statutory appeals are filed under section 2(a) of the Supreme Court (Enlargement of Criminal Appellate Jurisdiction) Act, 1970 and under section 379 of the Criminal Procedure Code against the final judgment and order dated 18/20 December 2006 passed by the High Court of Delhi in Criminal Appeal No. 193 of 2006 whereby the High Court reversed the order of acquittal dated 21 February 2006 passed by the Additional Sessions Judge, Delhi, in Sessions Case No. 105 of 2001 and convicted Sidhartha Vashisht @ Manu Sharma (appellant in Crl. A. No. 179 of 2007) under sections 302, 201/120B IPC and section 27 of the Arms Act and sentenced him to undergo imprisonment for life for the offence under section 302 IPC together with a fine of Rs 50,000 to be paid to the family of the victim and in default of payment of fine, to undergo further imprisonment for three years and also sentenced him to undergo imprisonment for four years for the offence under section 27 of the Arms Act with a fine of Rs 2000 and in default to further undergo imprisonment for three months. He was further sentenced to undergo imprisonment for four years for the offence under sections 201/120B IPC together with a fine of Rs 2,000 and, in default, to further undergo imprisonment for three months. The High Court also sentenced Amardeep Singh Gill @ Tony Gill (appellant in Crl. A. No. 157/2007) and Vikas Yadav (appellant in Crl. A. No. 224/2007) to undergo rigorous imprisonment for four years and a fine of Rs 2000 each and, in default of payment of fine, to further undergo imprisonment for three months under sections 201/120B IPC.

(2) The case of the prosecution:

(a) On the night intervening 29/30 April 1999, a 'Thursday Party' was going on at Qutub Colonnade at "Once upon a time" restaurant also called "Tamarind Cafe". The liquor was being served by the bar-tenders, namely, Jessica Lal (since deceased) and one Shyan Munshi (PW-2). At about 2.00 am, Sidhartha Vashisht @ Manu Sharma (appellant in Crl. A. No. 179 of 2007) along with his friends came there

22. *Manu Sharma v State (NCT of Delhi),* AIR 2010 SC 2352 : (2010) 6 SCC 1.

and asked for two drinks. The waiter did not serve him liquor as the party was over. Jessica Lal and Malini Ramani (PW-6), who were also present there, tried to make him understand that the party was over and there was no liquor available with them. On refusal to serve liquor, the appellant took out a pistol and fired one shot at the roof and another at Jessica Lal which hit near her left eye as a result of which she fell down. Beena Ramani (PW-20), who was present there, stopped the appellant and questioned him as to why he had shot Jessica Lal and demanded the weapon from him but he did not hand over the pistol and fled away. Jessica Lal was rushed to Ashlok Hospital from where she was shifted to Apollo Hospital. On 30 April 1999, in the early morning hours, Jessica Lal was declared brought dead at Apollo Hospital.

(b) On the night intervening 29/30 April 1999 at 2.20 am, DD Entry No. 41A (Ex. PW-13/A) was recorded at Police Station Mehrauli which disclosed a shooting incident at H-five-sixth Qutub Colonnade. A copy of the said DD entry was handed over to SI Sharad Kumar (PW-78) who along with Ct. Meenu Mathew left for the spot. Near about the same time, copy of the said DD entry was also given to SI Sunil Kumar (PW-100) who along with Ct. Subhash also left for the spot. On reaching the spot, PW-78 found that the injured had been removed to Ashlok Hospital and the floor of the Restaurant was found to be wet. SI Sunil Kumar (PW-100) then left SI Sharad Kumar (PW-78) at the spot to guard the same and proceeded to Ashlok Hospital along with Ct. Subhash. The SHO, Police Station Mehrauli, Inspector S.K. Sharma (PW-101) along with his team also left the Police Station *vide* DD Entry No. 43A and reached the spot and deputed one Home Guard Shravan Kumar (PW 30) at the entrance of 'Qutub Colonnade' to guard the vehicles. On reaching Ashlok Hospital, PW-100 met Beena Ramani (PW-20), who is the owner of the Restaurant, and enquired about the incident but she asked him to talk to Shyan Munshi (PW-2) saying that he was inside and he knew everything. PW-100 then recorded the statement of PW-2 and made an endorsement on the same for the registration of the case under section 307 IPC and handed over it to Ct. Subhash to be carried to the police station, Mehrauli. At about 4.00 am, FIR No. 287/99 was registered at the police station, Mehrauli. In the meantime, Jessica Lal had been shifted to Apollo Hospital. When SI Sunil Kumar came back to the spot along with PW-2, PW 30 informed them about the lifting of one black Tata Safari from the spot. On inspection of the site, two empty cartridges were seized and, in the meantime, a supplementary statement of PW-2 was also recorded by PW-100. At about 5.45 am, PW-100 received an information by Ct. Satyavan intimating him about the death of Jessica Lal at Apollo Hospital. Charge under section 302 IPC/201/120B IPC and under section 27 of the Arms Act has been framed against the accused Sidhartha Vashisht @ Manu Sharma, charge under sections 201/120B IPC has been framed against accused Vikas Yadav, Amardeep Singh Gill @ Tony Gill and Alok Khanna, charge under section 212 IPC has been framed against Harvinder Chopra, Raja Chopra, Vikas Gill @ Ruby Gill and Yograj Singh and charge under sections 201/212 IPC against Shyam Sunder Sharma. At about 7.00 am. PW 100 recorded the statement of the Manager (PW-47), Waiter (PW-46) and Beena Ramani (PW-20)-the owner of the Restaurant.

(c) The post-mortem was conducted at about 11.30 am at the All India Institute of Medical Sciences on the same day *i.e.* 30 April 1999. In the meantime, at about 11.00 am, SI Pankaj Malik (PW-85) had been sent to Chandigarh to secure the black Tata Safari and to arrest the appellant. PW-100 corded the statements of the witnesses. On 30 April 1999 at about 4.15 pm, an FIR was registered against Malini

Ramani (PW-6), Beena Ramani (PW-20) and George Mailhot (PW-24) under sections 61/68/1/14 of the Punjab Excise Act. At about 8.30 pm, PW-100 handed over the investigation to SHO S.K. Sharma (PW-101). On the night intervening 30 April 1999/1 May 1999, at about 2 am, the police raided the farm house of the appellant and on search being conducted seized a photograph of the appellant. On 2 May 1999, a list of invited guests was prepared by PW-24. On the same day, around 10.00 pm, PW-101, got an information that a black Tata Safari has been found by the U.P. Police (Sector 24, Noida Police Station) and on the next day PW-101 went to Noida Police Station and seized the said black Tata Safari. On 5 May 1999 at about 2.30 am, Amardeep Singh Gill @ Tony Gill and Alok Khanna were arrested and from their alleged disclosure statements, the involvement of Sidhartha Vashisht @ Manu Sharma was confirmed. On the same day, Inspector Raman Lamba (PW 87) who was in Chandigarh with his team intimated the lawyer of the accused-appellant that Manu Sharma is required in the case. On receipt of the information, on 6 May 1999, the appellant surrendered before PW-87 and was later arrested at about 2.20 pm and brought to Delhi. On 7 May 1999, the police produced the appellant before the Metropolitan Magistrate and sought police remand for effecting recovery of the alleged weapon of offence. An application for conducting Test Identification Parade (TIP) of the appellant was also moved. Thereafter, the appellant was remanded to five days police custody till 12 May 1999 and thereafter on 12 May 1999 extended till 17 May 1999 on the application of the I.O., but on 15 May 1999, the appellant's remand was preponed from 17 May 1999 to 15 May 1999. On 16 May 1999, the appellant was sent to judicial custody. On 30 May 1999, the accused-Vikas Yadav was also arrested. After the completion of investigation, the other accused persons were also arrested.

(d) On 3 August 1999, charge-sheet was filed against ten accused persons. On 23 November 2000, the Additional Sessions Judge framed charges against the appellant/Manu Sharma under sections 302, 201 read with section 120B IPC and section 27 of the Arms Act, accused Amardeep Singh Gill was charged under section 120 read with section 201 IPC, accused Vikas Yadav was charged under section 120 read with section 201 IPC as also section 201 read with 34 IPC, accused Harvinder Chopra, Vikas Gill, Yograj Singh and Raja Chopra under section 212 IPC and accused Alok Khanna, Shyam Sunder Sharma and Amit Jhingan were discharged of all the offences. In 2000/2001, Revision Petition No. 596 of 2000 was preferred by the prosecution before the High Court of Delhi praying for the framing of charge against the accused persons and setting aside the discharge of Alok Khanna, Shyam Sunder Sharma and Amit Jhingan. Revision Petitions were also preferred by the accused persons against the framing of the charges against them. The High Court disposed of all the revision petitions filed by the accused persons by a common order dated 13 March 2001. On 12 April 2001, charges as per the orders of the High Court were framed and some of the charges as framed earlier were maintained. Charges under sections 120B/201 IPC were framed against accused Vikas Yadav, Amardeep Singh Gill @ Tony Gill and Alok Khanna and charges under sections 201 and 212 IPC were framed against accused Shyam Sunder Sharma. Against the rest of the accused, the charges as framed on 23 November 2000 by the trial court were maintained. The trial began in May, 2001 against nine accused. In all, 101 witnesses were examined by the prosecution and two court witnesses were also examined.

(e) … On 28 January 2002, the appellant was released on interim bail for a period of six weeks by the order of the High Court dated 25 January 2002 with a direction to surrender after the expiry of the same. In compliance with the conditions

of interim bail, the appellant surrendered on 11 March 2002 but again sought for and granted interim bail for a period of ten weeks starting from 20 March 2002. During the period from March 2002 to February 2006, the appellant was enlarged on bail on different occasions by various orders of the High Court. On one occasion, against the dismissal of the bail application by the High Court on 11 November 2003, the appellant filed a special leave petition before this Court which was dismissed by this Court on 2 December 2003. On 21 February 2006, after trial, the Additional Sessions Judge acquitted all the nine accused including the appellant-Manu Sharma.

(f) Challenging the acquittal, the prosecution filed an appeal before the High Court, being Crl. Appeal No. 193 of 2006. On 20 December 2006, the High Court *vide* the impugned order, convicted and sentenced the appellants, as mentioned in paragraphs above. Challenging the said order of the High Court, all the three appellants filed above mentioned separate appeals before this Court. All the appeals were heard together and are being disposed of by this common judgment.

(64) The evidence in respect of two FSL reports is as under:

By letter dated 6 July 1999, the seized material was forwarded to CFSL for examination and expert opinion and, *inter alia*, the following queries were made to be opined by the CFSL:

5. Please examine and opine whether the two empties present in parcel mentioned at SI. No. 5 have been fired from the same weapon?

6. Please examine and opine whether the bullet lead in parcel No. 6 and the bullet empties in parcel No. 5 have been fired from a standard firearm or a country made firearm?

7. Please examine and opine whether ejector, trigger, chamber, magazine or other chamber marks are present on the live bullet empties contained in parcel Nos. 6 & 5 respectively

8. If the answer to query No. 7 is yes them whether these marks are similar and caused by the same firearm?

The Ballistics Division of CFSL gave report in respect of the queries as under:

(1) The .22 badly mutilated lead bullet (marked BC/1) of No. 3 could have been fired from a standard .22 caliber firearm.

(2) The two .22 cartridge cases marked C/l and C/2 have been fired from two different .22 caliber standard firearms.

(3) The .22 cartridge (marked C/3) of parcel No. 5 is a live cartridge and no characteristic tool marks (*i.e.* firing pin, ejector, extractor, breech face, magazine or chamber marks) could be observed on this cartridge.

(4) The two .22 cartridge cases (marked C/l & C/2) of parcel No. 4 and the .22 cartridge (marked C/3) of parcel No. 5 have similar Head Stamp of 'C' indicating that they are of the same make. No opinion on their series (lot/batch) could however be given.

According to the State the same also contained inconclusive opinion. It was pointed out that the State has neither relied on the report of the expert Sh. Rup Singh nor had filed it in the trial Court. An application was moved by the accused for the supply of the document and *vide* order dated 14 January 2000, the Metropolitan Magistrate directed that the State will have to supply all the deficient copies and also the remaining CFSL reports sent by CFSL to SHO. The opinion of Sh. Rup Singh, Ballistic expert finally exhibited as Ex. PW 89/DB only says that "it appears that the two cartridge cases are from two different pistols." As rightly pointed out such a vague opinion of the expert can neither be relied upon nor can be any basis to come to a conclusion that there were two persons who had fired two different shots.

(65) With regard to Prem Sagar Manocha PW-95, Ballistic expert at FSL, Jaipur, a specific query being query No. 3 that whether both the empty cartridge cases have been fired from the same firearm or otherwise. In the reply to the said query, the expert opined that no definite opinion could be given on the two .22 bore cartridge cases C-l and C-2 in order to link with the firearm unless the suspected firearm is available to examination.

It was pointed out that the trial court puts a question to the witness and while putting the question first gives a specific fact finding that for reply to Query No. 3, the presence of the firearm was not necessary. This incorrect finding of fact given by the trial court based on no expertise and had resulted in grave miscarriage of justice.

It is well-settled that while giving reports after Ballistic examination, the bullets, cartridge case and the cartridges recovered and weapon of offence recovered are carefully examined and test firing is done at the FSL by the said weapon of offence and then only a specific opinion is given.

(66) It is contended by the learned counsel for the appellant/Manu Sharma that the prosecution tried their level best to suppress the report of the Ballistic expert Shri Rup Singh which was not favourable to them and that the same was exhibited at the instance of the defence as Ex. PW 89/DB. It has been further argued that while the charge-sheet was filed on 3 August 1999, the police sought an expert opinion practically at the end of the investigation *i.e. vide* letter dated 16 July 1999, Ex. PW-89/DA. At Sl. No. 67 of the charge sheet one finds mention of the letters sent by the SHO seeking the expert opinion. The charge sheet was filed without expert opinion. The accused on seeing Sl. No. 67, approached the committal Court and asked for the expert report. It has been argued that the I.O. had received the opinion in the first week of December, 1999 but did not file the same. On 21 December 1999, the Court directed the prosecution to file the report. The SPP objected to the same on the ground that the order required modification but the same was rejected and on 14 January 2000, the Court again directed supply of the expert report. It has been argued that since the report did not favour the prosecution, the same was withheld. It has been further argued by the defence that failure on the part of the prosecution to bring on record material which is in favour of the accused is a breach of Article 21 of the Constitution. It has been argued by the defence that it was improper on the part of the prosecution to condemn a ballistic expert, *i.e.,* Rup Singh without calling him in for cross-examination. It has been further argued by the defence that by virtue of section 293 Cr PC, the report is admissible in evidence and that the weapon is not required to show whether the two empties are fired from the same gun and the weapon is only required when one has to determine as to whether a particular weapon was responsible for firing the empties in question. The expert evidence is only good if it appeals to the judicial lines; appreciation of such evidence can only be the work of the Court. Reliance has been placed on *A.E.G. Carapiet v A.Y. Derderian*, AIR 1961 Cal 359 paras 10-14 to assert that every witness must be cross-examined before being discredited. The prosecution cannot challenge the expert at the stage of appeal when his testimony went unchallenged at the stage of the trial.

(67) It has been argued that the Court must lay down in clear terms the duties of a public prosecutor *i.e.*, to tell the truth even if the same is in favour of the accused. Reliance has been placed on rule 16 of the Bar Council of India Rules which are to the said effect. Reliance is further placed on Attorney-Generals Guidelines contained in Archbold Criminal pleadings edition 2003 to say that it is obligatory on the part of the prosecution to disclose all the material. It has been argued that even after an application under section 391 Cr PC has been filed, the prosecution still chose not to call the expert Rup Singh and cross-examine him. Ex. PW-89/DB supports PW-2 and *vice versa*, since his evidence is corroborated by the expert report. Attention of the Court was invited to the results of the examination. As regards the 2nd opinion given by PW-95, it has been argued that this court must assume that the prosecution sought a favourable

opinion from the said witness. The said witness obliged them and created confusion by saying that no conclusive opinion can be given without examining the weapon in question.

(67) It was pointed out by the State that the said report of Rup Singh is inadmissible in law since it is a photocopy and, therefore, does not fall within the purview of a report in terms of section 293 of the Code. In other words, in terms of the relevant provisions of the Indian Evidence Act unless the original document is placed for the scrutiny of the Court, no reliance can be placed on the photocopy without leading proper secondary evidence in this regard. In any case, both section 293 and section 294 of the Code which dispense with formal proof of documents under certain circumstances make it abundantly clear that the documents sought to be relied upon must be the originals.

1. Assuming for the sake of the argument, though not admitting, that the said report of Rup Singh, *i.e.,* Ex. PW-89/DB is admissible even though a photocopy has been placed on record and even though nowhere it has come in evidence that the same *i.e.,* the photocopy has been compared and scrutinized with the original by the Court and then placed on record, the same still loses all credence in the light of the fact that a perusal of the forwarding letter and report would show that there seems to have been some tampering with the said documents since the sequence of numbering of the parcels as between the forwarding letter and the report has been changed by somebody which fact remains unexplained as, therefore, casts a further doubt on the genuineness of the said report. The report itself with regard to the query No. 3 shows that "it appears that the two cartridge cases C-l and C-2 have been fired by two different weapons". This opinion of the expert was vague and on the basis of said opinion no credence can be lent to the fact adverted to by the defence that there were two persons who fired two different shots from two different weapons.

   Moreover the said report is oddly silent on query No. 7 of the forwarding letter wherein it was specifically asked about the various markings on the live cartridge and the bullet empties. The stand of the defence that to opine the two cartridge cases are from the same weapon or not, the pistol is not required and the pistol is only required when the opinion is sought whether they are from that particular weapon or not, cannot be accepted. It is well-settled that when pressure is built inside the cartridge case, which results in the pushing out of the bullet from the barrel, there is difference in the marks to the extent that it may be either clear or unclear and flattened or deepened thus no opinion can be rendered on account of this dissimilarity in the absence of the weapon of offence and test firing.

Further once the report of Rup Singh is rendered inadmissible the two-gun theory of the defence becomes wholly inadmissible and what remains is that the two empties found at the spot are .22 bore cartridges, that the live bullet found in the Tata Safari is a .22 cartridge and that the gun belonging to the appellant is a .22 bore pistol which was used for the commission of the crime of murder of Jessica Lal.

(68) The prosecution obtained another opinion from FSL Rajasthan and the queries made are as under:

"1. Please examine and opine the bore of the two empty cartridges present in the sealed parcel.

2. Please opine whether these two empty cartridges have been fired from a pistol or a revolver.

3. Whether both the empty cartridges have been fired from the same firearm or otherwise."

In response to these queries, the expert opinion of the FSL, Rajasthan is as under:

1. The caliber of two cartridge cases (C/l and C/2) is .24.
2. These two cartridge cases (C/1 and C/2) appear to have been fired from a pistol.
3. No definite opinion could be given on two .22 cartridge cases (C/1 and C/2) in order to link with firearm unless the suspected firearm is available for examination.

It was pointed out by the State that this opinion also was inconclusive in nature. In the worksheet, it was categorically recorded that the Investigating Officer be informed to make available the suspected firearm used for definite opinion on linking of C-1 and C-2 with the same firearm or otherwise. The worksheet also records that the firearm involved be sent for definite opinion. At this juncture, it is relevant to note that the trial court posed a leading question as under:

> **Q**. From reply to query No. 3 the presence of the firearm was not necessary. The question was whether the two empty cartridges have been fired from one instrument or from different instruments?
>
> **Ans.** The question is now clear to me. I can answer the query here and now these two cartridge cases were examined physically and under sterio and comparison microscope to study and observe and compare the evidence and the characteristics marks present on them which have been printed during firing. After comparison, I am of the opinion that these two cartridge cases C/1 and C/2 appeared to have been fired from two different firearms.

The said witness in further cross-examination replied as under:

> There is nothing in the record of the Court on my report on the basis of which I had given this finding that C/1 and C/2 were fired from two different firearms

The said witness in further cross-examination deposes that no photographs were taken or there is any other evidence to show the basis of opinion given by the witness before the trial court.

(69) The learned senior counsel for the appellant-accused has contended that the contention of the prosecution that the trial court could not have asked the particular Court question to PW-95 is contrary to section 165 Cr PC inasmuch as the power of Judge is very wide. It has been further argued by the defence that the duties of a Presiding Officer are set out in section 165 of the Indian Evidence Act. Reliance is sought to be placed on *Ram Chander v State of Haryana*, AIR 1981 SC 1036 : 1981 Cr LJ 609 : (1981) 3 SCC 191. It has been argued that the judge knew that the issue was whether two empties were fired from the same gun. It has been further argued that the judge has seen Ex. PW-89/DB and, therefore, any judge would have noticed that the controversy was whether these two bullets were fired from the same weapon or not. The judge also found out that this query went to the CFSL and CFSL answered the same. It has been argued that, therefore, the Judge knew that to answer this query weapon was not required. It has been argued that the Court must read in between the lines.

(70) It is pointed out by the State that the contention of the prosecution was that the trial court could not have first put a specific finding of its own opinion to the expert witness and then to ask him questions. Learned Solicitor-General pointed out that in the attempt of the trial court to extract the truth from the said witness, it misdirected itself in law by posing such a question. This is impermissible even as per the judgment in *Ram Chander* (supra) relied on by the defence. This judgment is in fact in favour of the prosecution since the same clearly puts an embargo on the power of a judge to ask questions so as to frighten, coerce, confuse or intimidate the witness. The danger inherent in a judge adopting a much too stern an attitude towards witness has been duly explained in the said decision. The judge cannot ask questions which may confuse a witness. The argument that the judge knew that the issue in question

was whether the two empties found on the spot were fired from the same gun is wrong and misleading. The judge knew that as per the charge framed against Manu Sharma it was he alone who was charged with the possession and use of a gun. The judge also knew that the first expert opinion was brought on record at the instance of the accused; the judge further knew that PW-95 had stated in no uncertain terms that no opinion can be given as regards the two empties without receipt of the weapon of offence.

In spite of knowing all this, the judge first put a finding of its own to the witness that he did not need the firearm in question in order to reply as to whether the two empties were fired from the same gun* i.e., *a gun and not the gun. The Court exceeded its power under section 165 of the Evidence Act by putting the question after giving its own finding.

(71) On behalf of the prosecution, it is pointed out that the entire argument of the accused that an expert opinion was sought at the fag end of the charge sheet to seek a favourable opinion in favour of the prosecution in fact suggests that the I.O. in question was oblivious of the fact that such an opinion could work to the detriment of the case of the prosecution *i.e.,* two empties having been fired from the same weapon of offence belonging to accused Manu Sharma. The fact that the I.O. sought to mention at S. No. 67 of the list of documents in the charge-sheet about the forwarding letter to the expert only suggests that the prosecution had no intention of carrying out the act of seeking an expert opinion, is hiding.

The discretion on the part of the I.O. and the superior officers was rightly exercised when they decided not to file the expert report since they realized that the expert report is ambiguous as it uses the term "appear" when it suggests that the two empties appear to have been fired from different weapons. Clearly the said opinion was far from conclusive and would have only created confusion in the case of the prosecution.

Thereafter a second opinion was sought wherein the expert *i.e.*, PW-95 opined that a conclusive opinion can only be given after the receipt of the weapon of offence. The argument that the weapon of offence is not required to determine whether the two bullets have been fired from the same gun is based on the wrong premise that the two empties would necessarily consist of features which would enable an expert in determining the said fact. For instance, as in the case of a handwriting expert who has to give an opinion about two different sets of near identical questioned documents and as to whether the same belong to different persons, if the argument of the accused has to be accepted then the expert should be able to give such an opinion without having in his possession the specimen handwriting and the admitted handwriting of the accused. It is stated that such an approach would render the opinion as that of a layman and not an expert. Similar would be the case of a finger print expert who undertakes the process of discovering two different sets of finger print which are in question, without having the specimen or the admitted finger print of the accused in question. In other words,

> ***an expert is only an expert if he follows the well accepted guidelines to arrive at a conclusion and supports the same with logical reasoning which is a requirement of law as laid down in the Indian Evidence Act. In the present case, the moment Rup Singh uses the word "appear" his opinion unsupported by reasons becomes inconclusive and stands discredited for the purpose of placing reliance on. The opinion of Rup Singh was at query No. 7 as to "please examine and opine whether ejector, trigger, chamber, magazine or other tool marks are present on the live bullet and the bullet empties contained in parcel Nos. 6 & 5 respectively."***
>
> ***Though Shri Rup Singh has given opinion qua query No. 5 that the two .22 cartridge cases appear to have been fired from two different .22 caliber standard firearms but his opinion is completely silent on the marks i.e. ejector, trigger, chamber, magazine or other tool marks on the bullet empties (Ex. PW 89/DB). Clearly an option was available to the accused under section 293 Cr PC to call for the witness and ascertain from his for sure that the two empties were in fact fire from two different weapons,***

however, the accused did not choose to do so in terms of section 293 Cr PC In any case, the opinion of Rup Singh as of today is of little use to the accused for the reasons stated above and since it is both inconclusive and unsupported by any reasoning whatsoever and, therefore, cannot appeal to the judicial mind of this Court. Similar is the case with the expert opinion of PW-95 which is again inconclusive. There is no evidence on record to suggest that PW-95 gave an opinion to oblige the prosecution. On the contrary, his response to the Court question reveals that he was extremely confused as to the issue which had to be addressed by him in the capacity of an expert. In the concluding part of his testimony he reaffirms the opinion given by him which is that without test firing the empties from the weapon of offence no conclusive opinion can be given.

72. It is pertinent to note that the testimony of the experts i.e., Rup Singh exhibited as Ex. PW-89/DB and PW-95 Prem Sagar Minocha exhibited as Ex. PW-95/C-1 in inconclusive. The expert PW-95 Prem Sagar Minocha has stated in his report that it is only on receiving the weapon of offence that a conclusive opinion as to whether the two empties (cartridge cases) found at the spot were fired from the same weapon or from two different weapons could be given.

73. The defence seeks to reply upon the testimony of PW-2 with regard to the two-gun theory put forward. In this regard, the defence seeks to corroborate the said part of PW-2's testimony with the testimony of the two ballistic experts. It has also been contended by the defence that the testimony of a hostile witness must be corroborated by the other reliable evidence on record in order to be admissible. The law is very clear that where a witness for the prosecution turns hostile, the Court may rely upon so much of the testimony, which supports the case of the prosecution and is corroborated by other evidence. PW-2's testimony as regards the identity of the person shooting, is certainly not corroborated by the testimony of the experts since both the experts have given opinions which cannot qualify as the conclusive opinion of experts.

8.20.4 One or Two Guns from Injuries on Two Persons[23]

Author's Summary

It is a case of gunshot fire(s) which killed one and injured another. There were 3 types of evidence. The eyewitnesses saw one gunshot fire. Medico-legal expert found that the deceased was killed by a bullet injury and the injured had pellet injuries. The ballistics expert opined that 2 firearms have been used. The trial court acquitted the accused because of contradictory evidence. High Court reversed the order.

The Sc on re-appreciation of the evidence agreed with the trial court and issued guidelines to the appellate courts when to reverse trial court decisions.

Highlights italicised

Relevant Extracts (Verbatim)

7. On 14 March 1979, the deceased, Shiv Charan PW-1, Brij Raj Singh PW-2, Yad Ram PW-4, Nathi Lal (not examined) and Bishambhar (not examined) had taken the customary Gur (Jaggery) during the Holi festival.

8. On their way home, they happened to pass by the home of the accused. The accused was standing just outside his home and was holding a shot gun. The accused began to verbally abuse the deceased. Thereafter, the accused fired one single shot from his gun,

23. *Ghurey Lal v State of Uttar Pradesh,* AIR 2009 SC (Supp) 1318 : 2008 AIR SCW 6598 : (2008) 10 SCC 450.

killing the deceased with a bullet and causing injuries to Brij Raj Singh PW-2 with pellets. Hearing the gun shot, some people quickly assembled at the scene. The accused fled to his room, which he locked from inside. The uncle of the deceased, Shiv Charan, lodged the FIR that very evening, the 14 March 1979 at 6.15 pm, at the Barhan Police Station in the District of Agra.

9. The accused provided his own version of the event. According to the statement of the accused under section 313 of the Code of Criminal Procedure, he went to the place of Kanchan Singh where Gur (Jaggery) was being distributed. One Bal Mukand told the accused to leave the Gur distribution ceremony, as the deceased, Brij Raj Singh PW-2, Yad Ram PW-4, Nathi Lal and Bishambhar had collected pharsa, lathis and kattas declaring that they will deal with him (accused) when he comes there. On hearing this, the accused returned to his home and grabbed his gun. The deceased and others then arrived at his home, brandishing weapons. The deceased carried a *pharsa*, Nathi Lal had a *katta*, Brij Raj Singh a knife and Yad Ram and Bishambhar possessed lathis. To threaten and check them, the accused aimed his gun at them. This was to no avail. The deceased and others struck at the accused, hitting his gun. Nathi Lal fired his katta, causing pellet injuries to Brij Raj Singh PW-2. A scuffle ensued in which the deceased's group tried to snatch away his gun. In the scuffle, the gun was accidentally fired, killing the deceased. The accused sustained pharsa and lathi blows on the butt and barrel of the gun. Fearing for his life, the accused went to his room and locked the door from inside.

10. Brij Raj Singh PW-2 was sent to the Government Hospital, Barhan for medical examination. Dr. Govind Prasad PW-3 found the following injuries on the person of Brij Raj Singh, PW-2:

1. Round lacerated wound 0.3 cm x 0.3 cm on right side back 10 cms away from mid line 9 cms below the border of scapula. Margins burnt and inverted, and tattooing present in an area of 5 cms. No pellets palpable. Bleeding present.
2. Lacerated wound of exit 1.5 cm x 0.5 cm on right side back 0.8 cm away and lateral from injury No. 1. Skin burnt and tattooing present in the area of 5 cm x 5 cms. Merging of the wound inverted. No pellets palpable.

11. The Doctor opined that the injuries were caused by a firearm. He advised that x-rays be taken and that the injuries be kept in observation. In his opinion, the injuries were caused by a gunshot and were of fresh duration. In his opinion, the injuries could have been caused around 4 pm. The doctor sent the memo Ex. Ka-4 on the same day, informing the case of Medico-legal nature to the Barhan Police Station.

12. The autopsy on the deceased was conducted by Dr. Ram Kumar Gupta, PW-5, Medico-legal expert, SNM Hospital, Firozabad, District Agra. It revealed the following ante-mortem injuries on the deceased:

1. Gunshot wound of entry 2.5 cm x 2.5 cm x through and through on right side neck 2 cm lateral to midline of neck front aspect.
2. Gunshot wound of exit 5 cm x 4 cm x through and through on right side back of neck 5 cm below right ear corresponding to injury No. 1 with margins everted.

The Doctor opined that the cause of death was due to shock and haemorrhage as a result of ante-mortem injury.

15. *The crucial question which arose for consideration was whether the injuries caused to Brij Raj Singh PW-2 could have been caused by the same shot that killed the deceased. If that was possible, the prosecution version became probable. But if the shot that killed the deceased and the shot that caused injuries to Brij Raj Singh were from different weapons, then the defence version was more probable. Shri B. Rai, Ballistic Expert, Forensic Science Laboratory, U.P.*

was called as court witness No. 1. He was asked to explain the nature of the 12 bore cartridges and give an opinion, for which he wanted time to carry out experiments in the laboratory. The gun was given to him and he performed a test in his laboratory in the light of the statements of the eye-witnesses, medical report and site-plan. He submitted his report, Ex. C-Ka. l, wherein he clearly opined that injuries Nos. 1 and 2 of the deceased were possible by the gun Ex. 3 of the accused and injuries Nos. l and 2 of the injured Brij Raj Singh were possible by another fire. By "fire", it is clear from the record that the Ballistic Expert was referring to a "firearm".

16. Ultimately, we must answer the following question: Whether the prosecution story of a single shot causing injury to two persons, that is bullet injury to deceased and pellet injury to Brij Raj Singh, with the accused as the aggressor, stands sufficiently proved beyond reasonable doubt?

17. In order to decide whether a single shot was fired or in fact two different shots were fired, we must carefully examine the versions of the prosecution and the defence and the report of the Ballistic Expert. According to the trial court, the medical evidence coupled with the Ballistic Expert report revealed the existence of two fires from two weapons and as such was inconsistent with the prosecution story. The trial court further provided that it is difficult to separate falsehood from the truth, as some material aspects of the occurrence appeared to have been deliberately withheld. "One has to separate the chaff from the grain and it is difficult to lay hand upon what part of the prosecution evidence is true and what part is untrue". According to the accused, the trial court had taken a reasonable and possible view of the entire evidence on record.

20. The post-mortem report Ex. Ka-5, photo lash Ex. Ka-7 and the statement of Dr. Ram Kumar Gupta PW-5 indicate that the wound of entry was on the right side of the neck 2 cm. lateral middle line on front aspect. The exit wound was on the right side back of neck 5 cm. below the right ear. This means that the bullet had entered from the front side of the neck from *(at?)* a distance of 2 cm. lateral to middle line, and it had come out from the back of the neck at a place 5 cm. below the right ear. In this way, the trial court reasoned that the barrel of the gun, when discharging, was slanting vertical. The mouth of the barrel was upward and its butt downward. The barrel and the butt were not horizontal to the ground at that time.

The trial court observed that injury No. 1 (wound of entry) on Brij Raj Singh PW-2 was on the right side of his back 10 cm. away from the mid line, 9 cms. below the lower border of scapula. Injury No. 2 (wound of exit) was on the right side of his back 8 cm. away and lateral from injury No. 1. This means that the exit wound was by the side of the entry wound at a distance of 8 cm.

21. The dictionary meaning of 'lateral' is "by the side" and this means that the two injuries caused by pellets to Brij Raj Singh PW-2 were horizontal and not vertical. The trial court opined that the single shot could not have caused vertical injury to one person and horizontal injury to another. It found it doubtful and not sufficiently proved that the same shot could have injured Brij Raj Singh and killed the deceased.

22. This conclusion is further fortified by the report of the Ballistic Expert Sri B. Rai Court witness No. 1. He has given a definite opinion after making actual experiments by firing shots. This was done from the distance at which the occurrence was said to have taken place. The eye-witnesses had testified to this distance. The Ballistic Expert opined that the injuries to Brij Raj Singh PW-2 were from a different shot from the one that killed the deceased.

The relevant part of the evidence of the Ballistic Expert reads as under:

> **Question**-Whether bullet and *Chharras* both be used in 12 bore gun or not?
>
> **Ans.**-12 bore gun have no bullet. It has small *chharas*, big *Chharras* or one single ball shot with diameter about 0.645".

23. The Ballistic Expert after studying the post-mortem report observed as under:

> *"Studying the post-mortem report No. 51/79 of deceased Ghurey Lal and injury report of Brijraj Singh dated 14 March 1979, statement of doctor and witnesses and site plan and keeping the result of above experiments in mind, I reached in conclusion that injury No. 1 and 2 possible to sustain to deceased Ghurey Lal by this gun from the distance of 10 feet and injury No. 1 and 2 of injured Brij Raj Singh seems to sustain by some other shot."*

24. The Ballistic Expert categorically stated that in cartridges of standard 12 bore shot guns, bullets from other rifles cannot be used with small and big *Chharras* (pellets). Therefore, the trial court concluded that both the injuries were not possible by a single firearm.

25. Leading experts of forensic science, particularly ballistic experts, do not indicate that from a single cartridge both bullets and pellets can be fired. Professor Apurba Nandy in his book "Principles of Forensic Medicine", first published in 1995 and reprinted in 2001, discussed cartridges. Professor Nandy mentioned that in some cases, instead of multiple pellets, a single shot or metallic ball, usually made of lead, is used. We note that the discussion regarding cartridges exclusively mentions pellets. No mention of bullets and pellets in cartridges is found in the numerous volumes of scholarly literature that we have consulted. Relevant discussion reads as under: p 241

The Cartridges (the ammunitions)—

The cartridge of a shotgun and the cartridge of a rifled weapon are essentially different in their Makes. The cartridge of a shotgun—(Fig. 10.69) The cartridge of a shotgun has the following parts and contents—

1. The cartridge case.—The longer anterior part of the cartridge case is made of cardboard. The posterior part and the posterior surface is made of brass. The margin of the breach end of the cartridge case is rimmed, so that, the cartridge can be properly placed inside the chamber and with pressure on the rim the empty cartridge case can be easily ejected out of the chamber. The anterior margin of the cartridge case is twisted inward to keep the pellets and other materials inside the case compact. The anterior part of the cartridge case is made of cardboard, for which, with the production of gas inside the cartridge case it can slightly expand so that, the twisted grip by the anterior margin will be released and the pellets can come out of the case. The posterior metallic part keeps the shape of the breach end of the cartridge intact. It helps to maintain the right position of the cartridge in the chamber, so that, the percussion pin of the hammer strikes the percussion cap rightly at the breach surface of the cartridge. At the central part at the breach end inside the cartridge case is the percussion cap.
2. The percussion cap.—It contains primer or priming mixture and there are some vents or openings on the wall of the percussion cap. When the posterior surface of the percussion cap is struck by the percussion pin, the priming mixture which consists of a mixture either of mercury fulminate, pot, chlorate and antimony sulphide or of antimony sulphide with lead styphnate, lead peroxide, barium nitrate or tetracene, gets ignited due to the pressure and friction and fire comes out through the vents or openings on the wall of the percussion cap.
3. Contents inside the cartridge case.

Surrounding the percussion cap is the gun powder or the propellant charge which cannot ignite by pressure or friction and which on being ignited does not produce flame but produces huge amount of gas. Usually the gunpowder of the shotguns contains charcoal, pot, nitrate and sulphur. This combination of the gunpowder is known as black powder, as it produces much smoke. Now-a-days semi-smokeless gun powder is in use in shot guns which is a combination of 80% of black powder and 20% of smokeless powder. Smokeless powder is ordinarily used

in the cartridges of rifles (nitrocellulose or a combination of nitrocellulose and nitroglycerine). The black powder produces 200-300 ml. of gas per grain. In front of the gunpowder, inside the cartridge case, there is a thin cardboard disc. In front of the cardboard, disc is placed in the wad. The wad is made of soft substance like, felt, cork, straw or rug. In front of the wad, there is another cardboard disc. In front of this disc, the pellets are placed. The pellets are spherical projectiles used in shotguns. Their size may be variable, according to the need and make. One ounce of pellets may consist of 6 to 2,600 of them. In front of the pellets there is another cardboard disc on the anterior margin of which the anterior margin of the cartridge case is twisted. The functions of the wad are to give compactness to the gunpowder, to prevent admixture of propellant charge and the pellets and prevent leakage of the gas produced after the firing. Wad also cleans the inner surface of the barrel after the pellets pass out through the barrel. To facilitate this cleaning, some greasy material is soaked in the wad. In between the propellant charge and the wad there is a cardboard disc so that the greasy substance in the wad will not be soaked by the propellant charge and become useless. In between the wad and the pellets there is a disc which in one hand prevents impregnation of the pellets in the soft wad and on the other, prevents leakage of the greasy substance from the wad in the pellets which would otherwise become adhesive to each other losing their dispersion capacity. The anterior – most disc, placed in front of the pellets, give compactness to the pellets and the whole content of the cartridge case.

Shots of different sizes are suitable for different purposes. Accordingly "Buck shots" or "Bird shots" have different sized shots or pellets for hunting wild birds or other prey. In some cases instead of multiple pellets a single shot or metallic ball, usually made up of lead, is used. "Rifled slugs" are single shot projectiles for shot guns with prominent parallel grooves on the surface."

26. In this book, the assessment of the direction of firing from the margin of the wound of the entrance has also been given, which reads thus: p 257

> Assessment of the direction of firing from the margin of the wound of entrance—
>
> (i) (a) In case of shotgun injury, the pattern of dispersion of the pellets give the direction of the firing. The pellets disperse over a wider area as it travels more. Hence firing is suspected to have been from the side opposite to the side of wider dispersion of the pellets …

27. *"Firearms in Criminal Investigation and Trials" was written by a distinguished professor Dr. B.R. Sharma***.** He has written in some detail about 12 bore guns. This book also defines Pellet Pattern which reads thus: p 204

> **Pellet Pattern**.—The area covered (pellet spread) by the pellets fired from a shotgun is proportional to the distance between the muzzle of the firearm and the target. Greater the range, greater is the area covered by the pellets. The spread of the pellets is affected mainly by the length of the barrel of the firearm and its muzzle characteristics (whether it is choked or not). The condition of the ammunition also affects the results. If experiments are performed with the same firearm and ammunition of the same make and batch, the test patterns provide fairly accurate estimates of the range.
>
> Generally, the whole charge enters the body *en masse* up to a range of about two metres in a factory-made 12-bore shotgun. It forms a rat-hole of about two to six centimetres in diameter. The rat-hole is surrounded by individual holes when the range of fire is about two to seven metres …

28. The trial court stated that in the FIR itself it is mentioned that the injuries to Brij Raj Singh were by pellets and that of the deceased by a bullet. The Ballistic Expert has stated that the cartridge containing pellets cannot contain a bullet.

Accordingly, the trial court reasoned that two weapons were used.

29. The Ballistic Expert is a disinterested, independent witness who has technical knowledge and experience. It follows that the trial judge was fully justified in placing reliance on his report.

30. The trial court also observed that removing the body of the deceased from the place of occurrence creates doubt that the prosecution was planning to substitute another story for the real facts. As such, the possibility that the deceased and his group were the aggressors is not ruled out. It is possible that *pharsa* and *lathi* blows had made the marks that were found on the gun. The gun may have snatched all of a sudden, causing it to fire upon the deceased and Brij Raj. Under the circumstances of the case, the use of another weapon, which had caused injuries to Brij Raj Singh PW-2, is also not ruled out.

31. The trial court further observed that the substratum of the prosecution story about the injuries to Brij Raj Singh is not established beyond reasonable doubt and the story of shooting the deceased by the same shot fired by the accused is not separable from other doubtful evidence of eye-witnesses. The circumstances show that the possibility of aggression on the part of the complainant side is not ruled out, then the benefit of doubt for killing the deceased by the accused would also go to the accused.

32. The trial court also found force in the plea of right of private defence as set up by the accused. The trial court mentioned that there is force in this argument where the circumstances of the case show that two firearms were used in the occurrence. The accused was all alone in his house at that time. The availability of a second weapon is possible only when the complainant side had brought it to the scene. This circumstance supports the defence case, that the complainants' side was the aggressor and they had come armed with weapons to the scene. It follows that the accused would apprehend grievous hurt and danger to his life. Accordingly, the right of self-defence was open to him.

Main reasons for acquittal by the trial court:

38. The trial court acquitted the accused for the following reasons:

1. The prosecution story of single shot injury to two persons one standing horizontally and the other vertically stands totally discredited by the medical and the evidence of Ballistic Expert.
2. According to the FIR, the deceased received a spherical ball (ball shot) bullet injury and Brij Raj Singh PW-2 received pellet injuries. The accused's gun had a cartridge that could only contain pellets. The Ballistic Expert has clearly stated that a cartridge containing pellets cannot contain a bullet. As such, it appears that two weapons were used.
3. Dr. Ram Kumar Gupta, PW-5 who conducted the post-mortem of the deceased, clearly stated that the deceased received injuries from a bullet whereas Dr. Govind Prasad Bakara who had examined Brijraj Singh PW-2 clearly stated that both injuries were caused by a pellet. Therefore, according to medical evidence coupled with the evidence of the Ballistic Expert, two firearms must have been used.

   This version is quite inconsistent with the prosecution story.
4. The injuries received by Brij Raj Singh PW-2 were from the back side and the injury received by the deceased was from the front side and this shows that two weapons may have been used.
5. Removal of the body of the deceased from the place of occurrence also created doubt with regard to the veracity of the prosecution version.
6. The possibility that the deceased and the complainant's side were aggressors and had gone there and caused *pharsa* and *lathi* blows on the accused cannot be ruled out because

of the marks on the gun Ex. 3. That the said gun was fired in snatching all of a sudden, injuring the deceased also cannot be ruled out from the circumstances of the case.

7. The trial court did not discard the defence version of right of private defence as pleaded by the accused.
8. The trial court observed that it is difficult to separate falsehood from the truth, where some material aspects of the occurrence seem to have been deliberately withheld. It is a well-established principle of criminal jurisprudence that when two possible and plausible explanations co-exist, the explanation favourable to the accused should be adopted.

Main reasons for reversal of acquittal order:

39. The High Court gave the following reasons for setting aside the acquittal:

1. A perusal of the post-mortem report goes to show that autopsy conducted on the dead body of the deceased revealed ante-mortem gunshot wound of entry 2.5 cm x through and through on right side neck 2 cm lateral to midline of neck front aspect having corresponding wound of exit 5 cm x 4 cm on right side back of neck 5 cm below right ear. Therefore, this injury was almost horizontal.
2. Medical examination of injured Brij Raj Singh revealed a round lacerated wound of entry 0.3 cm x 0.5 cm on right side back 10 cm away from midline and 9 cm below lower border of scapula having wound of exit 1.5 cm x 0.5 cm x 0.5 on right side back 0.8 cm away and lateral from injury No. 1. Thus, this injury was also almost horizontal.
3. The observation made by the trial judge that firearm injury caused to the deceased was vertical and to that of Brij Raj Singh horizontal is wholly fallacious.
4. A layman does not understand the distinction between a cartridge containing pellets and the bullet. In common parlance, particularly in villages when a person sustains injuries by gunshot, it is said that he has received '*goli*' injury. Ghurey Lal fired at his uncle with his gun causing him *goli* (bullet) injury and Brij Raj Singh also received pellet (*chharra*) injury which goes to show that injuries received by them were caused by two different weapons. There is hardly any difference between bullet and pellet for a layman. From 12 bore gun cartridge is fired and 12 bore cartridge always contain pellets though the size of pellets may be different.
5. A perusal of the post-mortem reports goes to show that autopsy conducted on the dead body of the deceased revealed ante-mortem gunshot wound of entry 2.5 cms. through and through on right side neck 2 cm lateral to midline of neck front aspect having corresponding wound of exit 5 cm x 4 cm on right side back of neck 5 cm below the right ear. Therefore, this injury was almost horizontal.
6. The medical examination of injured Brij Raj Singh revealed a round lacerated wound of entry 0.3 cm x 0.5 cm on right side back 10 cm away from midline and 9 cm below lower border of scapula having wound of exit 1.5 cm x 0.5 cm x 0.5 cm on right side back 0.8 cm away and lateral from injury No. 1. Thus, this injury was also almost horizontal.
7. The learned trial judge had noted the evidence of B. Rai, Ballistic Expert, C.W. 1 that both the injuries would have been caused by two shots. While B. Rai, Ballistic Expert, C.W. 1 had given the said opinion, he had also stated in his cross-examination by the prosecution that if the assailant fired from place 'C' and the person receiving pellet injury standing at place 'B' would have turned around, on

dispersal of pellets he could have received the pellet injuries if deceased and injured both would have stood in the same line of firing.

Our conclusions:

40. *We disagree with the High Court. Admittedly, the deceased died of a bullet injury whereas Brij Raj Singh, PW-2 received pellet injuries. It is well- settled that a cartridge cannot contain pellet and bullet shots together. Therefore, the injuries on deceased and injured PW-2 clearly establish that two shots were fired from two different firearms.*

73. In light of the above, the High Court and other appellate courts should follow the well-settled principles crystallised by number of judgments if it is going to overrule or otherwise disturb the trial court's acquittal.

1. ***The appellate court may only overrule or otherwise disturb the trial court's acquittal if it has "very substantial and compelling reasons" for doing so. A number of instances arise in which the appellate court would have "very substantial and compelling reasons" to discard the trial court's decision. "Very substantial and compelling reasons" exist when:***
   - ***(i) The trial court's conclusion with regard to the facts is palpably wrong;***
   - ***(ii) The trial court's decision was based on an erroneous view of law;***
   - ***(iii) The trial court's judgment is likely to result in "grave miscarriage of justice";***
   - ***(iv) The entire approach of the trial court in dealing with the evidence was patently illegal;***
   - ***(v) The trial court's judgment was manifestly unjust and unreasonable;***
   - ***(vi) The trial court has ignored the evidence or misread the material evidence or has ignored material documents like dying-declarations/report of the Ballistic expert,***
   - ***(vii) This list is intended to be illustrative, not exhaustive.***
2. ***The Appellate Court must always give proper weight and consideration to the findings of the trial court.***
3. ***If two reasonable views can be reached – one that leads to acquittal, the other to conviction – the High Courts/appellate courts must rule in favour of the accused.***

78. On careful analysis of the entire evidence on record, we are of the view that the reasons given by the High Court for reversing the judgment of acquittal are unsustainable and contrary to settled principles of law. The trial court has the advantage of watching the demeanour of the witnesses who have given evidence, therefore, the appellate court should be slow to interfere with the decisions of the trial court. An acquittal by the trial court should not be interfered with unless it is totally perverse or wholly sustainable.

79. On consideration of the totality of the circumstances, the appeal filed by the appellant is allowed and the impugned judgment passed by the High Court is set aside. The appellant would be set at liberty forthwith unless required in any other case.

8.20.5 Accidental or Homicidal Firing[24]

Author's Summary

It is a case of gunshot injuries. There were 3 injuries on the victim. The medico-legal experts gave vacillating opinion on the firearm injuries. However, the SC on the basis of presence of pellets, the nature of damage, the number of shots (2) and clear evidence of the eyewitnesses showed it was a case of attempted murder. It rejected defence plea that as there was no strong motive, nor the victim shot at vital part and that therefore it was a case of accident.

Highlights italicised

Relevant Extracts (Verbatim)

2. Satyavir Singh, appellant-accused was tried for an offence under section 307 of the Indian Penal Code, 1860 (hereinafter referred to as the 'Code') and sections 25/27 Arms Act, 1959 (for short the 'Act') in the Court of Assistant Sessions Judge, Bulandshahr, and was found guilty for both the offences. After hearing the accused on the question of sentence, the Court awarded him three years R.I. under section 307 of the Code and one year R.I. under section 27 of the Act. Both the sentences were ordered to run concurrently. Upon appeal by the accused, the learned 1st Additional Sessions Judge at Bulandshahr set aside the judgment and sentence and while partly allowing the appeal by its judgment dated 6 November 1980 acquitted him of both the charges for which he was convicted by the learned Assistant Sessions Judge, Bulandshahr and only convicted him for offence under section 25(1)(a) of the Act and sentenced him to imprisonment till the rising of the Court. With the leave of the High Court, the State preferred an appeal against the judgment of acquittal. The High Court of Judicature at Allahabad *vide* its judgment dated 20 October 2008 set aside the order of acquittal and while allowing the appeal partly, it convicted the appellant under section 307 of the Code and declined to interfere with the sentence awarded by the First Appellate Court in relation to an offence under section 25 of the Act. Legality and correctness of the judgment and order of sentence passed by the High Court is questioned by the appellant-accused in the present appeal under Article 136 of the Constitution of India *inter alia* but primarily on the following grounds:

(a) The High Court has erred in law in setting aside the judgment of acquittal recorded by the First Appellate Court, which was reasoned one and based on a proper appreciation of evidence. Thus the High Court ought not to have upset the judgment of acquittal. Therefore, the High Court has acted beyond the limitations on such exercise of power and heavy reliance is placed on the case of *Ganesh Bhavan Patel v State of Maharashtra*, (1978) 4 SCC 371 : AIR 1979 SC 135 : 1979 Cr LJ 51.

(b) No motive was proved and in absence of a specific motive, the High Court has erred in holding that the appellant is guilty of offence under section 307 of the Code.

(c) The expert evidence being at variance and the medical evidence not supporting the injuries allegedly found on the person of the victim, the benefit of doubt should have been given to the accused as the prosecution had failed to prove its case beyond reasonable doubt.

24. *Satyavir Singh v State of Uttar Pradesh,* AIR 2010 SC (Supp) 651.

(d) The Court should have appreciated that it was an accidental firing and the prosecution had not put forth any explanation on record as to how the weapon (double barrel gun) was broken.

* * *

5. Facts: Bhanu Prakash Sharma, (PW-1) was taking tea at Hamid Khan's Hotel at about 2.30 pm. His brother Dharam Prakash (PW-3) arrived at the crossing towards Narora Bus Stand. Dharam Prakash aged about 18 years was a student of Khurja Polytechnic. Satyavir Singh, accused is the resident of village Niwari. Vijav Singh is his elder brother and owned a double barrel gun under a valid licence. It is the case of the prosecution that the fields of farmers in village Niwari were irrigated by tubewell of Prem Shankar Thakur. A road was constructed for the power house due to which some farmers of village Niwari started irrigating their fields from the tubewell of Bhanu Prakash Sharma (PW-1), resident of village Jairampur Bangar. This caused some displeasure to Prem Shankar Thakur, father of Satyavir Singh, the accused. At about 2.30 pm on 9 February 1975 said Bhanu Pratap Sharma was taking tea in the Hotel of Hamid Khan at Chauraha of the village. Dharam Prakash came from the side of Narora Bus Stand. The accused on seeing Dharam Prakash, who ultimately examined as PW-3, challenged him by saying that how he was irrigating the fields of villagers from his tube-well. The accused, as already noticed, was armed with a licenced gun of his brother. The accused thereupon fired two bullets from that gun on Dharam Prakash.

Dharam Prakash was medically examined on that very day by Dr. Suresh Chandra Singh (PW-5) and the following injuries were noticed:

Injuries:

(1) Lacerated wound 1 cm X 1 cm X thickness of the left upper arm, on the left upper arm front aspect in the upper part. There are four abrasions each l/4 cm X l/4 cm on its lower and outer aspect. Suspected underneath Adv. X-ray. The margins of the wound are inverted.

(2) Lacerated wound l.5 cm X l.5 cm X thickness of the left upper … on the back aspect of the left upper arm 2 cm. Above the elbow … Suspected underneath. Adv. X-ray. The margins of the wound are inverted.

(3) Lacerated wound 7.5 cm X 3.5 cm on the left forearm upper half-inner aspect. It is bone deep. Suspected fracture underneath. Adv. X-ray.'

These findings were set aside by the learned First Appellate Court which stated that it was an accidental firing and the prosecution has failed to prove its case. The benefit was given to the accused primarily on certain surmises and conjectures and doubting the presence of the witnesses particularly Ram Shankar whose presence had been admitted by the accused himself in the report lodged by him and even in his explanation before the Court.

21. *Definite doubts or lacunae in the case of the prosecution may result in benefit of doubt being given to the accused and consequential acquittal. However, such doubts and lacunae must be clearly distinguished from doubts or lacunae based upon certain assumptions. In such cases what appears to be loop-hole in the case of the prosecution at the first glance, on appropriate examination and appreciation of evidence, may fall in the other class. The following observations of the learned First Appellate Court clearly demonstrates that Court has founded its judgment of acquittal more on surmises and suspicion and the views of the Court which were not supported by evidence on record.*

Illustratively, the following observations can usefully be noticed:

(a) It is evident that left arm is not a vital part. If appellant was fired from a close range within 4 feet, he could have easily aimed at the chest of the victim, which could have killed him at the spot.

(b) But when the motive alleged is the very genesis or commencement of the prosecution story, it would not be possible to discard the defect relating to motive or genesis in the prosecution story.

(c) The third important feature of the case is the simultaneous presence of Bhanu Prakash, Dharam Prakash and Ram Shanker at the crossing.

(d) Then the only possible inference is that they were together at the crossing or at the tea stall for some other reason and as soon as they saw appellant Satyavir Singh, a young man along with a gun, they were tempted to snatch the gun.

According to medical evidence the very seat of the injuries discloses that the shots would have been fired during snatching.

* * *

20. The above observations demonstrate that the learned First Appellate Court has proceeded on the basis of certain presumptions which in the opinion of the Court could be the correct approach. But such approach may be guided by the doctrine of perversity. If findings are neither supported by evidence nor such approach could be adopted by the person of common prudence or behaviour, then the court may interfere in a judgment of acquittal. The First Appellate Court is a court of both fact and law and as such has jurisdiction to entirely re-appreciate the evidence. Thus, while setting aside the order of conviction it has to equally ensure that no injustice is done and on certain assumptions of facts, guilty may not go scot free. A person otherwise is proved to be guilty by the prosecution by leading cogent and reliable evidence, normally would not be given the benefit of doubt on the basis of certain assumptions or presumptions of facts. The Court may have to notice and rely upon behaviour of the person of a common prudence only where the direct evidence have been produced. As we shall shortly proceed to discussion *that the assumptions raised by the First Appellate Court are not supported on record. We find that the High Court has not fallen in error of law in setting aside the order of acquittal and affirming the judgment of conviction rendered by learned trial court.*

21. Now we may proceed to examine the appreciation of evidence on record by the First Appellate Court acquitting the accused as well as that of the High Court reversing the judgment of acquittal.

24. The High Court noticed that the fields of farmers in village Niwari were irrigated from the tubewell of Prahalad Singh Thakur which was installed in that village. It was because of construction of the road for the Power House that the farmers of village Niwari started irrigating from the tubewell of Bhanu Prakash Sharma resident of Village Jairampur Bangar. This was not bearable to the accused who is the son of Prahlad Singh Thakur. Thus, this may not be exactly a motive but was a reason enough for the accused to take an offensive step against the injured.

23. The first information report was lodged by Bhanu Prakash Sharma without any delay and as already noticed Dharam Prakash (PW-3) had been challenged by the accused saying that how he was irrigating the fields of the villagers of his village from his tubewell. Armed with a licensed gun of his brother, he opened fire on Dharam Prakash and shot two bullets. The occurrence was seen by Bhanu Prakash Sharma (PW-1), who was present there as well as Rama Shankar (PW-4) and some others. The accused was arrested and the gun was also deposited. Ext. Ka-1 report to the police station was lodged by Bhanu Prakash Sharma (PW-1).

Dharam Prakash was medically examined on 9 February 1975 at about 4.35 pm and according to Dr. Suresh Chandra Singh (PW-5), three injuries were found on the injured who was then subjected to X-Ray by Dr. A.K. Aggarwal (PW-8), who was posted as Radiologist in District Hospital, Bulandshahr. It has been proved on record by Dr. Jitendra Singh Sharma (PW-7) that Dharam Prakash remained in the hospital from 9 February 1975 to 20 March 1975.

25. *The medical evidence clearly reflected that the injuries could be caused by gun shots. However, there was little difference of opinion between two doctors but both these doctors are not ballistics experts so as to provide any expert opinion which could safely be relied upon by the Court while deciding the case.*

26. *The difference of opinion between experts necessarily may not persuade the Court to adopt one approach or the other particularly when none of the experts are persons competent to express opinion on that subject. The difference of opinion between two doctors which, in the facts and circumstances of the present case, does not have any material bearing on the case of the prosecution is not such a formidable submission which has to be accepted by the Court to grant necessarily the benefit of doubt to the accused.*

It was stated by Dr. Suresh Chandra Singh (PW-5) that such injuries could be caused by gun shots. The trial court and the High Court expressed in unambiguous language the view that it was possible that no gunpowder was traced around the wounds of the injuries as he was wearing clothes. This finding cannot be said to be erroneous. Dr. A.K. Agarwal (PW-8) clearly stated that the pellets of the fire shots were found in the wounds and were duly seen in the X-Ray of the injured. Thus such view taken by the courts cannot be faulted. *In fact the major part of the occurrence is not even disputed by the accused in his statement under section 313 of Cr PC and in any case the report lodged by him bearing No. 27A/75 clearly shows that the incident occurred and the injured besides, other two witnesses, PW-1 and PW-2 were present at the spot. In fact according to the accused it was an accidental fire which occurred as a result of snatching of the gun by the injured and other persons accompanying him at that time.* While, according to the prosecution he had fired two shots which injured the victim and thereafter the gun was snatched. Dr. Suresh Chandra Singh (PW-5) examined the injuries of the injured and stated that injuries would have been caused 2-3 hours earlier and that when the injured was brought to the hospital, he was bleeding and such injuries could be sustained by gun shots. This statement of the doctor had fully supported the case of the prosecution and chain of events as stated therein.

29. With considerable emphasis, learned counsel for the appellant argued that as no explanation was rendered by the prosecution as to how the gun had broken, this would straightaway cause serious dent in the case of the prosecution and entitles the accused for an acquittal.

30. We find no merit in the aforesaid contention. It was for the accused to prove his defence as the prosecution is liable to prove the case as stated in the first information report and the report filed by it under section 173 of Cr PC The eye-witnesses had actually seen the victim being injured by the shots fired by the accused. In fact the accused was apprehended at the spot with the gun. The gun in question was admittedly a double barrel gun and the same was used by the accused while firing two shots. The gun with the spent cartridges were taken into custody *vide* Ext. Ka-3. The accused himself had lodged the report bearing No. 27A/75 under section 394 of the Indian Penal Code against the eyewitnesses including Bhanu Prakash Sharma, Dharam Prakash, Rama Shankar and one

unknown person. The report lodged by the accused, itself shows as to how the gun was broken. But the breaking incident took place after the two shots had been fired by the accused upon the injured. There appears to be no justifiable reason as to why the eye-witnesses PW-1 and PW-4, who even according to the accused were present at the place of occurrence, should be disbelieved.

It could be safely construed from the evidence on record that the accused may not have any strong motive to kill the victim, however, the loss of revenue on account of the fact that water for irrigation was being provided by the father of the injured, was reason enough for the accused to show his anger or it was not acceptable to him, as stated by the witnesses, thus he fired two shots which resulted in causing injuries to Dharam Prakash.

Both the reports were lodged by the informant as well as the accused at 2.30 pm on 9 February 1975. The gun and the utilized bullets were given at the police station itself. This evidence clearly shows that the prosecution has not failed in proving its case in accordance with law.

31. As already noticed, part of the occurrence stands admitted and it is only the limited aspect of the case as to whether the firing was accidental or the accused had intentionally fired on the injured. Statement of the eye-witnesses, medical evidence and the investigation conducted by the Investigating Officer clearly show that the prosecution has been able to prove its case beyond reasonable doubt. The act of firing gun shots at the injured obviously shows that the accused had the knowledge that by such an act he may even cause the death of the injured and actually caused hurt to the victim. It is a matter of co-incidence that the gun shots did not injure Dharam Prakash at any of his vital organs.

32. Learned counsel appearing for the appellant while referring to certain discrepancies appearing in the statements of the witnesses including the doctors, vehemently contended that it was a case of acquittal and there was no intention on the part of the accused to kill the injured otherwise he would have fired the gun shots at the vital parts of the body of the injured, particularly when according to the prosecution, it is stated that the firing took place from a close distance. If that was so, such injuries would not have been caused. This contention also does not impress us inasmuch the tattooing and charring shall always depend upon the constituents of the propellant charge and it is in that context only wounds are classified by their external appearance as close contact. Reference can be made to *Bano Prasad v State of Bihar*, (2006) 12 Scale 354 : 2007 AIR SCW 807 : AIR 2007 SC 1021.

* * *

The cumulative effect of the above discussion is that we do not see any reason to interfere with the judgment of the High Court. The High Court has not exceeded its jurisdiction in law and with reference to the evidence on record while reversing the judgment of acquittal to one as that of conviction. So far as the conviction of the accused under section 25(1) of the Act is concerned, no arguments were addressed. In any case we see no reason to interfere with the said finding of the courts below.

35. In the result, the appeal fails and is dismissed.

8.20.6 Medico-legal expert No Ballistics Experts[25]

Author's Summary

It is a case of murder. Two culprits had guns and fired 4 shots. The victim died at the spot. The accused alleged that they have been framed. The medical evidence and the eyewitness accounts were at variance. The doctor found bullet injury on the deceased whereas the accused had only 12 bore shotguns. The SC rejected the argument and ruled:

"The Medico-legal expert is not ballistic expert. He was not expected to answer as to whether injury No. 1 could have been caused by bullet alone."

Highlights italicised

Relevant Extracts (Verbatim)

Put briefly the prosecution case is as follows:

On 19 February 1977 at about 4.45 pm the accused Ram Samujh and Mahmood appellant No. 1 both armed with guns, Khalid-appellant No. 2, Bajrang and one unidentified person armed with *lathi* assaulted deceased Ram Singh at Galiyara near the fields of Ram Sewak Ahir, while he was returning to his village Badipur on his motorcycle. It was alleged that the accused Ram Samujh and Mahmood fired four shots, as a result of which the deceased fell down injured and thereafter Khaliq snatched the licensed revolver belonging to the deceased and all the five fled away from the scene. Ram Singh died on the spot. The incident of murderous, attack was witnessed by Jaikirat Singh (PW-1) who is none other than the son of deceased-Ram Singh, Ram Ratan (PW-2), resident of village Sujerpur hamlet of Bodipur and Ram Adhar (P.W3). PW-1 lodged written First Information Report Ext Ka. 1 on the same day at 4.45 pm naming all the accused and the manner in which the murderous attack on the deceased had taken place, Jagdamba Prasad Dwivedi (PW-7) the office in-charge of Police station, Kothi rushed to the scene of offence at about 6.00 pm and found the dead body of Ram Singh and his motorcycle in *galiyara* near the fields of Ram Sewak Ahir. The broken pieces of the skull of the deceased and broken three teeth were seized from the place of occurrence. The discharged cartridge and tickli were also seized from the spot. PW-7, after preparing the Inquest Report (Ext. Ka. 7), sent the dead body for conducting post-mortem, Dr. R.S. Katiyar PW-5 performed the autopsy on the dead body on 20 February 1977 at about 9.45 am and found as many as five ante-mortem gunshot wounds. A cap of cartridge (top wad?) was extricated from the brain of the deceased. Scalp bones were found fractured. It was found that vital organs like peritoneum, liver, kidneys were badly ruptured. In the opinion of the doctor, the cause, of death was due to shock and haemorrhage resulting from ante-mortem injuries. The investigation of the case was transferred in the first week of March, 1977 to CB 'CID, Inspector M.L. Gautam having completed rest of the investigation submitted charge-sheet against the appellants and other accused.

The accused have denied the charges framed against them and took the plea that they have been falsely implicated due to enmity. The accused were accordingly put on trial. The prosecution in order to establish its case in altogether examined 8 witnesses and got marked 39 documents as Exts. Ka. 1-39. Amongst the witnesses examined by the prosecution, Jaikirat Singh, Ram Ratan and Ram Adhar (P.Ws. 1, 2 and 3) respectively were eyewitnesses to the

25. *Mahmood v State of Utter Pradesh,* AIR 2008 SC 515 : 2007 AIR SCW 7385 : 2008 Cri LJ 696 (SC).

murderous attack on the deceased. The accused also led evidence and examined Virendra Singh DW-1, Laxmi Narain Sinha DW-2 and Bindra Charan DW-3.

The learned Sessions Judge upon the appreciation of the oral evidence and material on record found all the accused guilty of the charges framed against them and sentenced them to various terms of imprisonment. On appeal the High Court of Allahabad confirmed the conviction and sentences imposed by the learned Sessions Judge. The appellants who are accused Nos. 2 and 3 respectively alone have preferred this appeal by special leave, challenging their conviction and sentence.

The prosecution story entirely rests upon the direct evidence of PW Nos. 1, 2 and 3. PW-1 is none other than the son of deceased Ram Singh. He was present in his fields situated nearby the place of occurrence where his father was attacked, Jaikirat (PW-1) no doubt was doing his part time G.N.S. in plantation at Lucknow but that itself would not make his presence doubtful at the scene of offence on the fateful day. The defence did not elicit anything in the cross-examination casting any doubt about the presence of PW-1 at the scene of offence. There is nothing unnatural about the conduct of PW-1 at the scene of occurrence. He gave a detailed version as to the manner of assault and the role played by each of the accused. The names of PW-2 and PW-3 were also mentioned as eyewitnesses in the First Information Report itself. In the circumstances, PW-2 and PW-3 cannot be treated as chance witnesses. The Trial Court and as well as the High Court did not commit any error in relying on the testimony of PW-2 and PW-3 as eyewitnesses of the occurrence which fully stands corroborated with the testimony of PW-1. Be that as it may, there was not even a suggestion to PW-2 and PW-3 that they had animosity towards the accused persons. They are independent witnesses and there is no reason for them to speak against the accused.

However, it was strenuously urged that the presence of Jaikirat (PW-1) at the scene of offence is highly doubtful as he made no attempt whatsoever to save his father from being further assaulted. We find no substance in this contention. It is in the evidence of Jaikirat (PW-1) that all the four shots were fired in quick succession and at that moment PW-1 was at some distance from the actual place of attack. Be it noted that at least 2 accused were armed with firearms and one with lathi and they were using the weapons with all impunity. In such circumstances, Jaikirat (PW-1) may not have mustered his courage to jump into the fray and risk his own life. It is very difficult to predict or express any opinion as to what could have been normal or natural conduct of a person in such a situation. The response of individuals in such situations may differ from person to person. It is not possible to reject the evidence or doubt the presence of PW-1 on that ground.

The post-mortem examination of the deceased Ram Singh was performed by Dr. R.S. Katiyar (PW-5). The post-mortem report is exhibit Ka-4. The Medico-legal expert found the following ante-mortem injuries on the person of the deceased:

1. A gunshot wound (wound of entry) 3 cm x 1 cm found over left side of face just above the left side of the lower lip. Wound of Ext. 3 cm x 2 cm. over the right parietal bone, 7 cm. above the right ear.
2. A gunshot wound 2.5 cm x 1 cm. over the right side of face below max. prominence.
3. Multiple gunshot wounds in an area of 13 cm. x 11 cm. over the right side of back below the inferior angle of scapula.
4. A gunshot wound (wound of entry) 2 cm. x 2 cm. over the right side of the back 2 cm. Right to 12th thoracic vertebra.
5. Multiple gunshot wounds in an area of 9 cm. X 4 cm. over the back and middle of right arm.

Relying on his evidence the learned counsel for the appellant contended that the oral account as given by PW-1, 2 and 3 is at variance with medical evidence available on record. It is contended *that while according to the eye-witnesses all the four shots were fired from the gun, from right side of the victim, wound No. 1 (wound of entry) was on the left side of the face and caused by bullet and this evidence belies the claim of eye-witnesses that they saw the assault on Ram Singh. It is true that to a pointed query in cross-examination as regards the nature of injury No. 1, the Medico-legal expert stated that the said injury was caused by bullet only.* ***The learned counsel contended that weapons in the hands of the Accused even according to PW-1 were of 12 bore guns and not any pistols or revolvers. No bullet injury could have been caused with the firearms that were alleged to be in the hands of the assailants. We find no substance in this submission. The Medico-legal expert is not a ballistic expert. He was not expected to answer as to whether injury No. 1 could have been caused by bullet alone. His opinion to that extent is of no consequence.*** *It is well-settled that medical evidence is only an evidence of opinion and it is not conclusive and when oral evidence is found to be inconsistent with the medical opinion, the question of relying upon one or the other would depend upon the facts and circumstances of each case. No hard and fast rule can be laid down therefor. The ocular evidence if otherwise is acceptable has to be given importance over medical opinion. However, where the medical evidence is totally improbableles the ocular version, the same can be taken to be a factor to affect credibility of the prosecution version. We are not inclined to place any reliance upon the opinion of the Medico-legal expert that the injury No. 1 could have been caused only with bullet since he is not a ballistic expert. This part of the evidence of the Medico-legal expert cannot be considered to be the opinion of an expert and the same has no evidentiary value. It is not possible to disbelieve the evidence of PWs.-2 and 3 and their presence at the scene of occurrence based on the medical evidence. The High Court rightly observed that the controversy as regards injury No. 1 and whether the same could have been caused by bullet or pellet to be without any basis.*

The learned counsel for the State rightly contended that in case of attack by members of unlawful assembly on the victim in furtherance of common object, it is not necessary for the prosecution to establish overt act done by each accused. It is required to be noticed that Ram Singh (A-1) who had fired two shots, convicted by the Sessions Court, did not even challenge his conviction in the High Court. The appellants have been rightly convicted under section 302 read with aid of section 149 of IPC PW-5 in his evidence stated that all the injuries sustained by the deceased were from gun. It is further stated that from the body of deceased one bullet, one cover *tikli*, two dat and 40 '*chare*' shots were taken out, put in packet and sealed … "It is also stated in his evidence that injuries caused on the body of the deceased were sufficient in the normal course to cause death. This part of the medical evidence if juxtaposed with the oral evidence of PWs-1, 2 and 3 it becomes unnecessary to go into the question as to which accused caused what injury and which was a fatal one. Once a membership of an unlawful assembly is established, it is not incumbent on the prosecution to establish any specific overt act to any of the accused for fastening of liability with the aid of section 149 of the IPC. Commission of overt-act by each member of the unlawful assembly is not necessary. The common object of the unlawful assembly of the accused in the present case is evident from the fact that some of them were armed with deadly weapons. None of them were curious onlookers or spectators to the macabre drama that was enacted on 19 February 1977 at 3.30 pm at galiyara, village Badipur.

For the aforesaid reasons, we find no merit in this appeal. The appeal is accordingly dismissed.

8.20.7 Close-range Phenomena[26]

Author's Summary

It is a case of murder of wife with a revolver and an extraordinary conviction on circumstantial evidence, maintained by the SC. There were no eyewitnesses, the firearm was not linked to the culprit or to the bullet recovered from the victim.

The evidence relied upon was that the culprit had written a threatening letter, the firing was a close-range phenomenon and there was no possibility of any other person to be nearby. The SC ruled out Suicide

Highlights italicised

Relevant Extracts (Verbatim)

The prosecution case is when the deceased had gone upstairs with the dinner of the respondent, a sound of a gunfire was heard by the informant at the first floor. PW-3 rushed to the second floor immediately and found the deceased lying in a pool of blood on the terrace having a gunshot injury. Allegedly, he exclaimed *"didi ko kisee nei goli mar diya".* Hearing these words, the parents of the deceased also rushed to the second floor and found her lying on the terrace in the pool of blood with a gunshot injury on her forehead. The Respondent was seen hiding something by PW-2. When the mother of the deceased Gouri Devi (PW-2) took the deceased's head on her lap, the respondent also came out. She was brought downstairs and taken to a nursing home. The Respondent was also said to have accompanied them in a rickshaw. She was declared dead. Before the deceased was taken to the nursing home, PW-2 had locked the room from outside.

Information about the said incident was lodged by Raj Kumar Prasad Tamarkar, the father of the deceased (PW-13).

The investigating officer, on opening the lock, found a revolver from which smoke was still coming out. It was found from the bedstead of the room.

The respondent was arrested. Principal witnesses examined on behalf of the prosecution to prove the offence against the respondent before the learned Sessions Judge were PW-2, PW-3 and PW-13, mother, brother and the informant-father of the deceased respectively. Indisputably, they were present in the house when the occurrence had taken place. The autopsy report was prepared by Dr. Kaushlendra Kumar (PW-1) posted at Sadar Hospital, Giridih. He found the following injuries on the person of the deceased:

(i) one circular lacerated wound over glabella (middle of forehead) ½" x ½" cranial cavity deep with inverted margin, blackening and charring was present.

(ii) Cresentric mark over the side of the nose (left) below left eye – nail mark. On further dissection – subcutaneous tissues under the lacerated wound on the forehead in middle *'i.e.* Glabella region and the underlying frontal bone consisted a circular hole ½" x ½" Cranial cavity deep. On further dissection the meninges and the brain were lacerated and terro posteriorly with extracranial blood clot. One bullet was taken out from the posterior cranial fossa. The bullet was sealed and handed over the investigating agency.

Bharti Devi (PW-4) was the aunt of the deceased, *i.e.,* the brother's wife of the informant (PW-13). She was staying in the same house. She deposed that at the relevant time the respondent was staying in the house and he had come asking for Bidai of the deceased. Suresh Kumar (PW-3) is another brother of the informant living in the same house. He was informed by the

26. *Raj Kumar Prasad Tamarkar v State of Bihar,* AIR 2007 SC (Supp) 372 : (2007) 10 SCC 433.

informant that it was the respondent who was responsible for the death of his daughter (the deceased).

Kameshwar Prasad (PW-5) is another brother of the informant who was also living in the same house. He also supported PW-3. Bishwanath Sharma (PW-7) was a neighbour who came to the place upon hearing commotion. To him also the occurrence was reported by the informant. Kali Prasad Sao (PW-8), Shambhu Prasad (PW-9), Surender Sao (PW-10) and Ramdeo Prasad Yadav (PW-11) were witnesses of seizure of a blood-stained revolver from the bedstead of the room which was being occupied by the respondent at the relevant time. Shesil David Khalkho (PW-12) is a Sargeant Major. He had examined the seized revolver and opined that the same had been in a working condition and had been used recently. He examined himself as PW-12.

The learned Sessions Judge on the basis of the aforementioned evidence found the respondent guilty of commission of murder and sentenced him to undergo rigorous imprisonment for life.

The said judgment having been appealed against has been reversed by the High Court by reason of the impugned judgment. The High Court was of the opinion that the circumstance obtained in the prosecution case could not be said to have connected all the links in the chain. The High Court also noticed that there was no eye-witness to the occurrence.

The circumstances which have been found by the learned Sessions Judge to prove the involvement of the respondent in the case are as under:

> *(i) The marriage between the accused-appellant and the deceased was solemnized some time prior to the occurrence and the accused appellant although visited Calcutta in course of his duty but he did not meet his wife Usha Devi, the deceased, in Calcutta while she was residing at her Nanihal at Bhawanipur.*
>
> *(ii) At the time of occurrence in the upstairs of the house only the accused appellant and the deceased were present. There was none other than them.*
>
> *(iii) Soon after the occurrence when the inmates of the house went upstairs hearing the sound of firing, the accused appellant was in the room while the deceased, Usha Devi, was lying with gunshot injury in a pool of blood on the terrace and he was found concealing something inside the bedstead.*
>
> *(iv) On examination of the seized revolver it was found to be an able one and recently it was used as still there was smell of firing in the barrel.*
>
> *(v) The accused-appellant was having some illicit relationship with one lady, namely, Sahnaj and only with the ulterior motive of clearing his path of illicit relationship with Sahnaj, Usha Devi was murdered. A letter to that effect as alleged was written by the accused appellant to the deceased had been proved in the case.*

We have noticed hereinbefore certain admitted facts which we need not advert to once over again.

No positive defence was taken by the respondent. Merely a suggestion was given while cross-examining the prosecution witnesses that the deceased might have been killed by an outsider.

> *Our attention was drawn to a letter dated 30 October 1995 (Ext. 7) written by the respondent to the deceased. In that letter indisputably the respondent had warned the deceased of grave consequences if she continued to accuse him in regard to his affair with Shahnaj.*

The learned Judges of the High Court opined that there was nothing to show that the revolver belonged to the respondent, particularly, when the same had not been sent to a ballistic expert nor the blood which was found thereupon was sent for chemical examination.

The High Court moreover opined that nobody had stated that the revolver was kept in the jhola which was carried by the respondent. It was furthermore observed that the room wherein the respondent was staying cannot be said to be in his exclusive possession and, thus, if anything incriminating had been found therein, the same could not "finger towards the conscious possession" of the respondent. It was furthermore opined that the fired bullet recovered from the body of the deceased having not been sent for chemical examination along with the revolver to prove that the same had been fired from the revolver seized; there remained a gap constituting a missing link.

> *Ext. 7 was proved to be in the handwriting of the respondent. The contents of the said letter are not in dispute. It contained threatening to the deceased. She was warned of grave consequences even to the extent of killing her.*
>
> *The conspectus of the events which had been noticed by the learned Sessions Judge as also by the High Court categorically goes to show that at the time when the occurrence took place, the deceased and the respondent only were in the bedroom and the terrace connecting the same. There was no other person. The cause of death of the deceased Usha Devi i.e., by a gunshot injury is not disputed. The fact that the terrace and the bedroom are adjoining each other is not in dispute.*
>
> *The autopsy report shows that "a blackening and charring" existed so far as injury No. (i) is concerned. The blackening and charring keeping in view the nature of the firearm, which is said to have been used clearly go to show that a shot was fired from a short distance. Blackening or charring is possible when a shot is fired from a distance of about 2 feet to 3 feet. It, therefore, cannot be a case where the death might have been caused by somebody by firing a shot at the deceased from a distance of more than 6 feet. The place of injury is also important. The lacerated wound was found over glabella (middle of forehead). It goes a long way to show that the same must have been done by a person who wanted to kill the deceased from a short distance. There was, thus, a remote possibility of causation of such type of injury by any other person, who was not on the terrace.*

Once the prosecution has been able to show that at the relevant time, the room and terrace were in exclusive occupation of the couple, the burden of proof lay upon the respondent to show under what circumstances death was caused to his wife. The *onus* was on him. He failed to discharge the same.

The observation of the High Court that the respondent had not been proved to be in possession of the revolver cannot be accepted. The respondent at the relevant time was with the deceased. In the event, the death has been caused by an outsider, he could have shouted. He would have been the first person to point out to her in-laws as to from which side the shot was fired. Even he could have been the first person to offer his explanation to the investigating officer. He chose not to do so.

The respondent was found to be hiding something under the bedstead by his mother-in-law. It may be true that PW-3 brother of the deceased when he came to the room shouted that somebody had killed his elder sister but the same would not mean that even if the circumstances are so glaringly pointing out the guilt of the accused and accused alone, the same should be ignored only because of the said statement.

Other brothers of PW-13 including PW-4 came to the spot immediately. PW-7 who was the neighbour also came to the spot immediately after the incident. To them also the respondent did not offer any explanation. To them also he did not say as to how his wife had suffered a gunshot injury.

The prosecution case that while taking the deceased to the nursing home, the mother of the deceased locked the door from outside has not been disputed. The lock of the door was indisputably opened in the presence of the investigating officer. Recovery of the revolver being the weapon of attack is also not in dispute. The fact that the injury could have been caused only by the weapon in question is also not in dispute. The same was not only found to be in working condition, it was also found by the investigating officer as also PW-12 that the same had been used recently.

We may also notice that the defence suggested that the deceased might have committed a suicide. It was furthermore suggested that some family members might have committed the offence. The learned Sessions Judge found, which finding is not questioned before us, that keeping in view the place where the dead body was found, the suicide theory is wholly improbable. The bangles of the deceased were found broken. If she had committed suicide in the room, it was impossible for her to run to the terrace. It was impossible that the pistol would be found hidden under a bedstead in the room which is admittedly at some distance from the place where the deceased was found lying.

It is difficult to accept the submissions of Mr. Banerjee that had the respondent fired the shot, he could have thrown away the revolver. Under what circumstances the respondent did so can only be a subject-matter of surmises. It is well-known that different persons behave differently in a given situation. It is just possible that even if the revolver had been thrown, the same would have been found immediately.

Mr. Banerjee contended that the room was not in the exclusive possession of the respondent. It may be that the room was not in the exclusive possession of the respondent in the sense that he had not been living there permanently but it had not been denied or disputed that at the relevant time the deceased and the respondent were alone in the room. No other person was present there. Even the witnesses were not cross-examined on that behalf. No suggestion even had been given to that effect.

It was argued that if the respondent intended to kill the deceased, he could have done so after 17 July 1996 *viz.,* after Bidai ceremony took place. The very fact that the respondent brought a revolver is itself a pointer to the fact that he wanted to kill the deceased at one point of time or the other. He might have thought that Bidai ceremony would be held on 13 July 1996 or 14 July 1996. When it was postponed, he might have found out an occasion to kill her. Under what circumstances, the occurrence took place is not known. The respondent, it would bear repetition to state, did not open his mouth. He was entitled to exercise the right of silence. That he did not offer any explanation itself may not be sufficient to conclusively hold that he was guilty of commission of the offence, but the legal position that the same would be considered to be a circumstance against him is not in dispute.

It is true that neither any fingerprint expert nor any ballistic expert had been examined. Even the blood found on the revolver had not been sent for chemical examination, but, in our opinion, the same by itself would not negate the circumstances which have proved the guilt of the respondent beyond all reasonable doubt.

For the reasons aforementioned, we set aside the judgment of the High Court and restore that of the learned Sessions Judge. The appeals are allowed. The respondent is sentenced to undergo rigorous imprisonment for life under section 302 of the Indian Penal Code. He may be taken in custody forthwith to serve out the sentence.

8.20.8 Blackening and Inversion of Edges[27]

Author's Summary

It is a case of murder where the postmortem doctor caused confusion. In the PM report he stated, 'the margin of wound charred. A t another point, he in no uncertain terms stated that firing was done from long range and distance of firing would be from more than six feet.

The doctor confused **dirt ring** (can occur from any distance) to **"charring"** and created the comedy of error.

Relevant Extracts (Verbatim)

On 13 December 1999 at about 6.30 am, the deceased was milking a buffalo. His other family members including the wife of his brother (informant Krishna Deo Prasad-PW-7), nephew Sunil Prasad and others were brushing their teeth at the roof of their house. Brijnandan Prasad and others have their joint residential house at some distance from the house of the deceased. They allegedly came over the roof of their house armed with rifles and started brick-batting and abusing the brother of the informant alleging that they had burnt a heap of straw belonging to them. When Shivnandan Prasad went to the roof of the house, allegedly the appellants started firing. One of the bullets hit Shivnandan Prasad on his chest. An alarm was raised. The first informant reached near his brother and found him dead. A First Information Report was lodged at about 10.00 am on the same day before Chandi Police Station.

* * *

The learned Sessions Judge relying on or on the basis of the evidence adduced by the prosecution and in particular the deposition of the eye-witnesses found the appellants guilty of commission of an offence under section 302/34 of the Indian Penal Code and sentenced them to undergo rigorous imprisonment for life. A fine of Rs 5,000 was also imposed upon each of them. They were also found guilty under section 27 of the Arms Act and were convicted to undergo rigorous imprisonment for one year. The appeals preferred by the appellants have been dismissed by a Division Bench of the High Court.

* * *

So far as the contention in regard to distance of firing is concerned, it is true, ordinarily, charring would take place, if firing is done from a distance of less than four feet, as has been noticed in some of judgments of this Court in *Subhash v State of Uttar Pradesh,* (1976) 3 SCC 629 : 1976 Cr LJ 1521 : AIR 1976 SC 1924; *Nath Singh v State of Uttar Pradesh,* (1980) 4 SCC 402; *State of Punjab v Wassan Singh*, (1981) 2 SCC 1 : AIR 1981 SC 697 : 1981 Cr LJ 410; and *Sidharth v State of Bihar*, (2005) 12 SCC 545 : AIR 2005 SC 4352 : 2005 Cr LJ 4499.

In some cases, medical evidence may corroborate the prosecution witnesses; in some it may not. The court, however, cannot apply any universal rule whether ocular evidence would be relied upon or the medical evidence, as the same will depend upon the facts and circumstances of each case. No hard and fast rule can be laid down therefor.

27. *Bano Prasad v State of Bihar,* AIR 2007 SC 1019 : 2007 SCW 801.

It is axiomatic, however, that when some discrepancies are found in the ocular evidence *vis-a-vis* medical evidence, the defence should seek an explanation from the doctor. He should be confronted with the charge that he has committed a mistake. Instances are not unknown where the doctor has rectified the mistake committed by him while writing the post-mortem report, (in the instant case) whereas in the body of the post-mortem report, the medical expert stated, 'the margin of wound charred and inverted' at another point, he in no uncertain terms stated that firing was done from long range and distance of firing would be from more than six feet. The possibility, therefore, of his commission of some mistake in the post-mortem report cannot be ruled out. It was on the said premise, it was incumbent upon the defence to bring the said fact to the notice of the doctor. Probably, knowing the futility of asking such a question, no such contention was raised either before the Sessions Judge or before the High Court. No such ground has also been taken before us.

> *Tattooing or charring shall depend upon the constituents of the propellant charge. It is in that context only wounds are classified by their external appearance as close contact, near contact and distant. The doctor in his evidence was categorical in stating that the wounds would not come within the purview of classification of near contact; but the wounds should be classified under 'distant contact'.*

The authorities like Taylor and HWV Cox in their treatises, state in details as to how the post-mortem examination should be conducted.

The nature of the gun will also have a role to play. Unfortunately, the investigating officer did not make any attempt even to seize the gun. When the weapon was not seized, the question of examination of any ballistic expert would not arise [See *Nirmal Singh v State of Bihar*, (2005) 9 SCC 725].

8.20.9 Common Intention from Injuries[28]

Author's Summary

It is a case of murder where the postmortem doctor found one firearm injury on the deceased. There were no other injuries on the decease or others. Nor was there any evidence(marks) on the crime scene.

No other person suffered any injury. The SC, therefore, did not accept the prosecution plea of common intention with others.

Highlights italicised

Relevant Extracts (Verbatim)

The homicidal nature of the death of the deceased is not in dispute. The autopsy report of Dr. Prabhat Keshaw corroborates the homicidal nature of death. In his deposition, he stated:

"*Rigour mortis* present in all four limbs.

28. *Bano Prasad v State of Bihar*, AIR 2007 SC 1019 : 2007 SCW 801.

Injury No.

i. One lacerated wound on the occipital region on scalp 1½" x 1" x scalp deep.

ii. One lacerated wound on right side of chest at the length of second inter-coastal space 1½" lateral to the external margin 2" x 1" x cavity deep size, margin of wound charred and inverted, wound of entry.

iii. Third rib fractured.

iv. One lacerated wound on left side of back at bare area, just below the lower border of scapula 1½" x 1" x cavity deep size, margin of wound everted, wound of exit. Both injury Nos. II & IV are inter-connected with each other.

On dissection, skull, brain and brain matter intact, right lung perforated, left lung intact, arch of aorata intact contents 3-4 ounces of undigested food materials, liver, splin, both kidneys intact, gasses ficle matters present in small and large intestine respectively. The bladder was half full. Time elapse since death within 24 hours.

In my opinion death occurred due to shock and haemorrhage caused by above-noted injury caused by firearm or may be by rifle. The above-noted injuries are sufficient for death. This post-mortem report is in my pen and signature mark Exh. 4."

In his cross-examination, he stated that the distance of firing was more than 6 feet and was from long range, *i.e.,* beyond 6 feet; although he could not say the exact distance. He, however, could not state that the injury was from parallel height or from higher height. In regard to the presence of *rigour mortis*, it was stated:

> The start of *rigour mortis* depends on the temperature and weather conditions, but in this case *rigour mortis* developed after three hours. In all turn limbs developing of *rigour mortis* take 18 hours in such types of cases.

The deceased met instantaneous death. Although the investigation was conducted in a slipshod manner, but the presence of blood at the spot of occurrence as also seizure thereof had categorically been stated by PW-4, PW-5, 'PW-6, PW-7, PW-8 and PW-2. PW-2, Kapil Prasad is an independent witness. He categorically stated:

"Blood stained soil and brick bats were also seized by the police in my presence and prepared the seizure list".

It is, thus, not correct to say that no blood was found at the spot.

He reiterated his statement in the cross-examination in the following terms:

"The police seized blood stained soil, bricks, in my presence. I cannot say the length and breadth of the bricks. I do not remember the area of the place from where the blood was seized. The soil might be 4-5 hundred grams."

We may also notice that in the First Information Report, it was categorically stated that the appellants herein had indulged in brick batting. The statement to the said effect was proved by PW-4, PW-5, PW-6, PW-7, PW-8 and other eye-witnesses in their depositions before the court. This part of the prosecution is not under challenge before us.

We may also notice the fact that there had been firing from the side of the appellants has not only been disclosed in the First Information Report but also stated by the witnesses. We would, however, examine the effect of the depositions of the said witnesses, in this behalf, a little later.

We may notice that according to PW-3, the firing took place from a distance of about 50-60 feet, whereas according to PW-4, the distance was anything between 40-45 feet. Both PW-7 and PW-8 stated that the distance from which the firing took place was about 40-45 feet.

It is also not in dispute that whereas prosecution witnesses PW-4, PW-7 and PW-8 also stated that the appellants were in the second floor of their house, whereas the deceased, informant and others were in the first floor of their house. However, the difference of height of the respective buildings is not brought on records.

The discrepancies between the medical evidence and ocular evidence, however, as noticed hereinbefore, have been raised on two counts namely, (i) *rigour mortis* in four limbs were found; and (ii) in view of the injury sustained by the deceased, the firing must have taken place from a close distance.

We must, however, state that before the High Court, the second contention was not raised. Even before the learned Sessions Judge the only contention raised was in regard to the time of death and with reference to the presence of *rigour mortis* in all the four limbs. In the grounds of the Special Leave Petition also, the question in regard to the possibility of the deceased having been fired upon from a close distance has not been raised.

So far as the contention in regard to distance of firing is concerned, it is true, ordinarily, charring would take place, if firing is done from a distance of less than four feet, as has been noticed in some of judgments of this Court in *Subhash v State of Uttar Pradesh,* (1976) 3 SCC 629 : 1976 Cr LJ 1521 : AIR 1976 SC 1924; *Nath Singh v State of Uttar Pradesh,* (1980) 4 SCC 402; *State of Punjab v Wassan Singh,* (1981) 2 SCC 1 : AIR 1981 SC 697 : 1981 Cr LJ 410 and *Sidharth v State of Bihar,* (2005) 12 SCC 545 : AIR 2005 SC 4352 : 2005 Cr LJ 4499.

In some cases, medical evidence may corroborate the prosecution witnesses; in some it may not. The court, however, cannot apply any universal rule whether ocular evidence would be relied upon or the medical evidence, as the same will depend upon the facts and circumstances of each case. No hard and fast rule can be laid down therefor.

It is axiomatic, however, that when some discrepancies are found in the ocular evidence *vis-a-vis* medical evidence, the defence should seek for an explanation from the doctor. He should be confronted with the charge that he has committed a mistake. Instances are not unknown where the doctor has rectified the mistake committed by him while writing the post-mortem report.

In *Surinder Singh v State of Uttar Pradesh,* (2003) 10 SCC 26 : AIR 2003 SC 3811 : 2003 AIR SCW 4364, it was held:

> One of the pleas raised by learned counsel for the appellants was that the injuries as noticed by the doctor are at variance with the ocular evidence. On a close reading of the evidence of eye-witnesses and the doctor's report there is no noticeable variance. The mere fact that the doctor said that injuries appeared to be on one side of the body and the witnesses said that attacks were from different sides, is too trifle an aspect. When three persons are attacking a person, the witnesses naturally get shocked. This is normal human conduct and the immediate reaction is to save the victim and to stop the assailants from further attacks. That is precisely what has been done by the eye-witnesses. It is only when the medical evidence totally improbabilities the ocular evidence, that the Court starts suspecting the veracity of the evidence and not otherwise. *See* also *State of Karnataka v Papanaika,* (2004) 13 SCC 180 : AIR 2004 SC 4967 : 2004 Cr LJ 4667.

In *Anwar v State of Haryana,* (1997) 9 SCC 766 : 1997 All Cri R 529 : JT 1997 (3) SC 1, this Court observed:

> It is true that Dr. Jai Kishan (PW-9) who conducted the autopsy in his post-mortem examination report described Injury 1 as being incised wound 20 cms x 2 cms causing fracture of the underlying bone. He further noticed lacerated wounds on the neck of the right ear of the size 1 cm x one-second cm causing fracture of the underlying bone. While giving evidence in the court, he described an incised wound as Injury 1 and lacerated wounds as Injury 1-A. He further testified that it was a *bona fide* mistake in not describing these two injuries separately. Mr. Sushil Kumar urged that Dr. Jai Kishan (PW-9) has made a material improvement in his evidence before the court to suit the prosecution and to lend

> support to the evidence of eye-witnesses and, therefore, such an improved version which demolishes the evidence of eye-witnesses be not accepted. This submission, is an attractive one but having regard to the facts and circumstances of this case, it is not possible to accept the same. The consistent evidence of both these eye-witnesses was that A-2 had fired from his pistol on Baddal causing firearm injuries on his head and this evidence, in our opinion, is quite a credible one. Both these witnesses have referred to the firearm injury on Baddal on his head whereas lacerated wounds were found behind the right ear. In an assault of this nature, the exact description as regard to location of the firearm injury might be not accurate but that by itself would not render their evidence untrustworthy. It needs to be mentioned that the medical evidence is an opinion evidence which is used to lend corroboration to the evidence of eye-witnesses. If the medical evidence is found to be totally inconsistent with the ocular evidence on a given set of facts, it would be permissible for the court to reject the ocular evidence. As far as the facts of the present case are concerned as pointed out earlier, the inconsistency between the ocular evidence and the medical evidence is of a very minor nature and we do not think it proper to reject the evidence of these two eye-witnesses on that score. [Emphasis supplied]

Whereas in the body of the post-mortem report, the medical expert stated, 'the margin of wound charred and inverted' at another point, he in no uncertain terms stated that firing was done from long range and distance of firing would be from more than six feet. The possibility, therefore, of his commission of some mistake in the post-mortem report cannot be ruled out. It was on the said premise, it was incumbent upon the defence to bring the said fact to the notice of the doctor. Probably, knowing the futility of asking such a question, no such contention was raised either before the Sessions Judge or before the High Court. No such ground has also been taken before us.

Tattooing or charring shall depend upon the constituents of the propellant charge. It is in that context only wounds are classified by their external appearance as close contact, near contact and distant.

The doctor in his evidence was categorical in stating that the wounds would not come within the purview of classification of near contact; but the wounds should be classified under 'distant contact'.

The authorities like Taylor and HWV Cox in their treatises, state in details as to how the post-mortem examination should be conducted.

The nature of the gun will also have a role to play. Unfortunately, the investigating officer did not make any attempt even to seize the gun. When the weapon was not seized, the question of examination of any ballistic expert would not arise. [See *Nirmal Singh v State of Bihar,* (2005) 9 SCC 725 : 2004 AIR SCW 6717 : AIR 2005 SC 1265].

Section 45 of the Indian Evidence Act, 1872 reads as under:

> *45. Opinions of experts.*—When the Court has to form an opinion upon a point of foreign law or of science or art, or as identity of handwriting or finger impressions, the opinions upon that point of persons specially skilled in such foreign law, science or art, or in questions as to identity of handwriting or finger impressions are relevant facts. Such persons are called experts.

The opinion of an expert, therefore, is a relevant fact. The court may, thus, took the expert opinion into consideration. But appreciation of evidence is the court's job.

It is, thus, for the court to arrive at an opinion as to which part of contradictory expert opinion should be accepted or whether in a given situation ocular evidence should be believed in preference to medical evidence or *vice versa.*

In *State of Uttar Pradesh v Krishna Gopal,* (1988) 4 SCC 302 : AIR 1988 SC 2154 : JT 1988 (3) SC 544, this court has observed:

> It is trite that where the eye-witnesses account is found credible and trustworthy, medical opinion pointing to alternative possibilities is not accepted as conclusive. Witnesses, as Bentham said, are the eyes and ears of justice. Hence the importance and primacy of the orality of the trial process. Eye-witnesses account would require a careful independent assessment and evaluation for their credibility which should not be adversely prejudged making any other evidence, including medical evidence, as the sole touchstone for the test of such credibility. The evidence must be tested for its inherent consistency and the inherent probability of the story; consistency with the account of other witnesses held to be creditworthy; consistency with the undisputed facts; the credit of the witnesses; their performance in the witness box; their power of observation Then the probative value of such evidence becomes eligible to be put into the scales for a cumulative evaluation.

Yet again in *Dhirajbhai Gorakhbhai Nayak v State of Gujarat,* (2003) 9 SCC 322 : AIR 2003 SC 2855 : 2003 Cr LJ 3723, this Court held:

> As regards the alleged discrepancy between the medical evidence and ocular evidence, it is to be noted that a combined reading of the evidence of PW-9 who examined the deceased after he was brought to the hospital and PW-7 who conducted the post-mortem, it is clear that there is no discrepancy in the medical evidence *vis-a-vis* ocular evidence. Only in respect of Injury 1, there appears to be some confusion but that does not dilute the prosecution evidence. It would be erroneous to accord undue primacy to the hypothetical answers of medical witnesses to exclude the eye-witnesses account which has to be tested independently and not treated as variable keeping in view the medical evidence as constant. (See *State of Uttar Pradesh v Krishna Gopal*)

In *Birendra Rai v State of Bihar,* (2005) 9 SCC 719 : AIR 2005 SC 1284 : 2004 AIR SCW 6950, this Court observed:

> We do not attach much significance to the fact that some of the wounds showed an upward trajectory. A bullet may possibly be deflected if it hits a hard surface. The fact remains that all the shots fired have caused wound of entry as well as exit wound, and from the description of the wounds given by the doctor it appears that the firing was done from very close range. The evidence of the witnesses is to the same effect. They have clearly stated that they came near the deceased after firing took place. There was indiscriminate firing at the deceased who fell down after receiving the first injury. One cannot assume that the deceased was lying still in one posture after falling on the ground. He must have been writhing in pain when several shots were fired at him, and in that process several injuries were caused to him. So viewed, we find no inconsistency between the ocular evidence and medical evidence on record.

It was further observed:

> It was submitted that if several shots were fired, some pellets would have been found at the place of occurrence. It is the case of the prosecution that no pellets were found. For this reason alone we cannot discard the case of the prosecution. If pellets were found at the place of occurrence it would have further strengthened the case of the prosecution, but in the absence of such evidence one has to rely upon the ocular evidence which if found reliable, may be acted upon.

In *Nirmal Singh* (supra), it was held:

> Counsel then submitted that the prosecution has failed to prove that the dalan of the deceased was the real place of occurrence. This submission is based on the fact that no bloodstained earth was seized from the place of occurrence. It is true that no bloodstained earth was seized from the place of occurrence but there is also evidence of several witnesses including the investigating officer that no blood had fallen on the earth. Eye-witnesses explained that on receiving the injury the deceased pressed his wound with his hands whereafter a piece of cloth was tied around the wound which soaked the blood which may have come out. There was, therefore, no likelihood of the earth getting bloodstained. Counsel for the appellants submitted that the intestines were protruding as described in the

> inquest report, and in such a situation there must have been some bleeding. That may be so, but in view of the explanation offered by the prosecution witnesses it appears probable that no blood had fallen on the ground at the place of occurrence. In any event, if some blood had fallen at the place of occurrence which the investigating officer failed to notice, that by itself will not be fatal to the case of the prosecution. We must observe that the investigation in this case has been most unsatisfactory and the investigating officer was not conscious of his responsibilities. The bloodstained piece of cloth which was wrapped around the wound of the deceased appears to have been seized by the investigating officer, but when questioned as to why it was not sent for chemical examination, he answered that he had hung that piece of cloth on a guava tree in the police station. The statement is comical but discloses the utter non-seriousness with which the investigation was conducted. We had expected better from the investigating officer who was investigating a serious case of murder. However, for this reason we will not reject the case of the prosecution entirely. [Emphasis supplied]

We, therefore, are of the opinion that the second contention of the learned counsel also cannot be accepted.

We, however, are not oblivious of one patent fact. In the First Information Report, the first informant, attributed the act of firing to Brijnandan Prasad and Sahdeo. PW-4, however, in his deposition before the court attributed the act of firing only to Brijnandan Prasad. According to him, other persons were only wielding rifles. Shivnandan Prasad fell down after receiving the gunshot and died. He in his cross-examination also attributed the act of firing only to Brijnandan Prasad. PW-5 although stated that all the accused had started firing but even according to her Brijnandan Prasad fired shot which had hit the deceased on his chest. Evidence of PW-6 is also to the same effect that the shot which had hit his father on the chest was fired by Brijnandan Prasad. PW-7 and PW-8 also named Brijnandan Prasad.

The prosecution case is that the dispute started on lighting of fire on a heap of straw. The accused allegedly hurled brick bats, which compelled the deceased to come to the roof to forbid them from doing so. Whereas Brijnandan Prasad alone fired a shot which had hit the deceased, there is no evidence brought on record to show that any other accused did so. No gunshot injury was suffered by any person. The deceased has also suffered only one gunshot injury. No sign of firing was found on the walls or any other part of the building. No cartridge was recovered.

Even no other person had suffered any injury by reason of hurling of brick bats. Having regard to the materials brought on records, we are of the opinion that in this case although the prosecution has proved the charge of committing the murder of the deceased, it has failed to establish that the accused had any common intention in relation thereto. Brijnandan Prasad alone was, thus, responsible therefor. Had the other accused shared common intention with Brijnandan Prasad, they would have also fired. No such evidence having been brought on record, the benefit of doubt must be extended to the other accused persons.

8.20.10 Ballistics Evidence Desirable, not Indispensable[29]

Author's Summary

It is a case of unfortunate murder. The bullet from a licensed revolver injured the spinal cord of the victim (extracted at postmortem). In spite of medical care, the female died after about 5 months. The doctor gave Septicemia as the cause of death.

The SC held that the real cause of death was bullet injury and convicted the culprit. SC also mentioned that linkage of the bullet with the firearm was desirable but not indispensable in view of evidence of eyewitnesses

Highlights italicised

29. *Vineet Kumar Chauhan v State of Uttar Pradesh*, AIR 2008 SC 780 : 2008 AIR SCW 1 : 2008 Cr LJ 1367.

Relevant Extracts (Verbatim)

The genesis of the prosecution case, in brief, was that on 13 October 1993 at about 11.50 am, one Sri Krishna Sharma (PW-1), husband of the deceased, lodged an F.I.R. with the police station Majhola, District Moradabad to the effect that on that day, at about 9.45 am, when he along with his wife and children was watching television, the appellant who was living opposite their house and was a cable operator along with his servant Dharamveer, came to their house and tried to persuade his son-Ravindra Sharma (PW-2) to take a cable connection from them. Not being interested in the cable connection, they declined the request of the appellant whereupon an altercation took place between the appellant and PW-2. The complainant and his wife intervened and asked the appellant to leave their house. The appellant went to his house, brought out the licensed revolver of his father and opened indiscriminate firing towards complainant's house from the door of his house. Some bullets hit the door of the house of Sri Krishna Sharma and while his wife, the victim, was closing the door, one of the bullets hit her in the jaw. Sri Krishna Sharma brought his injured wife to the hospital for treatment and thereafter lodged the F.I.R.

3. The victim was examined by Dr. Jagmal Singh, PW-4. The following injuries were found on her person:

1. Lacerated wound 1.5 cm. x .5 cm x not probed on face, left side over left mandible, 3 cm. below and outer to left angle of mouth. Advised x-ray of left side fact and left side neck.
2. Lacerated wound .5 cm x .5 cm x skin on left arm outer part, 4 cm. above left elbow.

4. Both the injuries were found to be fresh. Injury No. 1 was alleged to have been caused by firearm but final opinion was reserved to be given after the x-ray. Injury No. 2 was caused by a blunt object. On x-ray being taken, a radio opaque shadow elongated was found in the thoracic spine in dorsal region over T 5-6.

5. The victim remained under treatment and supervision of Dr. D.S. Ahlawat (PW-5). On 15 October 1993, she was taken to Delhi for treatment. However, on 21 October 1993, she was again admitted in Moradabad Hospital, where she developed bedsores. Smt. Premwati ultimately died on 25 March 1994. As per the autopsy conducted by Dr. S.P. Singh (PW-7) on 25 March 1994, the ante-mortem injuries were mainly deep bedsores on various parts of the body and one old healed scar, size 1.2 cm x .5 cut, on the left face at the chin 2.5 cm. away from medium plank thoracic spine.

> *On internal examination, the doctor recovered a metallic bullet from her spinal cord, which had caused extensive damage in thoracic spine and paralysis in half of the body. The cause of death was opined to be septicemia and toxemia due to bedsores. After investigations, charge-sheet under sections 452 and 307 was filed against the appellant and his father. However, charges were framed against them under sections 302 and 307 IPC.*

8. Mr. Sushil Kumar, learned senior counsel appearing on behalf of the appellant assailed the conviction of the appellant mainly on the ground that apart from the fact that the Ballistic Report casts a serious doubt that the distorted bullet allegedly recovered from the spot came out of the seized revolver, it was also obligatory on the part of the prosecution to send the bullet, allegedly recovered from the body of the deceased, for being examined by the Ballistic Expert, so as to connect the recovered licensed revolver of the appellants father with the crime. It was submitted that since it was a positive case of the prosecution that the bullet which had hit the deceased was fired from the seized revolver, omission to send the bullet for ballistic examination is a serious infirmity in the prosecution case, which assumes still greater significance because of Ballistic Report, which does not even establish that the remnants of the bullet (lead), recovered from the place of incident, was of the bullet fired from the revolver allegedly used by the

appellant. In support, strong reliance is placed on the decision of this Court in *Mohinder Singh v State of Punjab,* AIR 1953 SC 415 : 1953 Cr LJ 1761 (SC) wherein it was observed that in a case where death is due to injuries or wounds caused by a lethal weapon, it has always been considered to be the duty of the prosecution to prove by expert evidence that it was likely or at least possible for the injuries to have been caused with the weapon with which and in the manner in which they are alleged to have been caused. Reference is also made to another decision of this Court in *State of Madhya Pradesh v Surpa*,[30] expressing a similar view. Learned counsel has also contended that all through the case of the prosecution was that the accused was firing towards the house of the deceased without aiming at any person and the bullet hit the deceased accidentally when she was closing the door of the house. It is urged that in case the appellant had any intention to commit the murder of the deceased or any member of her family, he would have gone to their house and shot them. It is argued that even if the occurrence is admitted to have taken place in the manner alleged, the appellant cannot be held guilty for the commission of an offence punishable under section 302 IPC. It is asserted that the occurrence having taken place without pre-meditation, in the heat of the passion upon a sudden quarrel, the appellant is entitled to the benefit of Exception 4 of section 300 IPC.

9. Learned counsel for the State, on the other hand, supported the view taken by the High Court.

10. *It cannot be laid down as a general proposition that in every case where a firearm is allegedly used by an accused person, the prosecution must lead the evidence of a Ballistic Expert to prove the charge, irrespective of the quality of the direct evidence available on record. It needs little emphasis that where direct evidence is of such an unimpeachable character, and the nature of injuries, disclosed by post-mortem notes is consistent with the direct evidence, the examination of Ballistic Expert may not be regarded as essential. However, where direct evidence is not available or that there is some doubt as to whether the injuries could or could not have been caused by a particular weapon, examination of an expert would be desirable to cure an apparent inconsistency or for the purpose of corroboration of oral evidence.* (See: *Gurcharan Singh v State of Punjab*).

11. In *Mohinder Singh's* case (*supra*) on which strong reliance is placed on behalf of the appellant, this Court has held that, where the prosecution case was that the accused shot the deceased with a gun, but it appeared likely that the injuries on the deceased were inflicted by a rifle and there was no evidence of a duly qualified expert to prove that the injuries were caused by a gun, and the nature of the injuries was also such that the shots must have been fired by more than one person and not by one person only, and the prosecution had no evidence to show that another person also shot, and the oral evidence was of witnesses who were not disinterested, the failure to examine an expert would be a serious infirmity in the prosecution case. It is plain that these observations were made in a case where the prosecution evidence was suffering from serious infirmities. Thus, in determining the effect of these observations, the facts in respect of which these observations came to be made cannot be lost sight of. The said case, therefore, cannot be held to lay down an inflexible rule that in every case where an accused person is charged with murder caused by a lethal weapon, the prosecution case can succeed in proving the charge only if Ballistic Expert is examined. In what cases, the examination of a Ballistic Expert is essential for the proof of the prosecution case, must depend upon the facts and circumstances of each case.

12. ***In the instant case, having regard to the ocular evidence adduced by the prosecution, there is no reason to discard the prosecution theory that the injury as a result whereof Smt. Premwati suffered complete paralysis of both the lower limbs, was caused by a bullet fired from a revolver. The nature of the injury as proved by Dr. P.S. Ahlawat (PW-5), under***

30. *Vineet Kumar Chauhan v State of Uttar Pradesh*, AIR 2008 SC 780 : 2008 Cr LJ 1367 (SC).

whose treatment the deceased remained at Moradabad and Dr. S.P. Singh (PW-7), who had conducted the post-mortem examination is wholly consistent with the prosecution version. It is clear that the bullet recovered by PW-7 at the time of post-mortem of the victim had traversed to thoracic spine through the neck from the face near the angle of the jaw, hitting the fifth thoracic vertebra, badly damaging the underlying spinal cord. We are, therefore, of the view that on the facts of the present case, the absence of Ballistic Experts evidence is not fatal to the case of the prosecution, notwithstanding the fact that the Forensic Science Laboratory, in its report dated 18 February 1991, had not expressed a definite opinion about the bullet recovered from the place of occurrence.

13. Insofar as the testimonies of PW-1 and PW-2, the two star witnesses of the prosecution, are concerned, from the impugned judgment, it is manifest that the High Court, on analysis of their statements, has found these to be trustworthy. The High Court has observed that testimony of these two natural witnesses is of sterling character with no holes whatsoever. Based on this evidence, the High Court has found that it was the appellant who had opened fire from the revolver from his door, one of which had hit the victim, who had come to close the main door of her house. Nothing has been shown to us so as to warrant interference with the said finding recorded by the High Court. Therefore, in the context of this unimpeachable evidence, it stands proved that the appellant had gone to the house of the deceased; some unsavoury incident took place there; he returned to his house in a huff; took out the revolver of his father and fired shots towards the house of the deceased; one of the bullets hit the deceased and the same proved to be fatal. Having bestowed our anxious consideration to the evidence on record, in particular the testimony of PW-1 and PW-2, we are of the opinion that the High Court was correct in coming to the conclusion that the appellant was responsible for causing the fatal injury to the deceased. We are also in agreement with the High Court that though as per the post-mortem report the deceased died of septicemia and toxemia because of bedsores, the basic cause of her death was the bullet injury caused to her by the appellant.

8.20.11 Nature of Firearm from Injuries[31]

Author's Summary

It is a case of multi-murders. A party travelling in a car was ambushed. 3 persons died on the spot and others were injured. The culprits ran away after the firing. The question came up what type of weapon(s) were used by the culprits. The SC has used authorities to identify the firearms from injuries.

Relevant Extracts (Verbatim)

3. On 4 April 1999 Rakesh Kumar Pandey along with his brother-in-law Surya Narain @ Vakil Shukla along with three others, Devi Shankar Dubey, Prem Shanker Dubey and the car driver Shesh Mani were returning from Aurai to Gopiganj in the latter car No. WB 26A 7554. As the car reached near the Trimuhani on the middle of the road in Gopiganj, accused Udai Bhan Singh, Akbal Bahadur @ Atkoti Singh, Prem Singh, Dhunni Singh, Munni Singh, Daroga Singh, Rajeshwar Upadhyay, Pintoo Singh and two other persons all armed with modern weapons starting firing at the car. The firing led to the death of Surya Narain @ Vakil Shukla, Devi Shanker Dubey and Shesh Mani at the spot. Rakesh Kumar Pandey and

31. *Sarvesh Narain Shukla v Daroga Singh*, AIR 2008 SC 320 : 2007 AIR SCW 6843 : 2008 (1) ALJ 56.

Prem Shanker who were sitting on the rear seat rushed out of the car to save themselves and they too received some superficial injuries in that process. The assailants also picked up the licensed rifle of Prem Shanker Dubey which was lying in the car and thereafter ran away from the Spot. The occurrence was also witnessed by Shiv Prasad @ Dangar Tewari, Mukand Lal, Ram Dutt Mishra and several other persons. An FIR was thereafter lodged by Rakesh Kumar Pandey at 3.45 pm in Police Station Gopiganj a kilometre away from the place of incident on which S.I. Vidya Prakash Misra reached the place of occurrence and recorded the statement of Rakesh Kumar Pandey whereas S.I. Rashid Ahmad prepared the inquest reports of the deceased on the dictation of S.I. Vidya Prakash Misra. On inspection of the site, several pieces of glass, a blood stained piece of rexine, and shoes and some fired cartridges, a rifle and a 9 mm pistol licensed to deceased Surya Narain Shukla were recovered. The bodies were also sent for the post-mortem examinations. The post-mortem examination on the dead body of Devi Shanker Dubey was conducted by Dr. Radhey Raman on 4 April 1999 at about 11.55 pm whereas Dr. Sanjay Tewari conducted the post-mortem examinations on the dead bodies of Shesh Mani at 11.30 pm and that on Surya Narain Shukla 45 minutes later *i.e.,* at 0030 hours. All three dead bodies showed extensive firearms injuries. Dr. A.K. Pandey also medically examined Prem Shanker Dubey at 5.25 pm on 4 April 1999 and found two lacerated simple injuries on his person whereas the examination of Rakesh Kumar Pandey at 8.15 pm on 4 April 1999 by Dr. L.S. Mishra showed five simple injuries; three abrasions and two contusions. The doctors opined that these injuries could have been caused as the two were making a hurried exit from the car. On the completion of the investigation the accused were charged for offences punishable under sections 147, 148, 302 read with 149 I.P.C whereas appellant Suresh Singh @ Jajjey Singh was in addition charged under section 379, IPC for having taking away Prem Shankar Dubey\022s rifle from the car whereas Tehsildar Singh and Suresh Singh were further charged under section 411, I.P.C. The accused pleaded not guilty and sought trial.

* * *

13. Mr. Sushil Kumar has also laid great stress on what he perceives to be an apparent discordance between the ocular and the medical evidence. He has emphasized that the Investigating Officer had picked up three spent cases of a 12 bore shotgun from the spot and a wad had also been recovered from one of the dead bodies at the time of the post-mortem examination thus indicating that only shotguns and no pistols or carbines as alleged had been used, which clearly falsified the eye-witnesses. He has in this connection cited the judgment in *Awadesh v State of Madhya Pradesh,* (1988) 3 SCR 513 : (1988) 2 SCC 557 : AIR 1988 SC 1158 to submit that where medical opinion was at variance with the ocular account the accused were entitled to the resultant benefit.

Undoubtedly, the medical evidence is extremely relevant in testing the credibility of an eye-witness but we are of the opinion that the eye-witness account is fully in consonance with the statements of the doctors and the other medical evidence. It has come in the statement of the eye-witnesses including Prem Shankar Dubey and also of Dr. Sanjay Tewari PW-8 on specific questions put to them that the shots had been fired from a distance of a foot or two. We now reproduce the post-mortem reports prepared by PW Dr. Sanjay Tewari with respect to Vakil Shukla and Shesh Mani Rai:

Vakil Shukla

1. Lacerated wound 2x1 Cm. on the mid forehead with charring and tattooing around it. Frontal bone not injured.
2. Abrasion 1x 0.5 Cm. on the mid forehead with charring and tattooing around it.

3. Wound of firearm entry 6 in number each measuring 0.8 x 0.8 Cm. on the top and back of the left shoulder. Margins of wound inverted with blackening and tattooing all around it with their wound of exit as follows—
   (1) 1.5 x 1.5 Cm. on the left side chest below the left axilla 5 Cm. below the apex;
   (2) 3 x 3 Cm. on the left side chest 8 Cm. below and lateral to the left nipple;
   (3) 1 x 1 Cm. on the right side chest 6 Cm. below the right nipple.
   (4) 1x1 Cm. on the right side chest 4.5 Cm. above and medial to the right nipple;
   (5) 1x1 Cm. on the right side chest 8 Cm. below the right nipple; and
   (6) 1x1 Cm. on the right side chest 6.5 Cm. lateral to the right nipple.
4. Firearm wound of entry 0.8x0.8 Cm. on the lateral surface of right mid-thigh with inverted margins and tattooing all around it with its wound of exit on the medial surface of thigh at the same level with averted margins 1x1 Cm.

Shesh Mani Rai

1. 5 x 4 Cm. on the right side neck 1 cm. below and posterior to the right ear. Margins of the wound were inverted with charring and tattooing of skin all around with its wound of exit of size 6x5 Cm. on the left side face/over and lateral to the left eye-with averted margins;
2. Wound of entrance 5.5x4 Cm. on the right side eye margin of the wound inverted with charring and tattooing of skin all around, with its wound of exit 6x6 Cm. below the left ear. Margin of the wound averted.
3. Wound of entrance 1x1 Cm. on the lateral aspect of left arm. Margins of wound inverted with charring and tattooing of skin all around with its wound of exit 1.5x1.5 Cm. on the posterior lateral aspect of the left arm. Margins of wound Averted [\024].

14. Dr. Radhey Raman PW-3 recorded the following injuries on the dead body of Devi Shankar Dubey:

1. Firearm wound of entry with charring and tattooing of size 2x1 Cm. Lt. Side of the chest just below the middle part of Lt. Clavicle. Lt. Side Clavicle fractured with same wound of exit.
2. Firearm wound of entry with charring and tattooing of six 1x1 Cm. on rt. Supra clavicle region 4 Cm. Medial to top of rt. Shoulder, margins of wound inverted, with its wound of exit 2.5x2.00 Cm. on the lt. Side of chest on its lateral side 5.00 Cm. lateral and just below it. Nipple margin of wound of exist is averted; and
3. Abraded contusion 2x2 Cm. on rt. Side of the forehead[\024.] [A cork (1.5 x 1.2 cm) was also recovered from the dead body.

15. Relying on the above quoted evidence it has been emphasized that there appeared to be no injuries from a rifle or pistol. We however beg to differ. It bears reiteration that shots had been fired from a distance of a feet or two and this opinion is fortified as the entry wounds without exception show signs of charring and tattooing. The dimensions of the entry wounds also show that several different types of weapons have been used. It is clear from the post-mortem examination of Devi Shankar Dubey\022s body (during which a cork had been recovered) that a shotgun had undoubtedly been used in his murder and that the shot had entered *en masse* as is apparent from the size of wound of entry (Injury No. 1).

16. We now come to the reports of the other two deceased. Injury No. 3 on the person of Vakil Shukla is clearly not an injury caused by a shotgun and has been caused by a medium calibre automatic or semi-automatic rifle or pistol. Mr. Sushil Kumar has however submitted that this injury had possibly been caused by a shotgun using buckshot SG/LG cartridges as had a high velocity rifle been used from a close range as suggested, the bullet would have had a blasting effect on the body. We, however, find that this argument is not substantiated on the evidence, that is, available to us. Undoubtedly, this shot too had been fired from a little beyond point blank range and if it had been fired from a shotgun, the shoulder would have been shattered and in any event the entire charge would have entered the body *en masse* making a rat hole wound of entry.

We are fortified in our view by the observations on p 465 of the Fourth Edition of Dr. B.R. Sharma Forensic Science in Criminal Investigation and Trials: 9.10.7.3 Shotgun injuries:

The nature of the injuries caused by the shotgun is greatly altered by the range. Contact or near contact wounds look like explosions. Close range shots up to about three metres give rat holes varying in diameter from about 2 to 6 centimetres. From about 2 metres to 10 metres the projectiles may form a rat hole surrounded by individual pellet holes. Beyond 10 metres most of the shots form separate holes. The buckshots may separate earlier. For example, an L.G. cartridge may give individual injuries for each shot from a range of about 2 metres. The area covered by the pellets vary with the range and the choke characteristics of a gun. Ordinarily, the shotguns projectiles do not form exit holes except when buckshots are used from close ranges.

* * *

17. Modi *Medical Jurisprudence and Toxicology,* Twenty-third Edition at p 722 is to the same effect. We reproduce the relevant passage hereunder:

> *The effects produced by a small shot fired from a shotgun vary according to the distance of the weapon from the body, and choking device. A charge of small shot, fired very close to, or within a few inches, of the body enters in one mass like a single bullet making a large irregular wound with scorched and contused edges, and is followed by the gases of the discharge which greatly lacerate and rupture the deeper tissues. Particles of unburnt powder expelled from the weapon behind the missile are driven to some distance through the wound, and some of them are found embedded in the wound and the surrounding skin, which is also singed and blackened by the flame and smoke of combustion. The exit wound of a close range shot may show greater damage of tissues than the entrance wound, the margins are everted, but there is no evidence of blackening of singeing. At a distance of one to three feet, small shots make a single aperture with irregular and lacerated edges corresponding in size to the bore of the muzzle of the gun, as the shot enter as one mass, but are scattered after entering the wound and cause great damage to the internal tissues. The skin surrounding the wounds is blackened, scorched and tattooed, with unburnt grains of powder. On the other hand, at a distance of six feet, the central aperture is surrounded by separate openings in an area of about two inches in diameter made by a few pellets of the shot, which spread out before reaching the mark. The skin surrounding the aperture may not be blackened or scorched, but is tattooed to some extent. At a distance of 12 feet, the charge of the shot spreads widely and enters the body as individual pellets producing separate openings in an area of five to eight inches in diameter depending on the choke, but without causing blackening, scorching or tattooing of the surrounding skin.*

21. Mr. Sushil Kumar argument with regard to the use of a high velocity rifle and its effect on the body when fired from a close range would undoubtedly merit serious consideration but in the light of the facts on the record, we are unable to concur. It is the case of the prosecution that carbines and 9mm pistols in addition to shotguns had been used during the attack. A carbine,

a high velocity weapon firing automatically or semi-automatically, and 9mm bore pistols are prohibited firearms permitted for use only by the police and armed forces which invariably use hard-nosed bullets in contradistinction to soft nosed ones used in sporting rifles against soft skinned game and which cause immense internal damage on the victim and huge wounds of exit, if any. We find that all six wounds of entry are of 0.8x0.8 cm. and with the exception of one, all exit wounds are also of almost similar dimensions. We are, therefore, of the opinion that injury No. 3 appears to be a wound of entry from a weapon firing hardnosed bullets which had penetrated the body and exited on the other side. We find support for this view from Modi (Supra) (at pp 717-718): [\023] Because of the obvious difference in design and construction, the wounds produced by hunting ammunition are much more devastating than that of the military ammunition. In military ammunition, the bullets are full metal jacketed having a core of steel or lead inside and are thus prevented from deformation (or expansion) when they hit the target. In contrast, a hunting bullet is designed to deform (or expand) in its passage through the body, producing an increase in its presenting area. Thus a hunting bullet, which is partially metal jacketed, but with the lead core exposed at its tip, is referred to as soft-point bullet. Hollow point hunting-bullets are also partially jacketed but have a cavity at the tip of lead core to facilitate expansion on striking the target. The silvertip hunting-bullet in reality is a soft point bullet whose lead core at its tip is protected by a thin jacket of aluminium alloy sheath. Modern steel-jacketed bullets used in army weapons have the shape of an elongated cone and owing to their great velocity usually pass straight and direct through the body without any deflection or deviation, and without causing much damage. The wounds of entry and exit are almost circular and similar in appearance without any bruising or laceration of the surrounding parts\024.

21. The nature of injuries found on the dead body of Shesh Mani Rai are equally significant. It appears from injury Nos. 1 and 2 which are on the neck and head respectively that the shot had furrowed through the body with a huge exit wound. The very dimension of these injuries show the presence of a rat hole type of entry with a larger wound of exit on the other side. Injury No. 3 substantially corresponds with the injuries found on the dead body of Vakil Shukla and reveals that this injury had not been caused with the weapon which caused the other two injuries. The judgment cited by the learned counsel is therefore on its peculiar facts and based on the premise that the evidence in the case was doubtful.

* * *

20. We have also considered the arguments of learned senior counsel on the appeals against acquittal. We are of the opinion that the matter has been considered by the trial court and the High Court in its correct perspective and no interference is called for.

21. We accordingly dismiss all the appeals.

8.20.12 Pellets not Found in Shotgun Fire[32]

Author's Summary

It is a case of murder in a family dispute, a 12 bore shotgun was used. The main point to determine was whether the injured 2 eyewitnesses were really injured or not . The absence of pellets in their injuries nailed the lie. The SC believed that the firing/killing was in self-defence. The SC also laid guideline to identify a self-defence case.

Highlights italicised

32. *Darshan Singh v State of Punjab*, AIR 2010 SC 1212 : 2010 AIR SCW 832 : 2010 Cr LJ 1393.

Relevant Extracts (Verbatim)

Brief facts which are necessary to dispose of this appeal are recapitulated as under:—

The dispute is between very close and intimate family members. Deceased Gurcharan Singh was the brother of Bakhtawar Singh and uncle of Darshan Singh. He was the father of Gurdish Singh, PW-7, the informant. The agriculture fields of both brothers, Gurcharan Singh and Bakhtawar Singh were situated adjoining to each other. According to the prosecution, on 15 July 1991 at about 8 am. Gurdish Singh, PW-7 and his father, Gurcharan Singh were irrigating their aforesaid fields and were also mending its ridges and at that time Gurdev Singh, PW-8 and Ajit Singh were also present there. In the meantime, Darshan Singh and Bakhtawar Singh came there from the side of their fields raising lalkaras and abused the complainant party. Darshan Singh, accused was armed with D.B.B.L. gun and his father Bakhtawar Singh was carrying a Gandasa and they were saying that they would teach a lesson to the complainant party for cutting the ridges.

5. According to the further story of the prosecution, Bakhtawar Singh gave a Gandasa blow causing injuries on the chest of Gurcharan Singh. Gurcharan Singh was also having a Gandasa with him and in order to save himself he also caused injury on the head of Bakhtawar Singh. Thereafter, Darshan Singh fired two shots from his licensed gun which hit Gurcharan Singh in the chest and some of the pellets hit Gurdish Singh PW-7 on his left upper arm and Gurdev Singh, PW-8 on his left thigh. Gurcharan Singh fell down and died at the spot. Gurdish Singh and others retraced their steps in order to save themselves. Both the accused in order to save themselves ran towards their respective houses. The prosecution examined 11 witnesses. Dr. Mukesh Gupta, PW-4 who conducted the post-mortem examination found the following injuries on the dead body of Gurcharan Singh:—

> 1. There were 14 wounds in an area of 20 cm x 18 cm on the left side of the chest above the nipple. One of the wounds which was above the nipple was having inverted margins. A wad was recovered from this wound. This wound was 1 cm x 1 cm. The 9 wounds which measured 0.75 cm x 0.75 cm which were on the chest and shoulder also had inverted margins. Out of these wounds 6 were found to entering chest cavity and 6 pellets were recovered from the chest cavity. The remaining 3 wounds were having everted margins. These were near the axilla and each wound measured 1 cm x 1 cm. One of the 14 wounds which measured 0.75 cm x 1.5 cm was having inverted margins. It was skin deep and was on the shoulder, upper part of humerus and clavicle bones were found to be fractured. 4th and 5th rib of the left side of the chest were also found to be fractured.
>
> 2. There were 7 wounds in an area of 20 cm x 8 cm on the upper part of the chest on its right side above the nipple. Out of these wounds 3 wounds measuring 0.75 cm x 1 cm each was having inverted margins, these were skin deep. 2 wounds were having everted margins having a dimension of 1 x 1 cm each near the axilla. A pellet was recovered from near the axilla. The remaining 2 wounds were near the top of right shoulder measuring 0.75 x 1.5 cm each with inverted margins. These were skin deep.
>
> 3. An incised wound 8 cm x 0.5 cm skin deep on the left side of chest 3 cm above the nipple. It was horizontally placed.

10. Dr. Mukesh Gupta found following injury on the person of Gurdev Singh:—

> *An abrasion measuring 1 cm x 0.5 cm on the front and inner side of left thigh. It was a superficial abrasion reddish in colour, over the junction of upper l/3rd and lower 2/3rd of the thigh. There was damage to the pajama corresponding to the injury."*
>
> ***11.*** *According to the doctor, the injury was simple in nature and was caused within 24 hours.*
>
> *Doctor also found injury on Gurdish Singh to be superficial. The same reads as under:—*

"A very superficial abrasion 1 cm x 0.5 cm on the upper side of left upper arm 12 cm above the elbow. It was reddish in colour.

12. It may be relevant to mention that Dr. M.S. Gill, PW-5, who conducted the medical examination of Bakhtawar Singh found the following injuries on his person:—

1. An incised wound 7 cm x 0.5 cm on the parietal region of the right side of head. It was placed anterior posteriorly. The wound was bone deep and 4 cm above the right pinna, clotted blood was present.

13. According to doctor, this injury was caused by sharp-edged weapon.

* * *

21. The trial court after discussing the entire evidence came to the conclusion that two counter versions of the case have been presented and, in the view of the trial court, the defence version is more probable and nearer to the truth for the following reasons:

(i) The delay in lodging the FIR impels the court to scrutinize the evidence of witnesses regarding the actual occurrence with greater care and caution.

(ii) The crucial point to be decided in this case was that who was the aggressor or which of the parties can have the motive to open the attack?

The trial court held that "if the accused were already cultivating the land as per compromise, then it does not appeal to reason as to why they would feel aggrieved. On the other hand there was a strong motive for Gurcharan Singh to assault the accused person as he has resiled from the compromise."

(iii) The next crucial point according to the trial court was as to where the incident took place? According to the trial court the incident had taken place in the field of the accused.

(iv) According to the trial court, the presence of the prosecution witnesses Gurdev Singh and Gurdish Singh at the time of alleged occurrence is highly doubtful. Dr. Mukesh Gupta stated that the injuries on Gurdev Singh and Gurdish Singh could be caused by friendly hands and can be self-suffered.

(v) No pellet was recovered from the injuries of the prosecution witnesses namely, Gurdev Singh and Gurdish Singh. The possibility of the injuries on their persons having been fabricated at a later stage cannot be ruled out.

The trial court found that, in the instant case, it appeared that the inquest report was prepared first and the FIR was prepared at some later stage because there was no mention about the injuries of Gurdev Singh and Gurdish Singh in the inquest report, whereas this fact is mentioned in the FIR. According to the prosecution case, Gurdish Singh suffered a pellet injury on his left upper arm whereas, Gurdev Singh was hit on his left thigh. This was so mentioned in the FIR. If it was so, this fact would have been mentioned in the inquest report or the Investigating Officer must have prepared their injury statement, but no such injury statement was prepared at the spot nor their medical examination was got done.

In the cross-examination, Om Prakash ASI had admitted that he came to know about the injuries of Gurdish Singh and Gurdev Singh only when they gave their supplementary statements at the bus stand. The finding of the trial court is that the injuries were fabricated with the connivance of the Investigating Officer just in order to make Gurdish Singh and Gurdev Singh stamp witnesses.

(vi) Gurdish Singh PW-7 had admitted that his father Gurcharan Singh was face to face when Bakhtawar Singh gave Gandasa blow from above to downward vertically on the chest of Gurcharan Singh. However, Dr. Mukesh Gupta contradicted him and stated

that injury No. 3 on the person of Gurcharan Singh was skin deep and was horizontally placed and was possible by a fall on a sharp edged weapon.

From this it can safely be concluded that it was not Bakhtawar Singh who gave Gandasa blow to Gurcharan Singh in the manner as suggested by the prosecution. It is most likely that Gurcharan Singh suffered injury No. 3 by a fall on his own Gandasa and this was the reason that the wound was only skin deep.

The story put forth by the prosecution that Gurcharan Singh was cutting weeds of ridges with Gandasa is not believable. Gurdish Singh stated that he was collecting the cut weeds. They were not having any Kassi or Khurpa and it was not possible to cut weeds of ridges with Gandasa.

(vii) The trial court came to a clear conclusion that Bakhtawar Singh was injured at point 'F' as shown in the site plan at the hands of Gurcharan Singh (deceased). Gurcharan Singh after causing that injury forwarded towards Darshan Singh armed with Gandasa and at that point Darshan Singh had no option but to open fire and Gurcharan Singh died of that firearm injury. The trial court came to the definite conclusion that Darshan Singh fired a shot in his right of private defence.

(viii) The trial court after marshalling the entire evidence came to the conclusion that seeing from all angles, the probabilities of the case are much more in favour of the defence than in favour of the prosecution.

The possibility of the injuries having been caused to Gurcharan Singh by Darshan Singh in the exercise of private defence cannot be ruled out. Thus, the prosecution has failed to prove its case against the accused person beyond any reasonable doubt and the benefit has to be given to them.

58. The following principles (for self-defence) emerge on scrutiny of the judgments[33]:

(i) Self-preservation is the basic human instinct and is duly recognized by the criminal jurisprudence of all civilized countries. All free, democratic and civilized countries recognize the right of private defence within certain reasonable limits.

(ii) The right of private defence is available only to one who is suddenly confronted with the necessity of averting an impending danger and not of self-creation.

(iii) A mere reasonable apprehension is enough to put the right of self-defence into operation. In other words, it is not necessary that there should be an actual commission of the offence in order to give rise to the right of private defence. It is enough if the accused apprehended that such an offence is contemplated and it is likely to be committed if the right of private defence is not exercised.

(iv) The right of private defence commences as soon as a reasonable apprehension arises and it is co-terminus with the duration of such apprehension.

(v) It is unrealistic to expect a person under assault to modulate his defence step by step with any arithmetical exactitude.

33. *See* also *Triloki Nath v State of Uttar Pradesh*, AIR 2006 SC 321 : 2005 AIR SCW 5824 : (2005) 13 SCC 323; *State of Madhya Pradesh v Ramesh*, AIR 2005 SC 1186 : 2004 AIR SCW 6663 : (2005) 9 SCC 705; *James Martin v State of Kerala*, (2004) 2 SCC 203; *Kashmiri Lal v State of Punjab*, AIR 1997 SC 393 : 1996 AIR SCW 3772 : (1996) 10 SCC 471; *Bhagwan Swaroop v State of Madhya Pradesh*, AIR 1992 SC 675 : (1992) 2 SCC 406 : 1992 AIR SCW 362; *Jagtar Singh v State of Punjab*, AIR 1993 SC 970 : 1993 AIR SCW 70 : 1993 Cr LJ 306. Many other cases have also been cited in the present Judgment.

(vi) In private defence the force used by the accused ought not to be wholly is proportionate or much greater than necessary for protection of the person or property.

(vii) It is well-settled that even if the accused does not plead self-defence, it is open to considering such a plea if the same arises from the material on record.

(viii) The accused need not prove the existence of the right of private defence beyond reasonable doubt.

(ix) The Indian Penal Code confers the right of private defence only when that unlawful or wrongful act is an offence.

(x) A person who is in imminent and reasonable danger of losing his life or limb may in exercise of self-defence inflict any harm even extending to death on his assailant either when the assault is attempted or directly threatened.

In the instant case after marshalling and scrutinizing the entire prosecution evidence, we are clearly of the view that the trial court's view is not only the possible or plausible view but it is based on the correct analysis and evaluation of the entire evidence on record. Rationally speaking, no other view is legally possible.

65. Consequently, this appeal is allowed and the impugned judgment of the High Court is set aside and the judgment of acquittal of the trial court is restored. The role attributed to the appellant is fully covered by his right of private defence.

8.20.13 Self-inflicted (fake) Injuries (from Range of Fire)[34]

Author's Summary

The culprit in this case owed Rs 5 lakhs to the victim and would not pay. Instead he took the victim in a car to a lonely place and shot him dead.

To save himself he filed an FIR that he was shot. He had two firearm injuries, one on the arm and the second on the calf. Both had close range fire phenomenon (blacking)

There was an eyewitness who stated that he saw the culprit shooting the victim and creating fake injuries. All the courts accepted the version of the eyewitness, identified the injuries on the accused as fake and convicted him for murder.

Highlights italicised

Relevant Extracts (Verbatim)

3. The case of the prosecution in a nutshell before the trial court was as under: Sandeep Singh (who has been referred to hereinafter as "the deceased") was a resident of Village Chhibian Wali. He had lent a sum of Rs 5 lakhs to Gurjinder Singh, the appellant and the said amount was not being returned by Gurjinder Singh (hereinafter referred to as "the accused"). On the night of 9 June 2001, the deceased and the accused, along with Jasbir Singh (PW-4) were going to Village Chhibian Wali in Maruti Car No. PB 4 E 6699 from Muktsar. The deceased was driving the car and the accused was sitting next to him, whereas PW-4 was sitting on the rear seat. Around 10.30 pm, when they were about one kilometre away from Canal Bridge, Ladhuwala, the accused asked the deceased to stop the car as he wanted to ease himself.

34. *Gurjinder Singh v State of Punjab*, (2011) 3 SCC 530.

4. ***When the car stopped, the accused stepped out of the car and went to the back side of the car and thereafter came near the driver's seat with his pistol and fired one shot on the right temple of the deceased and another shot on the neck of the deceased. Upon seeing the said firing, PW-4, raised an alarm and thereupon the accused warned him that he would kill him also if he would not keep quiet and, thereafter, the accused fired on his own left arm and another shot below his own knee of the right leg.***

5. PW-4 was afraid of the incident and thereafter he ran away from the place. He, thereafter, telephoned his sister and his sister's husband but was advised to keep mum to save himself. Thereafter, his sister and her husband, who were aboard came to India and cremated the deceased. Thereafter, PW-4 went to police station along with his sister and her husband and narrated the incident to SHO Harbans Singh (PW-13). An AIR was lodged by him on 1 July 2001 at 5 am whereas the incident had taken place on 9 June 2001.

6. *It may incidentally be noted that before the aforesaid FIR was lodged, the accused had lodged an FIR being FIR No. 118 on 10 June 2001 at Police Station Sadar, Jalalabad.*

8. After the aforesaid FIR was filed, Harbans Singh (PW-13). The SHO went to the place of offence and prepared inquest report, Ext. p 2 and took possession of three empty cartridges and bloodstained handkerchiefs, bloodstained glasses and one empty cartridge below the driver's seat and one bullet of .32 bore weapon. He also recorded statement of PW-4 on 1 July 2001.

9. As per the report of the forensic science laboratory (FSL) Ext. P-51, the cartridges which had been received from the spot of the offence were fired from 7.65 mm pistol and the blood which was found from the pieces of glass was human blood of Group B.

11. Post-mortem of the body of the deceased was conducted by Dr. Rajesh Kumar Sharma (PW-1) on 10 June 2001, and it was found that there was a lacerated punctured wound on the right temporal region and there was a lacerated punctured wound on the right side of the middle of the neck. There was a dark black area around both the wounds. A lacerated un-punctured wound on the left side of his neck and behind the left ear lobe was also found. The fourth injury on the deceased was on the back of the neck at the level of C 6 vertebra and 3 cm away from the middle of the left side of the neck. The cause of death was shock and haemorrhage due to injuries to brain and neck. The injuries were sufficient to cause death in the ordinary course of nature.

12. At the time of trial, the accused denied the allegations levelled against him. It was his case that PW-4 had planned the murder and he had conspired with Harcharan Singh, with whom the accused had animosity. After examining the witnesses and upon perusal of the evidence, the trial court passed on order of conviction dated 3 March 2006.

13. Being aggrieved by the order of conviction, the foretasted appeal was filed before the High Court by the accused which has been dismissed and, thereafter the present appeal has been filed.

24. Possibly PW-4 was afraid as he was threatened by the appellant as stated by him and also because he had seen the offence being committed before him and for that reason he did not dare to go to the police station immediately but he talked to the parents of the deceased on telephone. It has come in evidence that the parents of the deceased asked him to await till their arrival and thereafter he gathered courage to file an FIR only after having discussion with them the parents of the deceased came to his place and gave him necessary courage and strength to tell the truth before the police authorities. Though there was delay in filing of the FIR, the contents of the FIR are not incorrect.

25. *The story put forward by the accused in his FIR does not appear to be correct. On the contrary, we find truth in the FIR filed by PW-4, because the injuries inflicted upon the accused prima facie appear to be self-inflicted. Looking at the nature of bullet injuries suffered by the accused, it is very*

clear that he was shot from a very close range. The said fact can be revealed from the presence of burn injuries, black area around the wound of the bullet. Had it been fired from a distance, the presence of burn injuries or dark marks around the wound would not have been there.

26. *When a weapon is fired from a close range, normally gunpowder which come along with the bullet make dark burn marks around the wound. Both wounds on the accused are having such black marks which would not have been there if, in fact, he has been shot from a distance, as the burnt gunpowder does not go such far from the muzzle of the weapon. Presence of dark burn marks around the wound shows that the bullet injury had been inflicted from a very close distance. Such burn marks would not have been there if in fact he had been running away from the car. Thus, the story put forward by the accused in his FIR about his being short by another person does not appear to be correct.*

27. With regard to the recovery of the pistol, the learned counsel is right that the pistol was recovered from a public place but it was recovered from the place which could not have been easily located by anyone and, therefore, the accused cannot get the benefit which the learned counsel wanted him to get. From the memo of recovery, it is clear that the pistol had been hidden by digging earth under a plant of Sarkanda about half a kilometre away from a bridge of Ladhuwala Uttar. Thus, it is very clear that the pistol had been hidden by digging earth under the plant of Sarkanda about half a kilometre away on the eastern katcha path from the bridge of Ladhuwala Uttar and, therefore, in our opinion, the recovery cannot be said to be from a place which could have been easily accessible to anyone.

28. With regard to recovery memo, the mistake committed in writing the word "witness" or "witnesses" cannot be said to be so material so as to adversely affect the case of the prosecution. In our opinion, such trivial mistakes should not give any benefit of doubt or any sort of benefit to the accused. In fact, the recovery was made in the presence of Ajaib Singh, Assistant Sub-Inspector and Balbir Singh, Head Constable. It is also not correct that the memo of recovery was not produced before the Court.

29. Exhibit P-46, which reveals the fact about the statement made by the accused in relation to pistol incorporates the entire statement made by the accused. Thereafter, the said document itself incorporates the statement made by the accused. Moreover, simply because the recovery was made in the presence of policemen would not adversely affect the prosecution case. A police officer can be a reliable witness if the court finds him to be a truthful person and in that event there is no harm in relying upon his statement. In the circumstances, we do not find anything objectionable if the pistol had been recovered in the presence of policemen.

30. With regard to the ownership of the pistol, it has been established by the prosecution that for a sum of Rs 90,000 the accused has purchased the pistol on 29 May 2001 whereas the offence has been committed on the night of 9 June 2001. Thus, the pistol had already been purchased by the accused. It is also pertinent to note that intimation with regard to the sale of the pistol had also been given by the seller of the pistol Jagtar Singh (PW-9) to the licensing authority and the said fact was established by PW-8 who is working in the Office of the DC, the licensing authority. Moreover, a sum of Rs 90,000 was paid by the accused for the purchase of the pistol which had been used in the offence.

31. Thus, with regard to ownership and possession of the pistol, the prosecution has proved beyond any doubt that the accused was not only the owner of the pistol in question but was also having possession thereof. It is also in evidence that the bullets which had caused injury to the deceased were fired from the said pistol. Mere non-production of a receipt issued by Jagtar Singh (PW-9) would not make the case of the prosecution weak as it has been duly established that the pistol was sold to the accused.

32. From the aforestated discussion and upon perusal of the evidence, we are satisfied that the trial court as well as the High Court while confirming the order of conviction, are not in error and the order of conviction deserves to be confirmed.

Author's Summary

It is a case of murder with a 12 bore shotgun fire. The postmortem doctor recovered 22 pellets from the deceased. The IO erroneously said that a 12 bore cartridge contain only 7-8 pellets. Defence tried to exploit the ignorance.

However the SC nailed the lie by quoting from the author's earlier Edition of this book

Highlights italicised

8.20.14 Number of Projectile in 12 Bore Cartridge[35]

Relevant Extracts (Verbatim)

This appeal by special leave arises out of the following facts.

One Lal Singh had three sons, Hari Singh, Jaswant Singh and Birbal Singh, Brij Pal Singh PW-1, Ved Pal and Gajender Singh are the sons of Birbal Singh whereas Suraj Bhan, Netar Pal and Satbir Singh are the sons of Jaswant Singh and Ram Pal and Ram Saran, the accused are the sons of Hari Singh, Hari Singh predeceased his father Lal Singh whereafter the joint land holding was partitioned by Lal Singh between his sons Jaswant Singh and Birbal Singh and the sons of Hari Singh deceased in equal shares retaining 18 bighas for himself. About 2-3 years prior to the incident Ram Pal Singh staked a claim that the tube-well on the land was his exclusive property on the plea that the electricity connection was in his father's name. Several civil and criminal litigations followed on account of this dispute and certain other matters with the result that the relations between the accused and Birbal Singh degenerated to an all-time low and about two days prior to the occurrence, an altercation had taken place between Birbal Singh and his son Brij Pal Singh on the one side and the accused on the other, relating to the use of the tubewell water. At about 8.30 am on 20 June 1991, Birbal Singh accompanied by his brother Jaswant Singh and his son Brij Pal Singh left the village to go to Muzaffarnagar for purchase of house-hold articles when they were accosted by the two accused, Ram Pal carrying his licensed DBBL .12 bore shotgun, and Ram Saran armed with a country made pistol and the accused fired a shot each in quick succession hitting Birbal Singh killing him instantaneously Jaswant Singh and Brij Pal Singh saved themselves by lying prone on the ground. The incident was also witnessed by several other persons who were passing by amongst them being Harvir Singh PW-2, Tejvir Singh PW-3, Amar Singh and Matroo Singh and on their challenge the assailants ran away, Brij Pal Singh PW-1 thereafter rushed to the village, wrote out a report and then went to police station, Tetawi, six kilometres away from the place of incident in a tractor and handed over the written complaint at 10.30 am leading to the registration of the FIR. SHO Brij Mohan Mishra accompanied by SI Rajinder Singh then reached the place of occurrence whereafter the SI recorded the inquest proceedings relating to the murder. He also picked up a spent cartridge case and wads of a shotgun cartridge and dispatched the dead body for the post-mortem examination. He also conducted a search of the house of Ram Pal and Ram Saran on 21 June 1981 and recovered a DBBL gun and 10 live cartridges licensed to the former therefrom.

35. *Ram Pal v State of Uttar Pradesh*, 2008 AIR SCW 101 : (2007) 14 Scale 394 : 2008 Cr LJ 1395 (SC).

The weapon and the cartridge case were sent to the Forensic Laboratory and its report revealed that the cartridge had been fired from the right barrel of the gun in question. On the completion of the investigation, the accused were charged for offences punishable under sections 302/149, I.P.C; and they pleaded not guilty and claimed trial.

Mr. Mahavir Singh has also seriously challenged the Forensic evidence in this case by arguing that though the spent cartridge case had been picked up from the spot on 20 June 1981 and the gun recovered the next day, both these items had been sent to the laboratory only on 17 September 1981 and as the 22 pellets recovered from the dead body had not been sent to the laboratory there was no justification in holding that the weapon had in fact been used in the murder. In support of his case Mr. Mahabir Singh has relied on *Palia v State of Punjab,* 1997 SCC (Cri) 383 : 1995 AIR SCW 3026 : 1995 Cr LJ 3232; *Baldev Singh v State of Punjab,* (1990) 4 SCC 692 : AIR 1991 SC 31 : 1990 Cr LJ 2604; *Santa Singh v State of Punjab,* AIR 1956 SC 526. He has also urged that as PW-10 Brij Mohan Mishra in his cross-examination had testified that there were about 7-8 small shots in a .12 bore cartridge, the recovery of 22 pellets from the dead body and the note regarding the smell of gun powder from the barrel of the gun, falsified the prosecution story.

We have considered these arguments very carefully. We first note that the facts that the cartridge case had been left by assailants at the spot and that the shots had been fired from a shotgun and a pistol find mention in the FIR. Interestingly also, there is a suggestion by the defence in the cross-examination as to whether the spent cartridge had been found near the dead body or at some distance therefrom. It is also clear from the statement of Ram Pal recorded under section 313, Cr PC that the gun which was licensed to him had been recovered from his house along with 11 cartridges. We have also perused the statement of PW-7 HC Rameshwar Prasad who stated that the weapon and other articles have been sent to the Muzaffarnagar city Malkhana on 2 July 1981 but had been returned to the police station as there was no place for storage and had been returned to the Malkhana on 13 July 1981 awaiting re-transmission to the laboratory. We also note from the statement of PW-9 Randhir Singh a retired constable who was at the relevant time the moharrir of the Malkhana at Muzaffarnagar in the police station that the weapon and cartridge in a sealed condition had been deposited with him on 2 July 1981 and had not been tampered with till their dispatch to the Forensic Science Laboratory.

We have also gone through the statement of Om Prakash Tripathi PW-8, the expert in the Forensic Science Laboratory who had examined the KF 12 bore fired cartridge case and DBBL gun No. 7902082 and had found that the said cartridge had been fired from the right barrel of the gun.

Seizing on the fact that 22 pellets had been recovered from the dead body and that PW-10 SHO Brij Mohan Mishra had deposed that a 12 bore cartridge contained only seven to eight pellets, Mr. Mahabir Singh has submitted that the prosecution story was on the face of it unacceptable. We find absolutely no merit in this plea. It has some in the evidence of PW-8 Om Parkash Tripathi that the cartridge used was of KF make (KF stands for Kirkee Factory). It is therefore, a cartridge manufactured by the Indian Ordnance Factory, at Kirkee, which has, off and on, been manufacturing cartridges of shot sizes BB to 9 only (this information has been reconfirmed from the Secretary, National Rifle Association of India, New Delhi).

A 12 bore shotgun cartridge carries a shot charge of twenty-five to thirty-five grams in weight and varying number of pellets based on several factors such as the length of the cartridge as would be clear from the following chart taken from Forensic Science in Criminal Investigation and Trials by Dr. B.R. Sharma (4th Edn.) at p 416:

Projectile Charge of Cartridges

Number per 28.35 gs.	*No. of Pellets mm.*	*Pellets diameter in gs.*	*Pellet Weight*
LG	*6*	*9.14*	*4.54*
SG	*8*	*8.43*	*3.54*
Special SG	*11*	*7.57*	*2.58*
SSG	*15*	*6.83*	*1.89*
AAA	*35*	*5.16*	*0.81*
BB	*70*	*4.09*	*0.40*
1	*100*	*3.63 (.16")*	*0.28*
2	*120*	*3.41 (.15")*	*0.24*
3	*140*	*3.25*	*0.20*

N.B. The equivalent in inches of the pellet size shown in brackets in the third column has been taken from Lyons Medical Jurisprudence and Toxicology, 11th Edn., p 913 and superimposed in the chart.

From the above table it can be concluded that KF manufactured cartridges can contain between 70 (BB) to 580 (9) pellets per cartridge. The 7-8 pellets that have been referred to by PW Brij Mohan Mishra would be pellets of buck shot such as SG/LG which are not manufactured by the Kirkee Factory.

The post-mortem report also shows that there were multiple wounds of entry 1/8th of an inch over the whole of the chest and upper half of abdomen in an area of 14 x 12, which confirms Brij Pal's statement that the two shots had been fired from a distance of about 40 or 50 feet. We are of the opinion that on account of dispersal of the pellets at that range, not all would have struck home. The recovery of 22 pellets therefore fits in with the prosecution story. The argument based on the gun powder smell from the barrel is equally without substance. In *Modi's Medical jurisprudence and Toxicology,* 23rd Edn. (p 723) while dealing with the topic as to *"the time when the weapon was fired"* it has been observed that "it is never possible to ascertain with any scientific accuracy the time when a weapon or cartridge was fired". In this situation, the judgments cited, which are based on their special facts, have no relevance to the facts of the present case.

We are, therefore, of the opinion that no fault can be found with the judgment of the High Court. We accordingly dismiss the appeal.

8.20.15 Ballistics Expert Evidence: Absence not Always Fatal[36]

The genesis of the prosecution case, in brief, was that on 13 October 1993 at about 11.50. a.m., one Sri Krishna Sharma (PW-1), husband of the deceased, lodged an F.I.R, with the Police Station Majhola, District Moradabad to the effect that on that day, at about 9.45 am, when he along with his wife and children was watching television, the appellant who was living opposite their house and was a cable operator along with his servant Dharamveer, came to their house and tried to persuade his son-Ravindra Sharma (PW-2) to take a cable connection from them. Not being interested in the cable connection, they declined the request of the appellant whereupon an altercation took place between the appellant and PW-2. The complainant and his wife intervened and asked the appellant to leave their house. The appellant went to his house, brought out the licensed revolver of his father and opened indiscriminate firing towards complainant's house from the door of his house. Some bullets hit the door of the house of Sri Krishna Sharma and while his wife, the victim, was closing the door, one of the bullets hit her in the jaw. Sri Krishna Sharma brought his injured wife to the hospital for treatment and thereafter lodged the F.I.R.

The victim was examined by Dr. Jagmal Singh, P.W-4. The following injuries were found on her person:

1. Lacerated wound 1.5 cm. x .5 cm x not probed on face, left side over left mandible, 3 cm. below and outer to left angle of mouth. Advised X-ray of left side face and left side neck.
2. Lacerated wound .5 cm x .5 cm x skin on left arm outer Pt 4 cm. above left elbow.

Both the injuries were found to be fresh. Injury No. 1 was alleged to have been caused by firearm but the final opinion was reserved to be given after the X-ray. Injury No. 2 was caused by a blunt object. On X-ray being taken, a radio opaque shadow elongated was found in thoracic spine in dorsal region over T 5-6.

The victim remained under treatment and supervision of Dr. D.S. Ahlawat (PW-5). On 15 October 1993, she was taken to Delhi for treatment. However, on 21 October 1993, she was again admitted in Moradabad Hospital, where she developed bedsores. Smt. Premwati ultimately died on 25 March 1994. As per the autopsy conducted by Dr. S.P. Singh (PW-7) on 25 March 1994, the ante-mortem injuries were mainly deep bedsores on various parts of the body and one old healed scar, size 12 cm x .5 cut, on the left face at the chin 2.5 cm. away from medium plank thoracic spine. On Internal examination, the doctor recovered a metallic bullet from her spinal cord.

Insofar as the testimonies of PW-1 and PW-2, the two star witnesses of the prosecution, are concerned, from the impugned judgment, it is manifest that the High Court, on analysis of their statements, has found these to be trustworthy. The High Court has observed that testimony of these two natural witnesses is of sterling character with no holes whatsoever. Based on this evidence, the High Court has found that it was the appellant who had opened fire from the revolver from his door, one of which had hit the victim, who had come to close the main door of her house. Nothing has been shown to us so as to warrant interference with the said finding recorded by the High Court. Therefore, in the context of this unimpeachable evidence, it stands proved that the appellant had gone to the house of the deceased; some unsavoury incident took place there; he returned to his house in a huff; took out the revolver of his father and fired shots towards the house of the deceased; one of the bullets hit the deceased and the same proved to be fatal. Having bestowed our anxious consideration to

36. *Vineet Kumar Chauhan v State of Uttar Pradesh*, AIR 2008 SC 780 : 2008 AIR SCW 1 (SC) :2008 Cr LJ 1367.

the evidence on record, in particular the testimony of P.W. 1 and P.W. 2, we are of the opinion that the High Court was correct in coming to the conclusion that the appellant was responsible for causing the fatal injury to the deceased. We are also in agreement with the High Court that though as per the post-mortem report the deceased died of septicemia and toxemia because of bedsores.

Reverting to the facts in hand, as noted above, it stands proved that there being a direct causal connection between the hitting of the bullet, fired by the appellant, to the deceased and her death, the death of the deceased was caused by the appellant. However, having regard to the circumstances, briefly enumerated above, particularly the manner in which the appellant fired the shots, in our view, the appellant could not be attributed the *mens rea* requisite for bringing the case under clause (3) of section 300, IPC. Concededly, there was no enmity between the parties and there is no allegation of the prosecution that before the occurrence, the appellant had premeditated the crime of murder. We are inclined to think that having faced some sort of hostile attitude from the family of the deceased over the cable connection, a sudden quarrel took place between the appellant and the son of the deceased, on account of heat of passion, the appellant went home; took out his father's revolver and started firing indiscriminately, and unfortunately one of the bullets hit the deceased on her chin. At the most, it can be said that he had the knowledge that the use of revolver was likely to cause death and, as such, the present case would fall within the third clause of section 299, IPC. Thus, in our opinion, the offence committed by the appellant was only "culpable homicide not amounting to murder". Under these circumstances, we are inclined to bring down the offence from first degree "murder" to "culpable homicide not amounting to murder", punishable under the Second Part of section 304, IPC.

Consequently, we partly allow the appeal; set aside the conviction of the appellant under section 302, IPC and instead convict him under section 304, Part II, IPC. The sentence of rigorous imprisonment for five years would meet the ends of justice.

8.20.16 Ballistics Evidence: Its Mis-appreciation[37]

Author's Summary

It is a case of murder in which the SC reversed the High court's order of conviction mainly on the basis of the Ballistics Expert's report, which de-linked the firearm of the accused and the cartridge case recovered from the crime scene.

Highlights italicised

Relevant Extracts (Verbatim)

Shortly stated the prosecution case was that one Pushu had two sons (i) Bhawan Singh, and (ii) Bhag Chand. Bhawan Singh had no issue and he died leaving behind him his widow Smt. Rukmani Devi. Bhag Chand also died leaving behind him four sons; (i) Shivraj Singh, (ii) Indra Singh, (iii) Rajpal Singh (deceased), and (iv) Puran Singh (accused). All the four brothers (sons of Bhag Chand) were residing in a jungle at a distance of about two kilometres from village Akhori, Patwari Circle Barab, Tehsil Ukhimath, District Chamoli. There were frequent quarrels between accused Puran Singh on the one hand and other three brothers on the other

37. *Puran Singh v State of Uttrakhand,* 2008 AIR SCW 662 : (2008) 3 SCC 795 : 2008 Cr LJ 1058 (SC).

hand in connection with the property owned and possessed by Rukmani Devi. According to the prosecution, Rukmani Devi had gifted her property by a registered gift-deed to accused Puran Singh depriving other three brothers from her share. On 3 August 1979 at about 4 pm, PW-5 Smt. Ramdei, daughter of PW-4 Shivraj Singh who had come to her parental house at village Akhori was grinding paddy with her deaf and dumb mother Smt. Swanri Devi near her house. At that time, accused Puran Singh came towards the cattle shed of Shivraj Singh and started beating she-buffalo of Shivraj Singh. Smt. Ramdei and her mother raised an objection. Accused got enraged and caught the wife of Shivraj Singh by her hair in order to beat her. Shivraj Singh happened to reach there and cautioned the accused. The accused went inside the room, brought his licensed gun and fired a shot towards Shivraj Singh who luckily escaped unhurt. On hearing the noise, other two brothers of Shivraj Singh, PW-2 Indra Singh and Rajpal Singh (deceased), came out to inquire as to what had happened. The accused started showing his anger towards them also. Both of them, therefore, decided to retreat from there. They were, however, chased by the accused who was carrying his gun. PW-2 Indra Singh asked Rajpal Singh (deceased) to run fast so that they may be saved. Rajpal Singh, unfortunately, turned his face backward to see as to how far away was the accused from him. The accused fired and the gun shot hit Rajpal Singh on his face and head. Rajpal Singh fell down on the ground. In the meanwhile, PW-3 Smt. Bardei, wife of Indra Singh and PW-6 Bimala, minor daughter of Rajpal Singh along with other children and family members reached near the place of incident. They could thus see the incident. Indra Singh was threatened by the accused and he went inside his house and got himself saved. Rajpal Singh became unconscious and remained as such till he was declared dead.

Initially, a case was registered against the appellant-accused in the First Information Report (FIR) for an offence punishable under section 307, IPC as also for an offence punishable under sections 25 and 27 of the Arms Act, 1959. After the death of Rajpal Singh, however, the charge was framed for committing an offence punishable under section 302, IPC. The case was committed to the Court of Session, Chamoli. A plea of the accused was recorded wherein he denied to have committed any offence, and claimed to be tried.

In order to establish the case against the accused, the prosecution examined eight witnesses. Out of them four witnesses were eye-witnesses, *viz.,* PW-2 Indra Singh, PW-3 Smt. Bardei, PW-5 Smt. Ramdei and PW-6 Kumari Bimala. It also examined PW-1 Pratap Singh-Pradhan of the village, PW-7 Dr. D.C. Awasthi and PW-8 Mitra Nand-Patwari.

So far as the death of the deceased Rajpal Singh is concerned, there is no dispute that he died homicidal death and it was due to firearm injuries sustained by him. PW-7 Dr. Awasthi, who performed post-mortem, found the following injuries on the body of the deceased:

(1) Firearm injury ½ cm in diameter circular in shape with inverted margins on right side of scalp parietal region, 5 cm above the top of right ear and 10 cm from the outer corner of the right eye with tattooing (impregnated black carbon particles) over an area of 12 cm x 10 cm over the right side of face, forehead and around the wound. It was wound of entry.

(2) Firearm lacerated injury oval shaped 2½ cm x 1 cm with irregular everted margins 2 cm behind injury No. 1. Clotted blood was present around it. It was wound of exit.

(3) Firearm lacerated wound 1 cm x ½ cm irregular in shape, 2 cm below and behind injury No. 2. It was wound of exit.

(4) Firearm lacerated wound 1 cm x three-fourth cm irregular in shape, 2 cm behind injury No. 2. It was wound of exit.

It was, therefore, clearly proved by the prosecution that the death of deceased Rajpal Singh was homicidal in nature and it was because of the gun injuries sustained by him.

The trial court considered the evidence of eye-witnesses and observed that except minor contradictions, there was no inherent improbability in their evidence. He, however, observed that from the evidence of Investigating Officer and the entries made in the Check Register that FIR and the relevant G.D. entries of the registration of the case, were made at a subsequent stage on some other date and not on 3 August 1979. There was thus 'every occasion for consultation and afterthought'. The trial court also observed that the accused stated that Rajpal Singh (deceased) was injured by a shot fired from the gun carried by a co-villager (Bachan Singh) when the deceased had gone for hunting with his brother Indra Singh and Bachan Singh (co-villager). According to the trial court, it might or might not be so but in view of suspicious circumstances, it could not be said that the prosecution had succeeded in establishing the guilt of the accused 'to the hilt and beyond all reasonable doubts'. In that view of the matter, according to the trial court, the accused was entitled to benefit of doubt. Accordingly, the trial court acquitted the accused.

Being aggrieved by the order of acquittal recorded by the Sessions Court, the State preferred an appeal under section 378 of the Code of Criminal Procedure, 1973. It was contended by the State that once the evidence of prosecution witnesses was believed by the Court and it observed that there was no reason to disbelieve the said evidence, the Court ought to have convicted the accused. It was urged that when the trial court did not find a material contradiction or inherent improbability in the prosecution evidence, the Court was wholly wrong in acquitting the accused.

The High Court re-appreciated the evidence of witnesses and held that the order of acquittal recorded by the trial Court was wholly unsustainable and totally unwarranted. Accordingly, the High Court set aside the order of acquittal and convicted the accused-appellant herein for an offence punishable under section 302, IPC and ordered him to undergo rigorous imprisonment for life as observed earlier.

The accused has challenged the order of conviction and sentence recorded by the High Court by filing the present appeal. On 10 April 2006, appeal was admitted and notice was issued on prayer for bail. On 24 November 2006, when the matter was called out, the Court fixed final hearing of the appeal and observed that in view of that order, it was not necessary to deal with bail application. Appeal is accordingly placed before us for final hearing.

We have heard learned counsel for the parties.

The learned counsel for the appellant raised several contentions. In our opinion, however, it is not necessary to deal with all the contentions in view of the fact that the appeal deserves to be allowed on a short ground.

The learned counsel for the appellant urged that from the opinion of the Ballistic Expert, it was clear that the bullet which caused the injury to the deceased was not fired from the gun said to have been used by the appellant, recovered from him and was examined by the Forensic Science Laboratory. If it is so, the prosecution was not successful in bringing home the guilt of the accused and in establishing that it was the gun of the accused which had caused firearm injury to deceased Rajpal Singh which resulted in his death.

The learned counsel for the State, on the other hand, submitted that the point raised by the learned counsel for the accused in this Court was neither raised before the Sessions Court (trial court) nor before the High Court (Appellate Court). No such point, hence, can be permitted to be raised in this Court for the first time in an appeal under Article 136 of the Constitution.

We would have indeed considered the submission of the learned Government Advocate but for the fact that there is sufficient evidence on record to show that what is sought to be contended by the learned counsel for the accused in this Court has substance and sufficient material is already on record in support of such plea.

We have been taken by the learned counsel for the parties to the record of the case. Exhibit Ka. 3 is the Arrest Panchnama dated 4 August 1979 when the accused was apprehended at about 8 am in the morning. In the memo of arrest as also in seizure memo, it was stated that 'no article was recovered from the body of the accused and nothing was seized by the police'. The accused had nothing except wearing clothes. In Daily Diary by Patwari Circle, Barab, Tehsil Okhimath dated 4 August 1979, it was mentioned that the Patwari started to the place of occurrence from village Senagadmari at about 5.30 am on 4 August 1979. At the place of occurrence, he found injured Rajpal Singh in the custody of villagers. The injured was breathing but was unconscious. The patwari tried to inquire about the incident from Rajpal Singh but the latter could not speak. Though treatment was given to the injured, he died. Inquest panchnama was thereafter prepared in the presence of persons who were there. The FIR was registered under section 307, IPC on the basis of the report dated 3 August 1979 by Partap Singh, Pradhan, but Rajpal Singh died and the case was registered under section 302, IPC. It was stated that "as the death of the injured Rajpal Singh was caused due to intentional gun shot by accused Puran Singh S/o Bhag Chand, therefore, the accused Puran Singh is taken into custody and the weapon used in murder *i.e.,* gun 1319/V-1970, Licence No. 697/Mly-74 and two empty cartridge Bore-12 recovered from the accused and sealed it at the spot in presence of witnesses".

Seizure Memo was prepared on the same day which reads thus:

> Today on dated 4 August 1979 in presence of (1) Shri Pratap Singh, Pradhan Village Panchayat Akhori, (2) Shri Bachan Singh S/o Ram Singh, (3) Shri Bhopal Singh S/o Tilak Singh, Village Akhori, Circle-Barab in the case No. 4/79 State through Pratap Singh, Pradhan, Gram Panchayat Akhori versus accused Puran Sineh S/o Bhag Chand, village Akhori under sections 302 IPC and 25/27 Arms Act, the licensed gun of accused called and ammunition was also called. Then the accused Puran Singh handed over to police his single barrel gun, bullet .12 bore No. 1319 V-1970, licence No. 697/ML4/34-V, booklet, two empty cartridges on which KF-12 Special 12 is written made in India by ORDNANCE FACTORIES and it was seized by police. Accused was asked to handover other ammunition. The availability of which accused denied. When the gun was opened it was not loaded with cartridges. The above recovered article was put in separate sack/packet and sealed. The memo was prepared in presence of witness and their signs were taken.

It is thus clear that even according to the prosecution, the weapon used by the accused for commission of crime *i.e.,* causing the death of deceased Rajpal Singh was recovered along with two empty cartridges. The mudamal gun as also empty cartridges were then sent to the Forensic Science Laboratory, Lucknow, which were examined by the Laboratory.

The prosecution witnesses who were cited as eye-witnesses and examined on oath have also stated that the gun used for commission of offence was recovered and the injuries were caused to the deceased by the accused from the said gun. For instance, PW-2-Indra Singh was shown gun (Ext. 1) and it was observed by the trial Court that "on seeing the gun Ex. 1 the witness told that this is that gun from which Puran Singh fired bullet". Similarly, PW-4-Shivraj Singh stated that it was the same gun. In para 6, it is observed; "Witness was shown Ex. Ka-1. He said that from this gun Puran Singh fired."

So far as medical evidence is concerned, PW-7-Dr. Awasthi had to say this:

"In my opinion, the death was due to coma which was as a result of head injury caused by the discharge of some firearm, which was sufficient in the ordinary course to cause death."

PW-8 Mitra Nand, Patwari stated in his substantive evidence, that he went to the house of the accused and arrested him. He further stated that the accused gave him his licensed gun of single barrel .12 Bore (Ex. 1) and two Cartridges (Exts. 6 & 7) which were sealed separately.

The Report of Forensic Science Laboratory dated 28 November 1979 is also on record. It states that the Laboratory received a letter from Chief Judicial Magistrate, Chamoli (Gopeshwar) along with two 12 bore K.F. Special emptied cartridges marked as E.C. 1 & 2 and one piece of gun 12 bore single barrel No. 1321. It was then stated that the examiner fired five shots from the gun which were marked as T.C 1 to T.C. 5, T.C. 1, T.C. 2 and T.C. 5 misfired and rest fired successfully. Regarding E.C. 1 and E.C. 2, it was stated that there had been signs of firing pin. But on E.C. 2, the signs were not specific. Cap of E.C. 1 had sign of breach and E.C. 2 had minor sign of breach. On the basis of the examination, a conclusion was given which is in the form of result which reads as under:

Result:

(A)

i. The cartridge in question E.C. 1 was not fired from the single barrel 12 bore No. 319 marked 1/79 gun.

ii. The cartridge in question E.C. 2 has no comparative feature with shot fired from gun No. 1319 .12 bore marked 1/79.

(B) On the chemical examination of fouling matter from the gun the nitrate was found from the gun so it is concluded that after last shot the gun was not cleaned but on 3-8-79 whether or not shot was fired from gun designative scientific opinion is not a possibility.

It is thus clear that as per Ballistic Expert's opinion, cartridge E.C. 1 was not fired from the single barrel 12 bore No. 1319 said to have been used by the accused. In our opinion, therefore, the appellant accused is entitled to benefit of doubt.

For the foregoing reasons, the appeal deserves to be allowed and is accordingly allowed. The order of conviction and sentence recorded by the High Court is set aside and the appellant is given benefit of doubt and is ordered to be acquitted. Since the appellant is in jail, he is ordered to be released forthwith if his presence is not required in any other case.

The appeal is accordingly allowed.

8.20.17 Air Gun Evidence[38]

Author's Summary

It is a case of murder with an Air gun. The investigation was haphazard with many lacunae. However, all the courts, (Trial, high and Apex) found adequate evidence to convict the accused.

Highlights italicised

Relevant Extracts (Verbatim)

Mr. A.T.M. Sampath, learned senior counsel appearing on behalf of the appellant, urged that the prosecution cannot be said to have proved the guilt of the appellant who was convicted only on the basis of purported circumstantial evidences. The learned counsel contended that the circumstances against the appellant were not such which could be said to have completed all links in the chain inasmuch as the ownership of the air gun was not proved. The pellets which were noticed by the autopsy surgeon in the dead body of Senthil had not been removed nor the recovery of the air gun can be said to have been made in accordance with the law. It was further submitted that the purported extra-judicial confession which was recorded by a person not authorized therefore in view of rule 72 of Criminal Rules of Practice (CRP) in

38. *Sivakumar v State of Tamil Nadu*, AIR 2006 SC 653 : 2005 AIR SCW 6360 : 2006 Cr LJ 536 (SC).

terms whereof a village Magistrate is prohibited from recording the extra-judicial confession or statement whatever made by an accused person after the police investigation has begun.

Mr. Subramonium Prasad, learned counsel appearing on behalf of the respondent, however, supported the judgment contending that the circumstantial evidences against the appellant had been fully proved in view of the fact that:

(i) he was last seen with the deceased;

(ii) his conduct in leaving the place of occurrence and going to the State of Kerala for a few days;

(iii) extra-judicial confession; and

(iv) recovery of air gun at his instance from Pappannan Thottam canal.

The High Court in its judgment relied upon the following circumstances:

(i) Evidence of PW-1 that he saw Senthil along with the appellant/accused-Siva Kumar, PW-7 Ravikumar on 17 September 1995, 11.00 am and that Senthil was last seen alive in the company of the appellant/accused.

(ii) The appellant/accused purchased M.O.I. Air Gun from the shop of PW-8. -Prakash; M.O.I. Air Gun is in working condition and the death was due to Gunshot wound and the opinion evidence of PW-11-17. P. Rajan (PW-9) is the forensic expert. In his evidence, he stated:

… The above gun was with .22 inches or 5.5 m.m. pipe dia and operated by air. I found the gun was in shooting condition while I shot it for test. The speed of the pellet shot from this gun is 400 feet per second. The pellets had not penetrate (sic) one inch thick deal wood plank at the range of 5 feets as per the tests done under the rules specified under Arms Act, 1962. So licence is not necessary to possess such a gun. The office copy of letter received from Judicial Magistrate No. 2 Polachi by Forensic Science Department, Chennai is Exhibit P-7. The test report submitted by me is Exhibit P-8. There is chance to cause death if the human body is shot from very nearer …

Contention of Mr. Sampath is that the air gun was received in two parts, namely, wooden part and iron part separately and, thus, the evidence of PW-9 should not be relied upon. We do not see any reason to accept the said contention because for the purpose of carrying out tests in the forensic laboratory, the iron part of the gun was material.

PW-10 was the head constable. His evidence is not material. Dr. Jothi Arunachalam (PW-11) conducted the post-mortem examination on the body of the deceased. As noticed hereinbefore, Mr. Sampath submitted that the pellets had not been recovered. PW-11 categorically stated that the foreign body seen through X-ray could not be recovered despite great effort made in this regard during post-mortem. He noticed that the penetrating injury was in the vital organ of the chest part.

In view of the aforementioned statement of PW-11, we are of the opinion that non-recovery of the pellets from the body of the deceased during post-mortem examination was not very material so as to discredit the entire prosecution case.

PW-12 is a formal witness who proved some documents. PW-13 is a retired head constable who registered the case. PW-14 is the Inspector of Police Station before whom the appellant was produced by the Village Administrative Officer. He recovered the air gun produced by the appellant which had been kept under the Pappanan Thottam canal at about 6.30 am on 30 September 1995.

The ownership of the air gun was not necessary to be proved. Recovery of the said air gun was made at the instance of the accused in terms of section 27 of the Indian Penal Code. When the possession of the air gun and recovery thereof had been proved, in our opinion, ownership takes a back seat.

8.20.18 Pellets Identification[39]

Author's Summary

It is a landmark SC judgment which appraised the linkage of buckshot with the shotgun in a case of murder and found it creditworthy. It had not been done before. It has important ramification, the most important being that the smooth bore firearm (including improvised firearms) can be linked to the fired ammunition through them.

Highlights italicised

Relevant Extracts (Verbatim)

K.G. BALAKRISHNAN.—Criminal Appeal Nos. 98-102 of 1999 and Criminal Appeal Nos. 109-114 of 1999 are filed by the State of Madhya Pradesh through CBI and the Criminal Appeal Nos. 103-108 of 1999 are filed by the Chhattisgarh Mukti Morcha. All these appeals arise out of the common judgment passed by the High Court of Madhya Pradesh on 26 June 1998. Nine accused persons were tried by the Second Addl. Sessions Judge, Durg, M.P. Accused Nos. 1 to 8 were charged for the offence under section 302 read with section 120B IPC. The 9th accused was charged under section 302 read with section 120B, and in the alternative, section 302 read with section 34 IPC and section 25(1)(A) and section 27 of the Arms Act. The Sessions Judge acquitted A-6 Naveen Shah, A-7 Chandrabaksh Singh and A-8 Baldev Singh Sandhu. A-1 Chandrakant Shah, A-2 Gyan Prakash Mishra, A-3 Avdhesh Rai, A-4 Abhay Kumar Singh, A-5 Moolchand Shah and A-9 Paltan Mallah @ Ravi were convicted by the Sessions Judge for the offence under section 302 read with section 120B. A-9 Paltan Mallah was found guilty of the offence punishable under section 302 IPC and sentenced to capital punishment whereas other accused were sentenced to life imprisonment. The High Court by the impugned Judgment acquitted all the accused of the charges framed against them.

Deceased Shankar Guha Niyogi was a popular, powerful trade union leader in the industrial region of Bhillai, Durg, which was part of the then State of Madhya Pradesh. Deceased Shankar Guha Niyogi had been working for the welfare of the labour demanding living wages, bonus, reinstatement of retrenched workers and he organised the workers of the various industrial units at Bhillai and Durg. The labourers had an organisation by name "CHATTISGARH MUKTI MORCHA" (hereinafter being referred to as CMM") and deceased Niyogi became a leader of this organisation. He was leading the labourers working at Rajaram Mines area which was a main source of raw material iron ore for the Bhillai Steel Plant at Durg. In the year 1989, there was an agitation by the workers of the industrial unit by name ACC, which is a leading cement manufacturer. A settlement was reached at the instance of deceased Niyogi. The workers in other industrial establishments sought the help of deceased Niyogi to solve their problems. In the year 1990, he came to Bhillai and started occupying quarter No. MIG 1/55 of HUDCO. He stayed there with his servant Bahal Ram. The other members of his family continued to stay near Rajhara. Deceased Niyogi set up an office for CMM at MIG-2/273 HUDCO. In the year 1990, there was widespread labour movement against the management of various industrial units such as Simplex, Kedia, B.E.C. B.K, According to the prosecution, the management of these industrial units started opposing the labour movement and there was even physical attack on some of the leaders of CMM. One Uma Shankar Rai, a leader of CMM was fatally assaulted by the agents of the industrialists. Deceased Niyogi apprehended serious threat

39. *State of Madhya Pradesh v Paltan Mallah*, AIR 2005 SC 733 : 2005 AIR SCW 455 : 2005 Cr LJ 918 (SC).

to his life from the industrialists, especially from Simplex and Kedia Group of Industries. He made notes in his diary regarding the apprehension of danger from the management of these industrial units. On 27 September 1991, he had gone to Raipur and there he met one Rajendra Sail, Secretary General of PUCL and reporter N.K. Singh of "India Today". He expressed an apprehension of danger to his life from Kedia and also from A-5 Moolchand Shah and A-l Chandrakant Shah of Simplex Group. On 27 September 1991 at about midnight, he left Raipur for Bhillai and reached his quarter No. MIG- 1/55 of HUDCO and went to bed. His servant Bahal Ram was occupying the neighbouring room. In the night, Bahal Ram heard a noise like bursting of crackers and he rushed to the room of Niyogi and found Niyogi writhing in pain on his bed. The window was found open. Bahal Ram called for help of the neighbour Sripad Mategaonkar. Few workers from the CMM came to the place and it was found that Niyogi had been shot. He was immediately taken to the Sector 9 Hospital of Bhillai. Before reaching the hospital, Niyogi succumbed to the gun shot injuries. Post-mortem examination was conducted by a team of doctors and they opined that death was due to bullet injuries.

Preliminary investigation was carried out by PW-182 Deputy Superintendent of Police Shri M.G. Agarwal. There was agitation by the workers that investigation shall be conducted by the Central Bureau of Investigation and the Government of Madhya Pradesh requested the Union of India seeking help of the Central Bureau of Investigation. As part of police investigation, PW-182 visited the scene of occurrence and got a prepared map of the site and he took steps to see that viscera of the victim was sent for laboratory tests. He took into custody the pellets recovered from the body of Niyogi. He took statements from Bahal Ram, the servant and also from the widow and daughter of deceased. He got prepared photograph Exh. P-180 to P-196. He got report from Serum Science and Chemical Analysis which are marked as Exh. P-430 to P-432. He recorded statements of various other witnesses. Accused A-3 Avdhesh Rai was taken into custody on 13 October 1991. On 1 November 1991, he seized diary of deceased Niyogi and on 9 November 1991 he handed over the investigation to CBI officials.

PW-187 R.S. Dhankad took over the investigation along with PW 192 R.S. Prasad. PW-187 held search of Oswal Industry. He recorded the statements of Zakkiruddin on 21 November 1991. This witness identified the photographs of A-2 Gyan Prakash Mishra and A-3 Abhay Kumar Singh. PW-192 conducted further investigation of the case along with other officers. On 10 November 1991, he seized the window curtains from the house of Niyogi. On 15 November 1991, he conducted searches of the business premises of Jain and Shah and Company, 108 A. Khan Goga Complex and recovered articles under Exh. P-297.

> ***After the arrest of accused Paltan Mallah on 25 August 1993, he got recovered .12 bore country made weapon, 13 live cartridges of 12 bore, a foreign made revolver, 6 live cartridges of .38 bore and a red colour Suzuki Motorcycle. He sent Exhs. P-403 and 404 to Central Forensic Laboratory (CBI), New Delhi. He conducted various other searches and recovered incriminating articles from the other accused. After investigation, final report was filed.***
>
> **On the side of prosecution PW-1 to PW-192 were examined by the trial court.**

The High Court by the impugned judgment acquitted all the accused and that is challenged before us.

Then the most important item of evidence against the accused, Paltan Mallah, is the report of the ballistic expert. PW-192, the Deputy Superintendent of Police of the CBI deposed that after the arrest of the appellant Paltan Mallah on 25 August 1993, he recovered

one .12 bore improvised pistol, 13 live cartridges .12 bore, one foreign made pistol, 6 live cartridges of .38 bore and a motorcycle. The improvised pistol, the foreign made pistol and the cartridges were sent for examination by the ballistic expert to the Central Forensic & Science Laboratory, New Delhi. During the post-mortem of the deceased Shankar Guha Niyogi, three pellets were extricated from his body. These pellets were sent to Forensic Laboratory at Sagar and thereafter they were deposited in the court by PW-192 and these pellets were also later on obtained from the court and sent for examination by the CFSL. PW-159, the ballistic expert conducted detailed laboratory test-fires and microscopic examination and he gave Exh. P-398 report wherein he opined that three lead pellets marked P-1 to P-3 must have been fired from a .12 bore improvised pistol. He deposed that he had prepared the report on the basis of the microscopic examination and he had also taken photographs of the pellets and Exh. P-398 are the work-sheets of the report prepared by him.

The evidence of PW-159 and his report are seriously challenged by the counsel for the respondent accused. He extensively referred to the text books written by foreign ballistic experts such as Burrad, Hatcher and Taylor. It was argued that in the instant case, the weapon was an improvised pistol and the barrel was not grooved and there was absolutely no question of any identifiable marking coming on the pellets to enable the expert to give any opinion whatsoever. Reliance was placed by him on the observations of this Court in Ram Avtar v Ram Dhavi, (1997) 2 SCC 263 : 1996 AIR SCW 4264 : AIR 1997 SC 107 : 1996 All LJ 1908 wherein this Court relied on the opinion of J.S. Hatcher in his text book of Firearms & Investigation to the effect that "unless there were rifling marks in the bullets which were not defaced by the entry in the bodies of the victims, no expert can ordinarily and generally give an opinion. It was also pointed out that in the case of improvised pistol, it was difficult to assume that the ballistic expert could have found identifying marks on the pellets. The evidence given by the ballistic expert was questioned in great detail. He was cross-examined extensively by counsel for all the accused. He deposed in the cross-examination that when these pellets are fired, then they among themselves would press each other inside the barrel [on inside parts] their effect could be on one side of inner side of barrel, they will take special individual mark on them and these marks will be in the form of a line on the pellets and if the barrel is tight then pellets will be more rubbed, and on more parts, lines will come. If barrel is tight then half part of the pellets are pressed and the barrel was nicely tight and the witness himself said that in the test fire which he did on all of the six pellets good marks of barrel had come. He had also stated that he had taken micro-photograph of only one pellet and had compared all pellets but he had not made any separate comparative record or photograph.

It was argued that micro-photographs were not produced and mere observation by the expert—was not sufficient and that he should have produced these photographs. We do not think that there was any such necessity to produce the micro photographs when the expert has given convincing reasons to support his opinion.

This Court in *Ramanathan v State of Tamil Nadu,* (1978) 3 SCC 86 : 1978 Cr LJ 1137 : AIR 1978 SC 1204 para 26 held that the production of such photographs is not necessary and such a plea was rejected. In para 26, it was held as under:

> It is true that there has been considerable difference of opinion amongst investigators regarding the use of photographs in a court for the purpose of illustrating the matching of the markings, and while it may be that microscopic photographs, when taken with due care and in the best of conditions, may enable the evidence to be placed on the record in a visible form, it cannot be denied that a court would not be justified in rejecting the

> opinion of an expert who has examined the markings under the comparison microscope simply for the reason that he has not thought it necessary to take the photographs. It is therefore not possible for us to reject the evidence of Ramiah (PW-23) who has categorically stated that he had compared the land and groove markings on the bullets under a comparison microscope, simply because he did not think it necessary to take the photographs.

In the case of the respondent-accused Paltan Mallah, there is overwhelming evidence to prove his complicity in the crime. The recovery of the improvised pistol at his instance, which is proved to have been used for causing the death of Shankar Guha Niyogi; and the evidence of the ballistic expert coupled with two extra-judicial confessions made to PW-105 made PW-124 support the prosecution case fully. There is also prosecution evidence to the effect that the accused had got accessibility to the weapons and that he was staying at the place of occurrence and doing various jobs. It is also established that accused Paltan Mallah is involved in other offences relating to firearms. Though there is no direct and convincing evidence against other accused, the case against Paltan Mallah is proved beyond reasonable doubt. He was acquitted by the High Court on fanciful reasons. The evidence of extra-judicial confessions was rejected without any valid reasons. The report of the ballistic expert also was not appreciated in the correct perspective by the High Court. In our view, the Division Bench seriously erred in acquitting the respondent-accused Paltan Mallah.

In the result, we reverse the acquittal of the respondent-accused Paltan Mallah. The incident leading to these appeals had taken place as early as 1991. As there is a long lapse of time, we do not think that the sentence of death imposed upon him by the Sessions Court is justified in the circumstances. We set aside the acquittal of respondent-accused Paltan Mallah and find him guilty of the offence punishable under section 302 IPC and sentence him to undergo imprisonment for life.

8.20.19 Firearm Injuries: Proper Post-mortem[40]

Author's Summary

It is an unfortunate case in which utter ignorance/negligence was shown by the doctors in the postmortem examination of the victim. They failed to locate/extract the foreign bodies in the body of the deceased.

The lacunae/negligence/ignorance was over come in a Medical college by simply taking X-rays pictures.

Highlights italicised

Relevant Extracts (Verbatim)

The case of the prosecution is that on 14 March 1997 at about 8.00 pm in village Kudar Bagha, 4 persons including the appellants herein came near the house of the deceased. When the deceased emerged from his Angan and came to the *dalan*, appellant Ranjan Singh exhorted his companion, appellant Nirmal Singh to shoot the deceased, as a result of which appellant Nirmal Singh fired at the deceased and shot him in the abdomen. The case of the prosecution is that apart from the appellants, the other two were also armed, one with a country made pistol and the other with a lathi. Further case of the prosecution is that after the deceased was injured, the members of the family, who are the witnesses, chased them and while retreating

40. *Nirmal Singh v State of Bihar*, AIR 2005 SC 1265 : 2004 AIR SCW 6717 : 2005 Cr LJ 672 (SC).

all the three accused who were armed with improvised pistols, fired at them but no one was injured. The assailants made good their escape. According to the prosecution, the motive for the occurrence was that 3 days before the incident deceased was returning to his house in village Kudar Bagha and while he was passing in front of the house of the appellant Nirmal Singh, the bundle carried by him on his head touched the roof of the house of appellant Nirmal Singh, which caused a slight damage to the tiles of his roof. This gave rise to an altercation and abuses were exchanged between the parties. It was on account of this incident that appellant Nirmal Singh bore a grudge against the deceased and committed the offence as alleged.

The dead body of the deceased was sent for post-mortem examination which was first conducted by Dr. Gupta, PW-13 on 15 March 1997 at 12.00 noon. Dr. Gupta found an incised penetrating wound on the right side of the abdomen of the deceased which according to him had been caused by a sharp cutting weapon.

It appears that the informant was aggrieved by the finding of the doctor PW-13 who conducted the post-mortem examination and complained to the Chief Judicial Magistrate that the post-mortem had not been fairly conducted. On the orders of the Chief Judicial Magistrate, a second post-mortem examination was conducted by a board of 5 doctors which included Dr. Ganesh Mahto, PW-12, the civil surgeon.

The second post-mortem examination was conducted on 17 March 1997 at 5.30 pm. The finding of the medical board was that there was an oval wound on the right lumber of the area of abdomen anteriorly, size about 2" x (1½)" abdominal cavity deep. The margins were eaten away by the maggots. There was no evidence of blackening or tattooing on the abdominal wall around the wound or anywhere else on the body. The internal organs were in the stage of decomposition and partly eaten away by maggots. All the viscera of abdominal and chest cavity were palpated and dissected for the search of metallic foreign body, but despite vigorous search no-metallic foreign body could be found anywhere in the viscera or in the abdominal and chest cavity. The board could not give any definite opinion relating to injury on the body, but it recommended further detailed investigation and for that purpose recommended that the body be sent to the Department of Forensic Medicines and Toxicology, Patna Medical College Hospital, Patna.

Accordingly, the body was sent to the Patna Medical College Hospital and on 20 March 1997 another post-mortem was done by Dr. A.K. Singh, Tutor Department of Forensic Medicines and Toxicology, Patna Medical College Hospital, Patna. In his report he recorded as follows:—

> ***Erosion of the anterior surface of the 5th vertebra was noticed of one-second" diameter. In view of the advise of the medical Board, (C.S. Chapra) for Skiagram X-ray of chest and abdomen, A.P. View was suggested which was done by the Radiology Deptt. of P.M.H.C. Patna by a Portable X-ray machine, in the Mortuary. The report received from the radiology Deptt. P.M.H.C. with two plates bearing No. – PM/365 dt. 20 March 1997 which read as such – chest A.P. – No evidence of radio opaque shadow seen. N.V. Longitudinal foreign body shadow seen in left side Abdomen with pelvis view A.P. A Radio opaque shadow (F.B.) seen in L/5 level, left side, report was signed by Dr. (Mrs.) Aruna Jaiswal, Associate Professor, Dept. of Radiology, P.M.H.C. Patna.***
>
> ***(2) The 5th Lumbar vertebra was opened and examined and a bullet was recovered from the body of the vertebra which was kept in a glass vial properly levelled, sealed and handed over to constable No. 233 Dhaneshwar Yadav, P.S. Garkha with instruction to hand that over to the I.O. immediately.***

8.20.20 SBML v DBML Guns[41]

Author's Summary

Muzzle-loader firearm is a rare species now. It was used in this case for murder. It created a comedy of errors all round:

1. IO failed to get pellets evaluated or produce intelligible sketch of the crime scene.
2. Prosecutor failed to produce Ballistics expert.
   - The trial court inspected the crime scene at wrong time and did not probe the pellets. The first appellate court surpassed all: Misconceived that the single barrel muzzle loader was wrongly used.
   - Did not call the ballistics expert for proving his report and understanding the working of muzzle-loaders
   - Misinterpreted the emergence of injury No 2. Raising of arm(s) is natural reflex action).
   - Failed to give credence to the eyewitness accounts.
   - Made a mountain of non-injuries on the eyewitness. The target of the assailant was the victim, not witnesses.
3. SC misread section 293 of Cr P C. JSO is not covered in Sub-section 4 of Section 293 of Cr P C.
4. In spite of these comedies of error, the SC provided real justice

Highlights italicised

Relevant Extracts (Verbatim)

Briefly stated the facts are as follows:—The accused and the prosecution witnesses are all from the same village Sug Tarkhana, Tehsil Indora, District Kangra. The accused and P.W.-5 Gian Chand were at loggerheads over the dispute of abadi and civil litigation between them was pending. The deceased Uttam Chand was employed as a carpenter at Delhi and had come to village on 5 August 1995 to attend the performance of first death anniversary of his mother. It is stated that on 14 August 1995 at about 10.00 am. Gian Chand-PW-5 had an altercation and quarrel with the accused Mast Ram with regard to the dispute over the abadi and the deceased Uttam Chand said to have intervened and advised both Gian Chand and Mast Ram not to quarrel and wait for the decision of the court in civil litigation. Thereupon, the accused Mast Ram became furious and threatened the deceased Uttam Chand that he would deal with him first of all as he was siding with Gian Chand with whom the accused had the civil dispute over the abadi. It is further stated that at about 10.30 am on the same day, when the deceased Uttam Chand along with his brother Hans Raj PW-1 and Vijay Kumar PW-3 was proceeding towards the fields to get fodder for the cattle and was passing through the passage in front of the house of the accused Mast Ram, the accused with DBML (Double Barrel Muzzle Loaded) gun in his hand challenged Uttam Chand stating that he would be done to death and then fired at Uttam Chand. The deceased Uttam Chand received injuries on his arm, chest and shoulder, fell down on the ground, and became unconscious. Thereafter, the accused ran away

41. *State of Himachal Pradesh v Mast Ram*, AIR 2004 SC 5056 : 2004 AIR SCW 5754 : 2004 Cr LJ 4973.

towards the field with his gun. In the meantime, PW-4 Tarsem Lal also arrived and PWs 1, 3 and 4 together shifted the deceased Uttam Chand to his nearby house where he breathed his last after sometime. The matter was reported to the Pradhan of the village, who advised to lodge a report with the police and the First Information Report was, accordingly, lodged. The accused was arrested on 18 August 1995 by PW-15 and pursuant to a disclosure statement, the DBML gun (Ex. P-11) was recovered from underneath the bushes near his house. Ex. P-11 was sent for examination to the Forensic Science Laboratory and it was found to be in working condition and having been fired. The accused pleaded ignorance in his statement under section 313 but he did not lead any defence evidence. The spot inspection, was however carried out at the request of the accused in his examination under section 313. It appears that the defence of the accused in his examination under section 313 was that from the place where the accused is alleged to have fired at the deceased and the place where the deceased was standing and hit by the gun shot was not within the firing range. This has led to the trial court for a spot inspection. The inspection was carried out by the trial court on 25 February 1996 in the presence of the accused, his counsel and the Public Prosecutor. The trial court conducted a test gunshot fire from the place where the accused was alleged to have fired at the deceased and it was observed that the place where the deceased was standing and hit by the gunshot was within the firing range.

The trial court after considering the evidence and eye-witnesses accounts of PWs. 1, 3, 4 and PW-2 Dr. Sanjay Kumar Mahajan, who conducted the post-mortem examination and the report of the forensic laboratory has recorded findings that the prosecution has established his case beyond all reasonable doubts and convicted the respondent as aforesaid.

The High Court upset the conviction recorded by the trial court,

Firstly, that the DBML gun (Ex. P-11) alleged to have been used in the commission of offence was not used in a test fire at the time of local inspection conducted by the trial Court and instead a test fire was carried out with the help of SBML (Single Barrel Muzzle Loaded) gun belonging to PW-1 Hans Raj. The High Court held that this has materially affected the prosecution story. According to the High Court, the firing range differs from gun to gun and, therefore, the firing test not having been conducted from the Exhibit P-11, the finding of the learned trial court Judge that the deceased has been hit by the gunshot was within the firing range from the verandah of the house of the deceased could not have been relied upon. This finding, in our opinion, is not only fallacious but also perverse. While it is true that generally, the firing range of the gun differs from gun to gun, the opinion of the High Court that firing range of DBML gun and SBML gun differs is based on no expert opinion and the same is based on conjectures and surmises. In the instant case both the guns are of the same categories except the one used in the commission of the crime is Double Barrel and the one used during the test fire was the Single Barrel. Therefore, it cannot be said that the firing range from DBML gun differed from SBML gun or vice-versa.

That apart, the local inspection envisaged under section 310, Cr PC. is for the purpose of properly appreciating the evidence already recorded during the trial. Memorandum of spot inspection recorded by the trial Judge has to be appreciated in conjunction with the evidence already recorded. Any omission and/or commission in the memorandum recorded by the trial, Judge by itself would not constitute material irregularity, which would vitiate the prosecution case. In our view, it is difficult to accept the reasoning recorded by the High Court in this regard.

Secondly, the ground on which the High Court has thrown out the prosecution story is the report of ballistic expert. The report of ballistic expert (Ex. P-X) was signed by one junior scientific officer. According to the High Court, a junior scientific officer

(Ballistic) is not the officer enumerated under sub-section (4) of section 293 of the Code of Criminal Procedure and, therefore, in the absence of his examination such report cannot be read in evidence. This reason of the High Court, in our view, is also fallacious. Firstly, the Forensic Science Laboratory Report (Ex. P-X) has been submitted under the signatures of a junior scientific officer (Ballistic) of the Central Forensic Science Laboratory, Chandigarh. There is no dispute that the report was submitted under the hand of a Government scientific expert. Section 293(1)[42] of the Code of Criminal Procedure enjoins that any document purporting to be a report under the hand of a Government scientific expert under the section, upon any matter, or thing duly submitted to him for examination or analysis and report in the course of any proceeding under the Code, may be used as evidence in any inquiry, trial or other proceeding under the Code. The High Court has completely overlooked the provision of sub-section (1) of section 293 and arrived at a fallacious conclusion that a junior scientific officer is not an officer enumerated under sub-section (4) of section 293. What sub-section (4) of section 293 envisages is that the court to accept the documents issued by any of six officers enumerated therein as valid evidence without examining the author of the documents.

Thirdly, the High Court was of the view that during the course of post-mortem examination conducted by PW-2 Dr. Sanjay Kumar Mahajan, two pellets were recovered-one each from the right and left lung of the deceased, which were handed over to the police. However, the pellets recovered were never sent for examination to a ballistic expert in order to find out if such pellets were fired from the gun (Ex. P-11) or not. According to the High Court, failure of the prosecution to send the pellets for examination by a ballistic expert will draw an inference against the credibility of the prosecution story. This finding, in our view, is utterly perverse. It is not the requirement of law that pellets recovered from the body be sent to ballistic expert to determine as to whether the pellets were fired from the exhibited gun or not. On the contrary, the recovery of pellets from the body clearly establishes the prosecution case that the deceased died of gunshot injuries.

The fourth reason assigned by the High Court in discarding the prosecution story is with regard to the non-explanation of injury No. 2 on the body of the deceased. The injury No. 2 was described as under:—

"A circular area about 1.5 cm diameter in left axilla towards the left arm."

PW-2 Dr. Sanjay Kumar Mahajan during the course of cross-examination stated that the aforesaid injury could not have been caused had the injured Uttam Chand not raised his arm while walking. The High Court was of the view that PW-1 and PW-3 who were accompanying the deceased Uttam Chand at the relevant time had never stated that deceased Uttam Chand had at any point of time raised his arm while walking or on being challenged by the accused, It is the categorical statement of PW-1 Hans Raj and PW-3 Vijay Kumar that while they were accompanying the deceased, the accused had challenged the deceased and thereafter fired at him. It is but quite natural that the deceased when challenged would have reacted by raising his hands either in defence or in accepting the challenge and in the process he would have sustained injury No. 2, as described. The reaction of the deceased in raining his hands, in such circumstances, would be in tune and in consonance with the natural human behaviour in ordinary circumstances. There is no set of rule that one must react in a particular way. The natural reaction of man is unpredictable. Every one reacts in his own way. Such natural human behaviour is difficult to be proved by credible evidence. It has to be appreciated in the context of given facts and circumstances of each case.

42. The sub-section 4 has specified to which the section 293 is applicable. JSO is not included in it.

Fifthly, the High Court was also of the view that PW-1 Hans Raj and PW-3 Vijay Kumar were accompanying the deceased and the prosecution story shows that the pellets from the gun shot had scattered and hit even the tree but the absence of injuries on the person of PW-1 and PW-3 render their presence at the place of occurrence doubtful. This finding of the High Court in our opinion, is also fallacious and perverse, PW-1 and PW-3 had categorically stated that the deceased was walking ahead of them. The accused undisputedly nurtured a grudge against the deceased for alleged siding with the PW-5 Gian Chand, with whom the accused had civil dispute, challenged the deceased, the gun was aimed at and fired at him. It is, in these circumstances, the absence of pellet injuries on the persons of PW-1 and PW-3 will be no ground to render the presence of PW-1 and PW-3 at the place of occurrence doubtful.

The last and the most perverse and fallacious finding of the High Court is with regard to discarding the evidence of eye-witnesses account of PW-1 Hans Raj and PW-3 Vijay Kumar.

The High Court recorded the finding as under:

> PW-1 Hans Raj is the real brother of the deceased, while PW-3, Vijay Kumar, apart from being a cousin brother of the deceased is the son of PW-5, Gian Chand, with whom admittedly the accused had litigation, it is the prosecution own case that the accused was nursing a grudge against the deceased and PW-1, since they were helping and siding with PW-5, Gian Chand. Both PW-1 and PW-3 are, therefore, interested witnesses and in view of the evidence coming on the record, cannot be safely relied upon.

As already noticed PW-1 Hans Raj and PW-3 Vijay Kumar are two eyewitnesses who accompanied the deceased on the fateful day. Both the eye-witnesses had stated categorically that they accompanied the deceased while going to the fields to fetch fodder for the cattle. When they were passing through the passage in front of the house of the accused, the accused challenged the deceased and in the meantime fired at him, with the result deceased Uttam Chand fell down on the ground after having sustained gunshot injuries on his person. The two eye-witnesses were subjected to lengthy cross-examination but nothing could be elicited to doubt the creditworthiness of their testimony. No doubt; that PW-1 and PW-3 are relatives but this will be no ground to disbelieve their testimony, if otherwise, inspired confidence.

The law on the point is well-settled that the testimony of relative witness cannot be disbelieved on the ground of relationship. The only requirement is to examine their testimony with caution. In the given facts of the case, it is but quite natural that the relatives would have accompanied the deceased to collect the fodder for the cattle from the fields at about 10.30 am on the fateful day. It is also in the prosecution evidence that the incident at 10.30 am is preceded by an altercation and quarrel between the accused Mast Ram and PW-5 Gian Chand, on the same morning at about 10.00 am with regard to the disputed abadi and the deceased Uttam Chand is said to have intervened in the matter and advised both PW-5 Gian Chand and the accused Mast Ram not to quarrel and wait for the decision of the civil litigation. It is also in the evidence that thereupon the accused Mast Ram threatened the deceased Uttam Chand that he would deal with him first of all as he was siding with Gian Chand with whom the accused is having pending litigation with regard to abadi. The categorical testimony of eye-witnesses account has not been considered and discussed at all by the High Court. Their testimony was thrown out at the threshold on the ground of animosity and relationship. This is not the requirement of the Law. That apart PW-4. Tarsem Lal is an independent eye-witness. PW-4 also hails from the same village. He is neither related to the complainant party nor to the accused party. He has stated that he saw the accused Mast Ram in his verandah with a gun in his hand and also saw him running away from the spot after the gunfire. The High Court has not considered and discussed the testimony of PW-4 at all.

The testimony of PWs, 1, 3 and 4 was consistent with the report of ballistic expert and the evidence of PW-2 Dr. Sanjay Kumar Mahajan who conducted the post-mortem examination on the body of the deceased and found the following injuries:—

1. A circular area about 1 cm diameter on Antero-lateral surface of left arm about 9 inches from Acromion.
2. A circular area about 1.5 cm diameter in left Axilla toward left arm.
3. A circular area about 1 cm diameter on Anterior surface of left shoulder,
4. An area circular about 1.2 cm diameter about 3 cm below injury No. 3.
5. A circular area of 1.3 cm diameter on medial wall of left axilla which is formed by chest wall. Tract has been formed on Probing:-3 inches of probe went inside,
6. A circular area of about 1.4 cm diameter in left Infra clavicular region 7 cm below mid clavicular point.
7. A circular area 1.2 cm diameter about 2.3 cm below injury No. 6.
8. An area 2 cm x 1 cm about 2 cm away from left nipple mediosuperior.
9. An area of 3.2 cm x 2.3 cm on sternum about 5 cm below sternal notch.
10. An area of 4.1 cm x 2.3 cm above left costal margin about 5 cm away from Xiphi-Sternum.
11. A circular area of 1 cm diameter on right side of sternum.
12. An area of 7.2 cm x 2.1 cm on right side of chest in Midline about 10 cms below mid clavicular point, widest in centre, tapering on periphery.
13. An area of 6.5 cm x 3.1 cm about 13 cm from medial end of eight clavicle.
14. An area of 15 cms diameter just below right nipple:

On probing; No. 13 it came out of injury No. 14 though subcutaneous planner."

PW-2 Dr. Sanjay Kumar Mahajan, opined that all the injuries were ante-mortem having been sustained by a firearm like gun and such injuries were sufficient in the ordinary course of nature to cause death.

In our view, the consistent ocular testimony of PWs 1, 3 and 4 corroborated by the opinion of PW-2 Dr. Sanjay Kumar Mahajan and ballistic expert report clearly established the prosecution case beyond all reasonable doubts and the High Court fell into grave error of law and facts, resulting in grave miscarriage of justice.

For the foregoing reasons, the order of the High Court is set aside and the order of the trial court is restored. The appeal is allowed. The bail bond of the respondent-accused Mast Ram is cancelled. He is directed to be taken back into custody forthwith. Compliance report within one month from today.

8.21 CASE LAW

8.21.1 Conviction on Firearm Evidence Alone[43]

Author's Note

It is a landmark judgment on Forensic Ballistics. In this case of murder the SC ruled that conviction of a murderer can be based upon ballistics expert's opinion alone. They have cited numerous authorities to support the view.

Highlights italicised

43. *Kalua v State of Uttar Pradesh*, AIR 1958 SC 180 : (1957) SCR 187 : 1958 Cr LJ 300 (SC).
Also see *Meera Puri v State of Nagaland*, 1971 Cr LJ 539 : 1971 Assam LR 22 (Ass and Nag).

While the sessions judge believed the testimony of the eyewitnesses, the learned judges of the High Court were of the opinion that they were unable to accept the assertion of the eye-witnesses that they actually saw the appellant with a pistol by the bed-side of the deceased. The High Court, however, relied upon the circumstantial evidence in the case in upholding the conviction of the appellant. There was a motive for the crime and a few days before the killing of Daya Ram, the appellant had held out a threat against him. The appellant was arrested fourteen miles away from his village which is the place of occurrence. He produced a pistol (Ex. III) from his house in circumstances which clearly showed that he only could have known of its existence there. The opinion of the firearms expert clearly established that the cartridge (Ex. I), found near the cot of Daya Ram, was fired with the pistol (Ex. III) produced by the appellant. All these circumstances, in the opinion of the High Court left no doubt that the appellant murdered Daya Ram by shooting him with his pistol.

It was next urged on behalf of the appellant, that it was impossible for a cartridge to have been near the cot of Daya Ram, because after the shot had been fired the cartridge would still remain in the barrel of the firearm. This again is pure speculation. That the cartridge was ejected from the firearm is certain. Why it was ejected, none can say. It may be that the miscreant reloaded his weapon to meet any emergency. The evidence of the sub-inspector is clear that on his arrival at the place of occurrence the cartridge Ex. 1 was handed over to him by the witness Khamani who cannot be said to be unfavourable to the appellant. The courts below had no reason to disbelieve the evidence in the case that the cartridge Ex. 1 was found near the cot of Daya Ram and we can find no extraordinary circumstance to justify as saying that the courts below took an erroneous view of the evidence.

> ***The real question is, whether it is safe to act upon the opinion of the firearms expert that the cartridge Ex. 1 was fired from the pistol Ex. III produced by the appellant and none other, because without that evidence the circumstantial evidence in the case would be insufficient to convict the appellant of the crime of murder. The opinion of the firearms expert, based on the result of his tests, does not seem to have been challenged in cross-examination or before the High Court. If there is no reason to think that there is any room for error in matters of this kind and it is safe to accept the opinion of the expert, then clearly it is established that the cartridge Ex. 1, found near the cot of Daya Ram, was fired from the pistol Ex. III produced by the appellant.***

To satisfy ourselves we have looked into the works of some authors dealing with the marks left on cartridge and shell cases by firearms in order to ascertain that there is no error in the opinion of the firearms expert in the present case. Kirk in his book *Crime Investigation* at p 346 states:

> ***Fired cases are less often encountered in criminal investigation than are bullets, but when found they are usually of greater significance because they receive at least as clear markings as do bullets, have a greater variety of such markings, and are not ordinarily damaged in firing …***
>
> ***The questions which may be asked as a result of finding such materials are similar to those that require answers when only bullets are located. In the ordinary case, quite definite answers can be given. This is true both of shotgun shells and of cartridge cases from pistols, revolvers, and rifles … In general, it is possible to identify a certain firearm as having fired a particular shell or cartridge, it is often possible to identify the type of make of gun which fired it, though in many instances this must be tentative or probable identification only.***

After dealing with the marks left by breech-block, firing pin impressions, marks from extractors and ejectors, marks due to expansion, magazine marks and loading mechanism marks, he states:

> ***Summarising, the cartridge or shell case usually carries markings which are quite distinctive of the gun in which the charge is fired, and can be used for positive identification of the latter. These marks arise from a variety of contacts with various parts of the gun, an analysis of which is useful in determining the type of weapon in case no suspected gun is available … Thus, the recovered shell or cartridge case is one of the most useful types of physical evidence which can be found in shooting cases.***

Soderman and O'Connell in their book *Modern Criminal Investigation* also deal with the subject and they refer to the marks from the firing pin, the extractor, the ejector, and the breech block. After referring to comparison being made of the cartridge or shell fired from a firearm for the purpose of test, they state at p 200:

> *If they are in the same position in relation to one another and their general appearance is the same, one may conclude that they have been fired from a pistol of the same make. An absolute conclusion about the origin of the shells, however, can be reached only after a photomicrographic examination of the markings from the breech block on the rear of the shell …*
>
> *Identification, with the aid of the enlargement, should not prove difficult. The characteristic scratch can be easily seen. A photograph of the incriminating shell and one of a comparison shell should be pasted side by side on cardboard, and the characteristic marks should be recorded with lines and ciphers, following the same method as that used in the identification of fingerprints.*

In Taylor's book on *Medical Jurisprudence*, 10th Edn., Vol 1, at p 459, it is stated:

> *It is never safe to say that a cartridge case was not fired from a given pistol unless the marks are quite different, and a case which bears no marks at all may quite well have been fired from the same pistol as one which leaves well-defined marks. In general, however, though it is unlikely that all marks will be equally good, it is usually possible to obtain definite information from the marks of the firing pin, extractor, ejector or breech-block on the base or rim or from grooves or scratches on the surface. In weapons of the same manufacture the marks are of the same general nature, but in each weapon there are individual differences which usually enable it to be definitely identified.*

The expert's evidence in this case shows that he had fired test cartridges from the pistol Ex. III. He found the individual characteristics of the chamber to have been impressed upon the test cartridge Exs. 9 and 10 and that exactly identical markings were present on the paper tube of the cartridge Ex. 1. He made photomicrographs of some of these individual marks on Exs. 1 and 10. In giving his reasons for his opinion, the firearms expert stated that every firearm has individual characteristics on its breech face, striking pin and chamber. When a cartridge is fired, gases are generated by the combustion of the powder, creating a pressure of 2 to 20 tons per square inch. Under the effect of this pressure the cap and the paper tube of the cartridge cling firmly with the breech face, striking pin and chamber and being of a softer matter the individualities of these parts are impressed upon them. By firing a number of test cartridge from a given firearm and comparing them under a microscope with the evidence cartridge, it can definitely be stated, if the marks are clear, whether the evidence cartridges had been fired or not from that firearm. It seems to us that the firearm expert made the necessary tests and was careful in what he did. There is no good reason for distrusting his opinion. The learned judges of the High Court examined the photomicrographs in question and were satisfied that there was no ground for distrusting the evidence of the expert. They were accordingly justified in coming to the conclusion that the cartridge Ex. 1, found near the cot of Daya Ram, was fired from the pistol Ex. III produced by the appellant from his house. There can, therefore, be no room for thinking, in the circumstances established in this case, that anyone else other than the appellant might have shot Daya Ram. He was, therefore, rightly convicted for the offence of murder.

The appeal is accordingly dismissed.

8.21.2 Inconclusive Evidence not Fatal[44]

The ballistic expert could not connect the two pieces of the bullet with the rifle but nonetheless he opined that a shot was fired from this rifle and the weapon was a fit one and could be utilized for firing. In these circumstances the inability of the expert to connect the two fragments of the bullet with the rifle could not be a circumstance necessarily leading to the inference that the said bullet was not shot from the rifle. Any expert may be ballistic or otherwise, can only give an opinion evidence. In a case where eye-witnesses are reliable and testify definitely to the weapon of attack any opinion of an expert even if it indicates a circumstance which does not exactly fit in prosecution story would be of no avail and can easily be ignored. [45]All the same in the instant case, the opinion of the expert cannot be stated to negative the prosecution version in any manner.

8.21.3 Unsatisfactory Report[46]

An expert opinion in firearm identification case should produce facts and not opinion which cannot be checked. Being the head of the Forensic Science Laboratory, the expert should know his responsibility towards the administration of criminal justice. He should give up the habit of producing his bald opinion. The expert should, if he expects his opinion to be accepted, put before the court all the material which induced him to come to his conclusion so that the court, although not an expert may form its own judgment on these materials. Bald opinions are of no use to the court and often lead to the breaking of very important links of prosecution evidence which are led for the purpose of corroboration.

The opinion given by Sri Prem Singh, Ballistic Expert, is bald and there is no data or reasons to arrive at the conclusion that the hole already there on the trousers of the injured could be caused by the pellet extracted from the calf of the injured. There is no opinion that the pellet extracted from the calf of the injured could be fired from the gun, Ex. 3, belonging to the appellant, nor could it be possible for the expert to give such an opinion because the gun was a muzzle-loading gun. The size of the shot recovered from the calf of the injured is . 5075". There is no evidence of the size of the shots that were fired by the expert. The shot extracted from the calf of the injured was admittedly not fired by the expert in the test firing. Thus his opinion that the hole found on the trousers of the injured could be caused by the pellet extracted from the leg of the injured cannot be accepted. This opinion cannot be called as an expert's opinion so as to corroborate the ocular evidence on record.

If the opinions of the Doctor and of the Ballistic Expert are ignored then the only evidence left is of the injured himself and of the two witnesses namely Tara Dutt Bhat (P.W. 2) and Pani Ram (P.W. 3). As has been stated above Tara Dutt Bhatt (P.W.2) is admittedly the uncle of the injured. He claims to have gone along with the injured to see she-buffalo at a nearby place and while returning this occurrence took place. But these facts are wanting in the FIR. Similarly, P.W. 3 Pani Ram has stated that the appellant was abusing him and assaulting him on the main road. The injured Hari Charan Bhatt and the witnesses Tara Dutt Bhatt who were returning after seeing she-buffalo saw this occurrence and accosted the appellant that he had become old enough to come out on the road and hurl abuses. These facts are also wanting in the FIR. These facts appear to have been introduced in the evidence simply to make the presence of Tara Dutt Bhatt and Pani Ram probable at the time of occurrence. A suggestion has also been given to Pani Ram that he was 'Halwaha' of the injured. In these circumstances the oral testimony does not repose much confidence.

---

44. *State of Himachal Pradesh v Ram Singh*, 1973 Cr LJ 150 (Simla).
45. *Jai Dev and Hari Singh v State of Punjab*, AIR 1963 SC 612 : (1963) 3 SCR 489 : (1963) 1 Cr LJ 495 (SC).
46. *Gopal Singh Gorkha v State of Uttar Pradesh*, 1991 All LJ 374 : 1991 (48) All Cri C 41 : 1991 Cr LJ 1235 (HC).

It is also noteworthy that if the prosecution version is correct, the quarrel was going on between the appellant and Pani Ram. There was no occasion for the injured Hari Chand Bhatt to intervene and to pass any remarks against the appellant. This also makes the prosecution story highly unbelievable.

Thus, a close scrutiny and analysis of the entire prosecution evidence show that some facts which were wanting in the FIR were introduced in the evidence in order to make the presence of Tara Dutt Bhatt (P.W. 2) and Pani Ram (P.W. 3) more probable. The occurrence took place in the evening on road when admittedly a large number of persons were present but none of them was examined. A great suspicion arises from the cuttings and over-writings in the injury report and Bed Head Ticket and also from the discrepancy in paras 4 and 5 of the Expert's report, Ex. Ka-2. Opinion of Ballistic Expert cannot be said to be an expert opinion and has to be discarded outright. Enemity between the injured and the appellant is admitted. In these circumstances, the possibility of false implication of the accused cannot be ruled out.

Before parting with the case it may also be pointed out that the muzzle of the gun when it was recovered from the appellant was found full of rust which was indicative of the fact that it was not used at all since long. P.W. 6 Prem Singh, the Expert, did not make any chemical analysis of the ingredients found on the walls of the muzzle of the gun. He has vaguely denied that what was found on the walls of the muzzle was rust. It is significant to note that he has stated that the residuary remains on the walls of the muzzle after the firing of test shots on analysis were found to contain lead and nitrate. This is highly misleading. Analysis of such remains after firing of test shots was not needed. It is clear that the contents found on the walls of the muzzle before firing of the test shots were not examined and so it cannot be said whether it was rust or traces of ammunition. Probability that the muzzle of the gun was full of rust at the time when it was recovered from the appellant cannot, therefore, be completely ruled out. That negatives the prosecution case that it was from the gun of the appellant that the shot in question was fired.

It has come in evidence that only one shot was fired. No pellets were found around the place of occurrence. Only one pellet entered the calf of the injured. It also seems highly improbable that the appellant would have chosen such an occasion to hit the injured when by his side in close proximity 3 or 4 other persons were also sitting.

In view of the above discussion, the prosecution has not successfully proved its case against the appellant and so the conviction of the appellant on the evidence on record cannot be sustained. The appeal must, therefore, be allowed.

8.21.4 Ballistic Expert's Vacillating Report[47]

It is well-settled law that evidence of witnesses to the occurrence cannot be thrown overboard merely because they are interested and partisan witnesses. All that the law demands is that their evidence should be scrutinised with great care and caution to safeguard against the normal temptation to falsely implicate others. The trial court had adopted that approach in evaluating the evidence of the eyewitnesses. On a critical examination of their evidence it concluded that their evidence stood corroborated by medical evidence, in that, it disclosed that Ali Mohammad had received as many as 18 injuries (13 incised wounds, 2 gunshot wounds, 2 abrasions and one contusion) whereas the deceased Siraju had sustained five injuries (four incised wounds and a swelling). The evidence of P.W. 1 also stood corroborated by the evidence of P.W. 6 Zafaruddin who wrote the FIR Ex. Ka. 3 at the behest of P.W. 1. The contents of the FIR also corroborate the testimony of P.W. 1. The find of blood, from the scene of occurrence

47. *Anvaruddin v Shakoor,* AIR 1990 SC 1242 : (1990) 3 SCC 266 : 1990 Cr LJ 1269 (SC).

noted in the *Panchnama* proved through P.W. 7. Om Prakash also lends corroboration to their testimony. It was, therefore, contended that the High Court failed to come to grips with the evidence and approached the matter in a perfunctory manner.

The deceased Ali Mohammad had, as stated earlier, suffered as many as 18 injuries. Injuries Nos. 12 and 13 are described as gunshot injuries. They read as under:

Injury No. 12:—4 circular gunshot wounds of entry three-fourth cm x three-fourth cm with abraded margins on top of nose and right side of cheek near nose in an area of 5 cm. x 5cm. No tattooing or blackening.

Injury No. 13:—One circular gun shot through and through wound of entry x exist wound three-fourth cm x three-fourth cm on right side upper lip. No tattooing or blackening.

These two injuries are undoubtedly gun-shot injuries. Dr. Mathur, who performed the post-mortem, states that these injuries could be caused if fired at from a distance of over 4 feet. There were corresponding holes in the shirt worn by the victim. The Medico-legal expert does not say that the aforesaid two injuries were possible by a single shot. However, Shri Badul Rai, the ballistic expert, opined that the said two injuries could have been caused by a single shot fired from an improvised pistol. He deposed that if the shots were fired from a short distance of 8 to 10 feet all the pellets would have entered the body *en masse* and would have caused an exit wound thereby discrediting the evidence of the three witnesses that the shots were fired from 2½ to 3 yards. The witness, however, admitted that his estimate regarding the distance from which the shot was fired was based on standard ammunition and not improvised weapons. But when cross-examined he stated that the single shot must have been fired from a country made weapon from a distance of eight feet. The fact that there was no tattooing or blackening is indicative of the fact that the shots were fired from not too short a distance. The High Court took no notice of Dr. Mathur's opinion on this behalf. The evidence of the three eye-witnesses as to the distance from which the shots were fired is a mere estimate. Even though the ballistic expert initially opined that injuries Nos. 12 and 13 could be the result of a single shot he vacillated and stated that the possibility of the said two injuries having been caused by two different shots could not be ruled out altogether. He merely stated that the greater probability was that they were the result of a single shot. In other words, the ballistic expert was not positive in his view. In this nebulous state of the evidence of the ballistic expert we are of the view that the High Court was wholly wrong in doubting the direct evidence of the three eyewitnesses on this ground. Where the expert evidence is obscure and oscillating, it is not proper to discredit the direct testimony of the eyewitnesses on such uncertain evidence. In such a situation unless the evidence of the eyewitnesses is shaken by some glaring infirmities, it would not be proper to doubt the correctness of their statements. We are, therefore, of the opinion that the High Court was wrong in its conclusion based on the vacillating evidence of the ballistic expert.[1]

8.21.5 Scientific Evidence v Eyewitness Account[48]

In other words, the position is that if we discard this part of the evidence of the eye-witnesses which has come to light for the first time in the sessions court, then according to medical evidence, the deceased would have got two gunshots whereas it was never the prosecution case that Ram Narain Singh or any other accused fired a second shot at the deceased at any time. The medical evidence, therefore, clearly falsifies the prosecution case regarding the manner in which the deceased was hit.

Even the ballistic expert on a question by the court deposed as follows:

48. *Ram Narain v State of Punjab*, AIR 1975 SC 1727 : (1975) 4 SCC 497 : 1975 Cr LJ 1500 (SC).

"In case if it is a straight fire, and if the right arm is kept just in front of the chest, then it is possible that these injuries could be caused by one single fire".

Thus, according to the ballistic expert's evidence, unless there was cogent material and reliable evidence to show that the deceased had kept his right arm in front of his chest, the deceased could not have sustained less than two injuries. The evidence of Surjit Singh and Joginder Singh of this point appears to us to be clearly an afterthought and cannot be accepted. Thus, the prosecution has not been able to explain how the deceased died by sustaining gunshot injury. Furthermore, the evidence of Dr. S.S. Walia shows that there were two gunshot injuries on Teja Singh, namely, injury No. 1 which by itself was sufficient to cause his death, and injury No. 4 which was also the result of the gunshot. The doctor has further opined in his cross-examination that both injuries Nos. 2 and 4 could have been caused from a distance of less than 4 feet and that there was blackening both in injury Nos. 4 and 2 which were on the uncovered parts of the body. The doctor further deposed that there was corresponding burning of the shirt by injuries Nos. 2, 3 and 4. If this be the position, then injury No. 4 is not at all explained. The blackening on injury No. 4 clearly indicates that this was also a gunshot injury and the ballistic expert has also testified to this effect at p 60 of the High Court paper book that in case the blackening which has been reported by the doctor in injury No. 2 and injury No. 4 were not the actual blackening due to the powder gases then it is possible that it could be from one single fire. The doctor, however, says nothing of this sort. Thus, a combined reading of the evidence of Dr. Walia, the medical expert and Mr. J.K. Sinha, ballistic expert, clearly establishes that the deceased died of two gunshot injuries and the prosecution has not been able to explain this important circumstance. For these reasons, therefore, the evidence of the two eye-witnesses Surjit Singh and Joginder Singh is wholly inconsistent with the medical evidence as also the evidence of ballistic expert and must be rejected on that ground alone, apart from other inherent improbabilities which appear in their evidence and which have already been pointed out.

Where the evidence of the witnesses for the prosecution is totally inconsistent with the medical evidence or the evidence of the ballistic expert, this is a most fundamental defect in the prosecution case and unless reasonably explained, it is sufficient to discredit the entire case.[1]

8.21.6 Unsatisfactory Report[49]

An expert opinion in firearm identification case should produce facts and not opinion which cannot be checked. Being the head of the Forensic Science Laboratory, the expert should know his responsibility towards the administration of criminal justice. He should give up the habit of producing his bald opinion. The expert should, if he expects his opinion to be accepted, put before the court all the material which induced him to come to his conclusion so that the court, although not an expert may form its own judgment on these materials. Bald opinions are of no use to the court and often lead to the breaking of very important links of prosecution evidence which are led for the purpose of corroboration.

The opinion given by Sri Prem Singh, Ballistic Expert, is bald and there is no data or reasons to arrive at the conclusion that the hole already there on the trousers of the injured could be caused by the pellet extracted from the calf of the injured. There is no opinion that the pellet extracted from the calf of the injured could be fired from the gun, Ex. 3, belonging to the appellant, nor could it be possible for the expert to give such an opinion because the gun was a muzzle-loading gun. The size of the shot recovered from the calf of the injured is .5075". There is no evidence of the size of the shots that were fired by the expert. The shot extracted from the calf of the injured was admittedly not fired by the expert in the test firing.

49. *Gopal Singh Gorkha v State of Uttar Pradesh*, 1991 All LJ 374 : 1991 (48) All Cri C 41 : 1991 Cr LJ 1235 (HC).

Thus, his opinion that the hole found on the trousers of the injured could be caused by the pellet extracted from the leg of the injured cannot be accepted. This opinion cannot be called as an expert's opinion so as to corroborate the ocular evidence on record.

If the opinions of the Doctor and of the Ballistic Expert are ignored then the only evidence left is of the injured himself and of the two witnesses namely Tara Dutt Bhat (P.W. 2) and Pani Ram (P.W. 3). As has been stated above Tara Dutt Bhatt (P.W.2) is admittedly the uncle of the injured. He claims to have gone along with the injured to see she-buffalo at a nearby place and while returning this occurrence took place. But these facts are wanting in the FIR. Similarly, P.W. 3 Pani Ram has stated that the appellant was abusing him and assaulting him on the main road. The injured Hari Charan Bhatt and the witnesses Tara Dutt Bhatt who were returning after seeing she-buffalo saw this occurrence and accosted the appellant that he had become old enough to come out on the road and hurl abuses. These facts are also wanting in the FIR. These facts appear to have been introduced in the evidence simply to make the presence of Tara Dutt Bhatt and Pani Ram probable at the time of occurrence. A suggestion has also been given to Pani Ram that he was "Halwaha" of the injured. In these circumstances the oral testimony does not repose much confidence.

It is also noteworthy that if the prosecution version is correct, the quarrel was going on between the appellant and Pani Ram. There was no occasion for the injured Hari Chand Bhatt to intervene and to pass any remarks against the appellant. This also makes the prosecution story highly unbelievable.

Thus, close scrutiny and analysis of the entire prosecution evidence show that some facts which were wanting in the FIR were introduced in the evidence in order to make the presence of Tara Dutt Bhatt (P.W. 2) and Pani Ram (P.W. 3) more probable. The occurrence took place in the evening on road when admittedly a large number of persons were present but none of them was examined. A great suspicion arises from the cuttings and over-writings in the injury report and Bed Head Ticket and also from the discrepancy in paras 4 and 5 of the Expert's report, Ex. Ka-2. Opinion of Ballistic Expert cannot be said to be an expert opinion and has to be discarded outright. Enmity between the injured and the appellant is admitted. In these circumstances, the possibility of false implication of the accused cannot be ruled out.

Before parting with the case it may also be pointed out that the muzzle of the gun when it was recovered from the appellant was found full of rust which was indicative of the fact that it was not used at all since long. P.W. 6 Prem Singh, the Expert, did not make any chemical analysis of the ingredients found on the walls of the muzzle of the gun. He has vaguely denied that what was found on the walls of the muzzle was rust. It is significant to note that he has stated that the residuary remains on the walls of the muzzle after the firing of test shots on analysis were found to contain lead and nitrate. This is highly misleading. Analysis of such remains after firing of test shots was not needed. It is clear that the contents found on the walls of the muzzle before firing of the test shots were not examined and so it cannot be said whether it was rust or traces of ammunition. Probability that the muzzle of the gun was full of rust at the time when it was recovered from the appellant cannot, therefore, be completely ruled out. That negatives the prosecution case that it was from the gun of the appellant that the shot in question was fired.

It has come in evidence that only one shot was fired. No pellets were found around the place of occurrence. Only one pellet entered the calf of the injured. It also seems highly improbable that the appellant would have chosen such an occasion to hit the injured when by his side in close proximity 3 or 4 other persons were also sitting.

In view of the above discussion, the prosecution has not successfully proved its case against the appellant and so the conviction of the appellant on the evidence on record cannot be sustained. The appeal must, therefore, be allowed.

8.21.7 Expert Evidence not Essential[50]

1. Whilst we are on this point, we may briefly indicate the nature of the prosecution case so far as the use of the guns is concerned. The appellant Gurcharan Singh had fired two shots, one of which killed Sukhjit Singh and the other Gurdial Singh. The appellant Surjit Singh had fired three shots, two at Arjan Singh and one at Piara. The evidence seems to show that Surjit Singh loaded the gun once in the presence of the witnesses and whilst so doing, he put two cartridges in the gun and the spent cartridges in his pocket. The two empties which had been sent for expert examination were found and picked up on a thoroughfare in front of the house of Jarnail Singh. Apparently, the prosecution case is that these two cartridges had been fired by the appellant Gurcharan Singh from Arjan Singh's gun picked up by him. In any event, the report shows that the two cartridges had been fired from the same gun. That is why the failure to prove the report cannot be said to have prejudiced the appellant's case at all.

Mr. Purushotam, however, argued that a ballistic expert should have been examined in order to ascertain whether the gun surrendered by Daljit Singh had been used at all. But this argument is obviously untenable for the simple reason that this gun was surrendered more than a week after the incident and it takes no imagination to realise that when Daljit Singh surrendered the gun, he must have cleaned it so as to remove any evidence about its use on the date of the incident.

It has, however, been argued that in every case where an accused person is charged with having committed the offence of murder by a lethal weapon, it is the duty of the prosecution to prove by expert evidence that it was likely or at least possible for the injuries to have been caused with the weapon with which, and in the manner in which they have been alleged to have been caused; and in support of this proposition, reliance has been placed on the decisions of this court in *Mohinder Singh v State of Punjab*[51]. In that case, this court has held that where the prosecution case was that the accused shot the deceased with a gun, but it appeared likely that the injuries on the deceased were inflicted by a rifle and there was no evidence of a duly qualified expert to prove that the injuries were caused by a gun, and the nature of the injuries was also such that the shots must have been fired by more than one person and not by one person only, and there was no evidence to show that another person also shot and the oral evidence was such which was not disinterested, the failure to examine an expert would be a serious infirmity in the prosecution case. It would be noticed that these observations were made in a case where the prosecution evidence suffered from serious infirmities and in determining the effect of these observations, it would not be fair or reasonable to forget the facts in respect of which they came to be made. These observations do not purport to lay down an inflexible rule that in every case where an accused person is charged with murder caused by a lethal weapon, the prosecution can succeed in proving the charge only if an expert is examined. It is possible to imagine cases where the direct evidence is of such an unimpeachable character and the nature of the injuries disclosed by post-mortem notes is so clearly consistent with the direct evidence that the examination of a ballistic expert may not be regarded as essential. Where the direct evidence is not satisfactory or disinterested or where the injuries are alleged to have been caused with a gun and they *prima facie* appear to have been inflicted by a rifle, undoubtedly the apparent inconsistency can be cured on the oral evidence of a ballistic expert. In what cases the examination of a ballistic expert is essential for the proof of the prosecution case, must naturally depend upon the circumstances of each case. Therefore, we do not think that Mr. Purushotam is right in contending as a general proposition that in every case where a firearm is alleged to have been used by an

50. *Jai Dev and Hari Singh v State of Punjab*, AIR 1963 SC 612 : (1963) 3 SCR 489 : (1963) 1 Cr LJ 495 (SC).
51. AIR 1953 SC 415 : 1953 Cr LJ 1761 (SC).

accused person, in addition to the direct evidence, prosecution must lead the evidence of a ballistic expert, however, good the direct evidence may be and though on the record there may be no reason to doubt the said direct evidence.[1]

2. The last argument which Mr. Anthony has urged before us is that the prosecution should have examined a ballistic expert in this case and since no expert has been examined, it cannot be said that the prosecution has proved its case that the appellants caused the deaths of the two victims by shooting from the rifles which they carried. In support of this argument, Mr. Anthony has referred us to the decision of this Court in *Mohinder Singh v State of Punja.*[52]

Now, the story about the recovery of this revolver is very interesting. According to the defence, Amin Lal was carrying a revolver and when he was hit with a lathi by Sajjan Singh, the revolver fell down from his hands and Yudhbir Singh picked it up and fired it at Amin Lal. Now this revolver was carried away by Yudhbir Singh to his house and said that he produced the same before the police investigation officer. On the other hand, according to Gurbux Singh, it was the accused Sajjan Singh who after his arrest produced the pistol and two live cartridges before him. It would thus appear that the revolver had been produced by one of the accused persons on the allegation that it was carried by Amin Lal and had been used by Yudhbir Singh in self-defence after it had fallen down from Amin Lal's hands. It has not been the prosecution case that it is this revolver which had been used by Yudhbir Singh. It may well be that the revolver has been deliberately surrendered by the accused in order to introduce complications in the case. We think, in such a case it is difficult to understand for what purpose the prosecution was expected to examine the expert. Therefore, in our opinion, the decision in the case of *Mohinder Singh*,[53] has no application to the case before us.

8.21.8 Photographs not Indispensable[54]

The evidence of P.W. 26 is also attacked by the defence on the ground that he has not taken the microscopic photographs of the pin marks of the cartridges and furnished the other data of the microscopic findings shown by the diagrams to satisfy the court that the characteristic pin marks of the cartridges M.O. 15 recovered in this case are found to be identical with that of the test fired cartridges. In the case of *Ramanathan v State of Tamil Nadu,* 1978 Cri LR (SC) 318 : 1978 Cr LJ 1137 : AIR 1978 SC 120, it is held by the Supreme Court as follows:

> *It is true that there has been considerable difference of opinion amongst the investigators regarding the use of photographs in a court for the purpose of illustrating the matching of the markings and while it may be that microscopic photograph, when taken with due care and in the best of conditions, may enable the evidence to be placed on the record in a visible form, it cannot be denied that a court would not be justified in rejecting the opinion of an expert who has examined the markings under the comparison microscope simply for the reason that he has not thought it necessary to take the photographs.*

In view of this law laid down by the Supreme Court, the evidence of P.W. 26 cannot be rejected merely on the ground that he has not taken the photographs of the cartridges concerned. He has also explained that he could not take the photographs for want of films.

---

52. *Ibid.*

8.21.9 Linking Evidence[55]

There are certain other factors to which our attention has been drawn by the learned counsel. His submission is that the prosecution also rested its case on the fact that the cartridge which had been found and taken over by the investigating officer had been fired by the gun of the appellant. There is no controversy that 10 cartridges had been sold to the appellant at Varanasi, as it has also been admitted by the appellant himself in his statement under section 342 of the Cr PC The seller of the cartridge, namely Santosh Kumar Mukherjee, has been examined in the case and he has proved the original cash memo which he had given to the appellant which has been marked Exhibit 2. He had also brought the carbon copy of the cash memo. He also proved the sale voucher, which is Exhibit 3, and also the signature of the appellant thereon which were marked Exhibit three-first. Learned counsel urged that the gun and the cartridge had been sent to the arms expert, who has been examined as P.W. 6 in the case. His evidence was required to determine whether the cartridge which had been seized was used in the gun produced by the appellant or not is that on 25 July 1966 he had received a double barrel gun along with one fired cartridge case. He found the left barrel of the gun coated with a quantity of fouling, indicating that it was fired previously, and the gun was in perfect working condition. With the said gun he fired two cartridges and compared the three fired cartridges under comparison microscope and found similar striker and breech face markings on the percussion caps of the fired cartridges. He proved his report which was marked Exhibit 5, and explained that next to balls, L.G. shots were the biggest, having 6 shots in each 2½" cartridge.

8.21.10 *Bona Fide* of Expert[56]

Mr. Prasad's contention is that it has not been established in the case that P.W. 6 was entitled to claim that he was an expert so that his evidence could be made admissible. The prosecution had not asked any question so as to indicate that he had sufficient training, knowledge and experience as to justify him to be called an expert and, as such, it is urged that his opinion could not be the last word on the subject. This part of the submission cannot be accepted, because no challenge was made in cross-examination. Besides, it is for the court to decide the question of competency or fitness of a witness who claims to be an expert. In this case I am satisfied that the learned judge before whom P.W. 6 was examined appears to have been satisfied that he was firearm expert under government of Bihar, therefore, his competency cannot be now questioned at this stage.

The next question that, however, still remains to be determined is the value of the evidence of P.W. 6. Learned counsel has contended that the record does not furnish the materials which had helped the expert in coming to his conclusion as he has done in this case and the court has not the advantage of looking into those materials so as to hold that the expert was justified in the opinion that he has given. Besides, it is said other materials have not been produced and as such, there can be no guarantee that the expert had either examined the gun and the cartridge with the help of those materials at all. If, on the other hand, he had so done, whether his conclusions had been rightly arrived at.[1]

8.21.11 Inordinate Delay[57]

It is significant to note this connection that the gun and the cartridge had been received by P.W. 6 on 25 July 1966, but his examination was not completed until 13 May 1967. He

55. *State of Bihar v Hanuman Koeri*, 1971 Cr LJ 187 (Pat).
56. *Ibid.*
57. *Ibid.*

even admitted in his cross-examination that he might have commenced the examination a day or two earlier, though he did not remember the exact date of the commencement of the examination. This inordinate delay in the examination of the ballistic expert is to be deplored and it is unfortunate that in such serious cases, the expert does not attach sufficient importance for speedy examination and submission of his report. I might also mention that the occurrence in the present case having taken place between the 5th and 6 July 1966, the charge-sheet could not be submitted until 25 July 1967, and the expert (P.W. 6) is largely to be blamed for this delay. It is to be hoped that the attention of the authorities concerned and particularly of firearms expert (P.W. 6) will be drawn to these observations so that thereafter there may not be such deplorable delay in such matters.

8.21.12 Inadequate Evidence[58]

No doubt, the gun has been recovered from the house of the accused, as stated by P.Ws. 6, 7 and 9. This gun was sent to the ballistic expert. But the pellets recovered were not sent to him. It has been mentioned in the report of the ballistic expert:

> *"It is not possible to say when the gun was last used for firing as final products of residue have already been formed".*

There is also no other evidence to show that the shot was fired from this particular gun. So without any convincing evidence that the gun was used by the accused, mere recovery of the gun will not in any way help the prosecution.

8.21.13 Data[59]

Coming back to the submission of learned counsel on the evidence of P.W. 6, I think that the submission must be accepted as correct. It also finds support from a decision of the Supreme Court in *Kalua v State of Uttar Pradesh*.[2] In *Kalua's* case, the accused was convicted for the murder of the deceased by shooting him with an improvised (improvised) pistol. A cartridge was found near the cot of the deceased, and the accused was arrested fourteen miles away from his village which was the place of occurrence. He produced a pistol from his house in circumstances which clearly showed that he only could have known of its existence there. The evidence of the firearm expert showed that he had fired four test cartridges from the pistol produced by the accused. He found the individual characteristics of the chamber to have been impressed upon the test cartridges and that exactly identical markings were present on the paper tube of the evidence cartridge. He made photomicrographs of some of these individual marks on the test cartridges and the evidence cartridge, and gave his opinion that the cartridge found near the cot of the deceased was fired from the pistol produced by the accused. The High Court held, which was approved by the Supreme Court, that the firearms expert has made the necessary tests, he appeared to have been careful in what he did. There was no good reason for distrusting his opinion. It would, therefore, appear that in the said case all the materials which had helped the firearm expert in coming to his conclusion were produced in the trial court and the High Court had the advantage of considering those matters and was satisfied that the firearms expert had carefully made the necessary tests. In the instant case, no material has been furnished and, therefore, we are unable to hold whether or not the firearms expert, namely, P.W. 6 had been careful in carrying out the necessary tests before giving his opinion as contained in the report and testified to the court. This is a serious infirmity in the prosecution case. The learned standing counsel had, however, urged that since P.W. 6 was not crossed-examined on these matters, it must be assumed that the method of examination by

58. *Ibid.*
59. *Ibid.*

the expert of the gun and the cartridge was no longer open to doubt. There is no justification for this argument, because the prosecution is under duty to produce every scrap of material which would help in coming to a just decision in the case, irrespective of the fact whether those materials go against the prosecution or in its favour.

8.21.14 Contradictory Evidence[60]

The appellant, who had a rifle with him shot at Labh Singh from behind his back as he was attempting to run away. Labh Singh died on the spot. The small intestines were torn up and the left kidney was found smashed. The circular wound of entry at the back of the deceased one-fourth" in diameter, had burnt and inverted margins according to the doctor who conducted the post-mortem examination. The ballistic expert deposed that if there were burnt edges of the wound, the distance between the muzzle and the victim would only be a few inches and not more than nine inches. This opinion is in substantial accord with what is found in some of the textbooks on medical jurisprudence. For instance, it is stated in *Taylor's Principles and Practice of Medical Jurisprudence*, Vol I, 10th Edn., at p 441, under the heading "Burning of the Wound":

It is impossible to state rules as to the precise distance from which it is impossible to produce marks of burning, for this depends on the quantity and nature of the power, the method of charging, and the nature of the weapon. It is unusual, however, to get marks of burning beyond a yard or a yard and a half with a shotgun, or at more than half a yard with a revolver.

According to the medical evidence, therefore, the shot was fired from very close range about 9 inches to a yard or a yard and a half but according to what was shown to the draftsman of the plan by the eye-witnesses the rifle was fired from a range of about 25 feet. This difficulty cannot be surmounted, as was sought to be done by the High Court, as the eye-witnesses were not giving an estimate of the distance but showed to the draftsman the particular spots where the appellant and the deceased stood at the time of firing. Thus, in the face of the medical evidence, the testimony of the eye-witnesses cannot be safely accepted.[1]

8.21.15 Number of Firearms[61]

1. Neither the genuineness of the recoveries of the empties from the roof of the house of Bhag Singh nor the recovery of gun Ex. P. 12 from the person of Bhag Singh at the time he was apprehended has been challenged on behalf of the defence nor the correctness of the opinion given by the ballistic expert has been challenged on its behalf. It has, however, been urged by Shri Dara Singh, counsel for the appellants that according to the statement given by Shri J.K. Sinha, Assistant Director, Forensic Science Laboratory, Chandigarh P.W. 20, who examined and tested the three empty cartridges, Ex. P 13/1.3 recovered from the roof of the house of Bhag Singh appellant, they were fired from gun, Ex. P. 12 used by Bhag Singh appellant and that no empty cartridge has been recovered used in the gun, with which Mehar Singh appellant was armed and with which, according to the evidence of the eye-witnesses, he fired one shot at Basant Singh deceased. The question of recovery of empty cartridge dropped from the gun of Mehar Singh appellant will arise only, if there is evidence to show that after Mehar Singh fired his shot at Basant Singh, deceased, he emptied his gun. It is nowhere stated by any of the eye-witnesses, and no such question was asked from them in course of their cross-examination, that after Mehar Singh had fired his shot he emptied the gun.

8.21.16 Number of Shots from Injuries[62]

The learned counsel further contends that it was doubtful that 12 rounds would have been fired. He points out the number of injuries received by the villagers. But these injuries support the prosecution story. From the injuries on the various persons examined by Dwarka Nath Prasad, P.W. 41, apart from the persons who had died and whose bodies had been held to have been cremated by unidentified persons, it appears that 20 persons had received gunshot injuries; one of them had as many as 14 lacerated wounds and another had 10 lacerated wounds. Apart from that there is no reason to doubt the oral evidence given in this case that a number of rounds were fired.

8.21.17 Illusory Discrepancy[63]

The only point, which has been canvassed seriously before us by Mr. Umrigar who appeared in support of the appeal, is that the story put forward by the prosecution, namely that Thanni was killed by a pistol shot fired by Nawab Singh is materially contradicted by the medical report and the evidence of some of the prosecution witnesses. It is pointed out that the medical report shows that there were a number of gunshot wounds in the body of the victim and in Ex. P-6 it is clearly stated that an empty 12 bore cartridge was recovered from where the body of the victim lay. It is argued that in these circumstances the prosecution story, that Thanni was killed by a pistol shot fired by Nawab Singh cannot possibly stand; and in cases like this where death is due to injuries or wounds caused by a lethal weapon, it is incumbent upon the prosecution to prove by expert evidence, if necessary, that it was likely or at least possible for the injuries to have been caused with a weapon with which they were alleged to have been caused.

The point, it may be noted, was not raised before the High Court either during the hearing of the appeal or even at the time when the appellant applied for leave to appeal to this court. It seems to us that the point is without substance and the apparent discrepancy upon which the learned counsel lays stress appears on close examination to be wholly illusory. The prosecution story undoubtedly is that Nawab Singh carried a pistol with which he fired at Thanni. The pistol, however, was country made one and P.W. 6 expressly states that 12 bore cartridges could be fired in such pistols.

This story was accepted by the additional sessions judge and there is nothing improbable, therefore, in the recovery of a 12 bore exploded cartridge being found near the body of the victim, or in the presence of multiple injuries in his body. It is not the case of the prosecution that only one shot was fired by Nawab Singh. It may be further mentioned that the expression gun fire was used in the ordinary and colloquial sense by the prosecution witness and the evidence clearly indicates that they did not mean that the shot was fired from a gun and not from a pistol. The contention of the learned counsel must, therefore, fail.

8.21.18 Number of Murderers and the Murdered[64]

As a mere proposition of law, it would be difficult to accept the argument that the sentence of death can be legitimately imposed only where an accused person is found to have committed the murder himself. Whether or not sentences of death should be imposed on persons who are found to be guilty not because they themselves committed the murder, but because they were members of an unlawful assembly and the offence of murder was committed by one

62. *Ram Prasad Sharma v State of Bihar*, AIR 1970 SC 326 : (1970) 1 SCR 694 : 1970 Cr LJ 496.
63. *Nawab Singh v State of Uttar Pradesh*, AIR 1954 SC 278 : 1954 Cr LJ 738 (SC).
64. *Masalti v State of Uttar Pradesh*, AIR 1965 SC 202 : (1965) 1 Cr LJ 226 : 1965 (1) SCJ 605.

or more of the members of such an assembly in pursuance of the common object of that assembly, is a matter which has to be decided on the facts and circumstances of each case. In the present case, it is clear that whole group of persons belonged to Laxmi Prasad's faction, joined together armed with deadly weapons and they were inspired by the common object of exterminating the male member in the family of Gayadin. Ten of these persons were armed with firearms and the others with several other deadly weapons, and evidence shows that five murders by shooting were committed by the members of this unlawful assembly. The conduct of the members of the unlawful assembly both before and after the commission of the offence has been considered by the courts below and it has been held that in order to suppress such fantastic criminal conduct on the part of villagers it is necessary to impose the sentences of death on 10 members of the unlawful assembly who were armed with firearms. It cannot be said that discretion in the matter has been improperly exercised either by the trial court or by the High Court. Therefore, I see no reason to accept the argument urged by Mr. Sawhney that the test adopted by the High Court in dealing with the question of sentence is mechanical and unreasonable.

8.21.19 Missed Cartridge as Evidence[65]

The cartridges were sent to the Forensic Science Laboratory. There is the evidence of Mr. J.K. Sinha and his report is marked Exhibit P-21. He said that two sealed parcels were received in the laboratory on 12 May 1969. One of the sealed parcels contained one .303 bore rifle marked 'A' by him. That is the rifle received from the appellant. The second sealed parcel contained two .303 fired crime cartridge cases and one .303 missed cartridge. His evidence was that the two fired crime cartridges had been fired through the .303 rifle. His opinion about the missed cartridges was that the firing pin impression on the missed cartridge tallied with the firing pin impression on the .303 rifle marked "A". He examined the two fired test cartridges. He also examined the test cartridges under a comparison microscope for individual characteristic markings present on them. He compared the same with individual characteristic markings present on the fired or crime cartridges. On comparison, he found that the firing pin marks present on the test cartridges tallied with the firing pin marks present on the crime cartridges in their individual characteristics. Dr. Sinha said that the fired cartridges were fired through the rifle marked "A" and could not have been fired from any other rifle even of the same make and bore because every firing pin has its own individuality. He took photomicrograph which showed some of the similar individual characteristics.

The rifle was under a sealed cover. It was opened in this court. The magazine chamber was found to have the same number as in the report Exhibit P-10. The submission on behalf of the appellant that there was a difference between the number of the rifle in the magazine chamber and in the report was, therefore, not acceptable.

The entire evidence was rightly believed by the High Court. The High Court then correctly confirmed the capital sentence. The appeal fails and is dismissed.

8.21.20 Wads as Evidence[66]

We have a vague indication that these two jointly, or one of them, might have had something to do with the killing of Khandiya because the corpse was found just outside their house and the killing was with a muzzle-loading gun and Chima has a muzzle-loading gun and further, though these points are not so definite, the wadding found in one of the gunshot wounds in the corpse was similar to the wadding found in Chima's house, and the gun itself had signs

65. *Mukhtiar Singh v State of Punjab*, AIR 1971 SC 1864 : 1971 Cr LJ 1298 (SC) : 1971 UJ (SC) 582.
66. *Chima Mahariya v State of Madhya Pradesh*, 1969 Jab LJ 525 : 1969 MPLJ 524 : 1969 Cr LJ 1291 (MP).

of having been used sometime before the examination. The problem then is whether this is sufficient, and if so, whether they were acting with a common intention, or, which comes to the same thing, each abetting the other, and if each was acting independently which of the two it was. In the absence of common intention, the evidence has to be led pointing to one out of the two because the shooting of the gun was a one-man job whoever it was.

The result is that apart from the statements attributed to either of the accused persons there is really no evidence against either jointly or individually. Something like a circumstance is found in the fact that a muzzle-loading gun had been used; but even that is not very illuminative because it has not been brought out that Chima is the only owner of a muzzle-loading gun in that village. Wadding of the type found in one of the wounds and also in Chima's house is of a common variety; but assuming that Chima Bhilal's gun had been used and then put on the dung heap, that by itself while creating suspicion may not point to one or the other definitely as the offender. One of the two might have used it. Each of them had at different stages been anxious to take the blame on himself or herself and spare the other and each indicated that they were justified in shooting Khandiya. If there was any other evidence we could pin the responsibility on one of the two definitely or even make out common intention; but we have nothing. Thus, it would be a case of no common intention and uncertainty to which of the two had shot. Further, if one takes into account the recorded statement of the woman, then again it would be a case of justification in self-defence as the person killed was trying to abduct her with the intention of compelling her to sexual intercourse. If we reject that statement, nothing is left. The only conclusion a court can arrive at is that it is a fit case for the benefit of doubt to both the appellants.

8.21.21 Firearm Evidence[67]

The reasons 4, 5 and 7 mentioned above from the trial court judgment may be taken up together. Either there was delay in giving information to the police or unexplained delay in the various steps taken by sub-inspector Sis Ram. The police station was at a distance of about 3 kilometres from the hospital. It does not stand to reason that the Ruka sent by the doctor took more than two hours to reach the sub-inspector at the police station and that the latter took an hour and a half in reaching the hospital after receipt of the Ruka. The copy of the First Information Report was received by the Illaka Magistrate at 7.30 am in the morning. Although there was no evidence in support of the suggestions thrown on the side of the respondent, the possibility of the suggestions being true could not be ruled out. Viewed in the background of the very suspicious story of the apprehension of the respondent on the 2 March 1970 at Agroha turning the story of snatching the fore-end of the gun by Manphool becomes very doubtful. From the evidence it is not clear how far this Agroha turning is from village Kajla. But Jagdish, P.W. 10, it is interesting to find, happened to be at Agroha turning just by chance although he is a resident of a village 20 miles away from there. He is also related to the deceased. He was a witness to the seizure of the gun from the person of the respondent at Agroha turning. His evidence was too crude on its face to inspire any confidence as to the arrest of the respondent at Agroha turning with the Phattiless gun. The High Court, in our opinion, has wrongly accepted this evidence as against its rejection by the trial court. It is strange that Sis Ram could find the respondent present at the Agroha turning just by chance and P.W. 10 also a ready witness by chance. In this background the suggestion on behalf of the respondent that his licensed gun was taken away from his house soon after the occurrence in the same night although not proved by any evidence, does cast doubt on the prosecution story as to the manner of Manphool's catching hold of the Phatti. P.Ws. 4 and 5 are also licensed gun holders. If the story of separation of the Phatti

67. *Bahal Singh v State of Haryana*, AIR 1976 SC 2032 : (1976) 3 SCC 564 : 1976 Cr LJ 1568.

on Manphool's pouncing upon the respondent was correct, the three persons present at the scene of occurrence, if at all they were present, could have succeeded in catching the respondent with his gun. It was a single barrel gun and after one shot was fired it could not be reloaded on the detachment of its fore-end. There would have been, therefore, no fear or risk in the witnesses pursuing and apprehending the respondent with his gun at or near the place of occurrence. There are houses of persons around the scene of occurrence. The occurrence is said to have taken place at about sunset time. There must have been present independent persons in the village to watch the occurrence if it did take place in the manner alleged. But there was no such witness coming forward. The High Court remarked that some persons came immediately after the occurrence. But none of them was examined to say whether any of the three eye-witnesses was present at the scene of occurrence or any of them told the persons who arrived there the name of the respondent as being the assailant of the deceased.

8.21.22 Location and Recovery of Projectiles through X-rays[68]

We cannot part with this case without making reference to certain defect in the investigation and in the conduct of the doctor (P.W. 64) who held the post-mortem examination on the dead body of Prawakar. According to the post-mortem report there were gunshot wounds. The entrance wound was noticeable but not the exit wound. It was the duty of the Medico-legal expert (P.W. 64) to have directed X-ray examination of the dead body to determine if bullets were located in the body. It was the duty of the I.O. to see if bullets were inside the dead body and if those bullets, if recovered, were proved by ballistic examination to have been shot from the revolver (M.O. XXXVI) which admittedly belonged to Srinivas and from whose possession it was recovered. We cannot disabuse our mind of the impression that this omission cannot but be deliberate. The matter was so patent that no investigating officer would ignore it.

8.21.23 Non-Recovery of Projectiles[69]

The medical evidence disclosed that Shiv Singh, the deceased, had three gunshot wounds in his body, all in front; two on the chest and one in the stomach. All the three wounds were on the left side of the front of the body. The doctor said that any one of the three injuries would have proved fatal in itself and that all the three wounds could be caused by a single discharge from a gun.

Unfortunately, none of the shots or the bullets have been recovered. If they had been recovered, it would have been easy to determine whether they were fired from one gun or two. One of the guns alleged to have been used was a breech-loading double barrel gun with hammer action. The other was an old-fashioned muzzle-loader. Presumably, the type of shot used in the more modern weapon would have been different from the crude pellets or slugs one would expect in a muzzle-loader. Appellant *B* had admitted his guilt from the start and has taken all the blame on himself. Appellant *A*, on the other hand, has denied throughout that he has taken any part in the shooting though he admitted he was present at the scene with a gun in his hand too. The fact on which everyone is agreed is that two shots were fired. But the question is whether *B* fired both as he said or whether he fired one and *A* fired the other. The medical evidence does not disprove the defence version. The doctor said one shot could have caused all the three wounds. If one, then of course two could equally have caused three wounds and those two shots could have been fired by one person. The post-mortem examination does

68. *State of Orissa v Ram Chandra Bhoi*, AIR 1965 Ori 175 : (1965) 2 Cr LJ 520.
69. *Hate Singh Bhagat Singh v State of Madhya Bharat*, AIR 1953 SC 468 : 1953 Cr LJ 1933 (SC) : 1952 MBLR (Cri) 1.

not prove the contrary. The unfortunate omission to recover the shots or slugs in the body has deprived the court of evidence which might have been of great value on this point. The defence version was that *B* had the double barrel gun and that he fired two shots from it. *A* did not use his gun which according to the defence, was the old-fashioned single barrel muzzle-loader. Therefore, in the absence of any reloading the double barrel gun would have both barrels barren of live rounds and would be found in an unloaded condition. The muzzle loader, unless it was already empty, would still be loaded. Now, it has been accepted throughout that the muzzle-loader was found loaded when it was seized. The question is about the double barrel gun. One of the witnesses to the seizure admitted that only one gun was found loaded though he could not remember which one. There is no reason why his admission should be brushed aside. It accords with the defence version in a very material and important particular. The appeal of *A* is allowed.

8.21.24 Safe Custody and Genuine Recovery[70]

1. After having been taken through the evidence on record, we have no doubt regarding the complicity of Paramjit Singh and Gurdev Singh. Paramjit Singh, according to the testimony of the eye-witnesses, was armed with a rifle and Gurdev Singh with a gun. Paramjit Singh in his statement before the committing magistrate admitted that he had a rifle, but, according to him, he had already sold that away. Gurdev Singh undoubtedly owned licensed gun P-2. According to the evidence of Dr. Ajit Singh who performed post-mortem examination on the body of Sukhdev Singh, Sukhdev Singh had a number of bullet injuries. Sukhdev Singh had also a number of injuries caused by gunshots. The evidence of the eye-witnesses with regard to the part played by Paramjit Singh and Gurudev Singh is thus in conformity with the medical evidence. Although Paramjit Singh played the leading part in the assault on the two deceased persons, his rifle could not be recovered as he absconded after the occurrence and remained absconding for a period of more than eight months till his arrest on 11 April 1972. Gurdev Singh surrendered himself in the court of judicial magistrate Sunam on 17 August 1971. It is in the testimony of Shri J.K. Sinha, Assistant Director, Forensic Science Laboratory that three of the crime cartridges which were received in the laboratory on 11 August 1971 has been fired from licensed gun P-2 of Gurdev Singh. According to the evidence of sub-inspector Ajit Singh (P.W. 19) and Mann Dass (P.W. 4) gun P-2 was recovered in pursuance of the disclosure statement of Gurdev Singh subsequent to his surrender in court. There is no material to warrant the inference that gun P-2 was secured by the police before Gurdev Singh surrendered in court on 17 August 1971. ASI Amrik Singh (P.W. 20) has deposed that he recovered a number of empty cartridges from the place of occurrence. Out of those empty cartridges, three were found by Shri Sinha to have been fired from gun P-2 of Gurdev Singh. There could, in our opinion, be hardly any doubt on the point that the three cartridges fired from the gun of Gurdev Singh were found at the spot because those empty cartridges were sent to the ballistics expert long before the arrest of Gurdev Singh and the recovery of his gun. It is significant that gun P-2 of Gurdev Singh is his licensed gun. No question of foisting a licensed gun upon Gurdev Singh could possibly arise in the very nature of things. It was also not possible to falsely show the recovery of three empty cartridges which had been fired from that gun because at the time those three empty cartridges were sent to the Forensic Science Laboratory, the police were not in possession of gun P-2 of Gurdev Singh. The despatch of the three empty cartridges which had been fired from the licensed gun P-2 of Gurdev Singh lends assurance to the evidence about recovery of those cartridges from the place of occurrence. The fact that three of the cartridges fired from the gun of Gurdev Singh were found at the place of occurrence goes a long way to corroborate the testimony of the three eye-witnesses regarding the complicity of Gurdev Singh.

70. *Nachhittar Singh v State of Punjab*, AIR 1975 SC 118 : (1975) 3 SCC 266 : 1975 Cr LJ 66 (SC).

8.21.25 Proof of Motive not Indispensable[71]

Be that as it may, the failure of the prosecution to establish the motive for the crime does not mean that the entire prosecution case has to be thrown over-board. It only casts a duty on the court to scrutinize the other evidence, particularly of the eye-witnesses, with greater care. The High Court was fully conscious of the need for such caution, and rightly observed:

The absence of proof of motive has this effect only that the other evidence bearing on the guilt of the accused has to be very carefully examined.

Indeed, the High Court did so. The conviction of the appellant mainly rests on the evidence of Bhagwan Kaur, P.W. 2, which had been corroborated in material particulars by independent evidence, including that of the ballistic expert, Mr. J.K. Sinha.

* * * * *

Then, there was the testimony of Mr. J.K. Sinha, ballistic expert who after examination of the empties (which were found at the scene of the murder on the 18th December) and the licensed gun of the appellant, opined that those empties had been fired through the barrel of this gun.

Mr. Singh, however, contends that no empty cartridges had, in fact, been found at the spot, and that this circumstantial evidence had been fabricated after the arrest of the appellant and seizure of the gun which took place on the 19th December.

* * * * *

The courts below have for cogent reasons rejected the defence contention and accepted the prosecution version that the appellant was taken into custody along with his gun, on the 24th December. We find no fault with that reasoning. The gun having been seized by the police on the 24th, there was no scope for fabrication, nor any ground for doubting the genuineness of the empties picked up from the scene on the 18th December, and which on the 24th December were no longer in the possession or control of the investigating officer. They were as deposed to by Shri J.K. Sinha, P.W. 12, in the possession of the Forensic Laboratory since the 21st December.

The testimony of Shri J.K. Sinha had not been seriously challenged in cross-examination. In his opinion the crime cartridges had been fired from the gun of the appellant. Thus the ballistic evidence confirmed the connection of the appellant with the crime.

8.21.26 Critical Appraisal of Identification Evidence[72]

In regard to Balak Ram, there is a concurrent finding that the shot fired by him caused the death of Radhey and we see no reason for taking a different view. The evidence in regard to the part played by him is natural and consistent and is corroborated by the opinion of the ballistic expert. Such corroboration was lacking as against others. The evidence of the ballistic expert shows that the bullet (Ex. 27) which was extracted from Radhey's body was fired from the pistol (Ex. 5) belonging to Balak Ram. Mr. Anthony made a severe attack on the evidence of the expert and in order to show infirmities in that evidence he read out to us various passages from *the identification of firearms and forensic ballistic by Major Gerald Burrard; J.S. Hatcher's Test Book of Firearms Investigation, Identification and Evidence* (5th Edn., 1946) and *Modi's Medical Jurisprudence and Toxicology*. We have considered these submissions but are unable to see a reason strong enough to justify a reversal of the

71. *Nachhittar Singh v State of Punjab*, AIR 1975 SC 118 : (1975) 3 SCC 266 : 1975 Cr LJ 66 (SC).
72. *Balak Ram v State of Uttar Pradesh*, AIR 1974 SC 2165 : 1974 Cr LJ 1486.

concurrent view taken by the two courts. The normal rule that this court does not reappraise evidence in such cases must apply.

Stated briefly, Mr. Anthony's contention is that the bullet (Ex. 25) which was recovered from the scene of offence must have been the one which after hitting Tribeni Sahai made an exit wound and since that bullet, according to the ballistic expert, could not have been fired from Balak Ram's pistol (Ex. 5), he cannot be held guilty for causing the death of Tribeni Sahai, Mr. Anthony says that the evidence of the eye-witnesses stands falsified by the evidence of the expert. The difficulty in accepting this connection is that there is no warrant for saying that the bullet Ex. 25 must be the one which passed through Tribeni Sahai's body.

Mr. Anthony spent considerable time in showing that the striations on the bullet (Ex. 27) which was extracted from Radhey's body are of a different pattern from the striations on the test bullets fired from Balak Ram's pistol. The evidence of the expert has been closely considered by the High Court and we consider their finding on this aspect as open to no exception.

8.21.27 Range of Fire[73]

Ballistic Expert (P.W. 12) has opined in his report (Ex. P-12) that judging from the area of dispersion of the pellet holes on the shirt and body of the deceased, the gun must have been fired from a distance of 10 to 15 yards. He has further stated in the report that if the gun had been fired from a distance of 8 to 10 feet, as contended by the accused, some type of blackening would have been present on the shirt; but he did not find any blackening on the shirt (article-E), which the deceased was wearing. In his report as well as in his testimony, P.W. 12 has expressed the opinion that the distance from which the shot was fired at the deceased would not be less than 10 to 15 yards. In spite of elaborate cross-examination, nothing whatever has been brought out to discredit the testimony of this witness or to doubt the soundness of the opinion expressed by him. It is, no doubt, true that Dr. Gurjar (P.W. 2) has stated in his evidence that he had found burn-marks at five places on the shirt of the deceased and that in view thereof, he was of the opinion that the distance between the assailant and the victim, at the time when the gun was fired, was not more than 10 feet. Significantly, no mention whatever has been made by P.W. 2 in the post-mortem report that there were any burn-marks or charring marks on the body of the deceased at the places of entry of the pellets. Nowhere, in the course of his observations concerning the external appearance of the body of the deceased, do we find any mention by the Medico-legal expert of burn-marks. It is only in the concluding portion of the post-mortem report, under the heading "remarks regarding articles sent for examination along with the dead body" that there is a description of the shirt of the accused, as having been burnt in about five places. The said shirt which the deceased had been wearing at the time of the occurrence had been forwarded to the Ballistic Expert also, and after examining it P.W. 12 has clearly stated in the report (Ex. p 12) as follows:

> *Shirts-1 having bloodstains and 5 holes on the front left side (three of big size and two of small size). There is no blackening present around the holes.*

P.W. 12 has confirmed the truth of this observation in the oral testimony given in court. We, are satisfied that the adverse comments made by the High Court against the conduct of the Medico-legal expert (P.W. 2) are fully justified. In our opinion, the High Court acted rightly in disbelieving the evidence given by P.W. 2 on this aspect and accepting as true the observations made by P.W. 12 in his report (Ex. p 12). The expert opinion given by him in the said report as well as in his oral testimony was rightly relied on by the High Court.[1]

73. *Kishore v State of Orissa*, AIR 1967 Ori 121 : 1967 Cr LJ 1155 (HC).

On one material point range of firing of the gunshots which killed the deceased, the questions arise: From what distance the gunshots – which killed the deceased – were fired? Is the evidence consistent with the prosecution case of the gunshots having been fired from the wall of Kamraj's house which is at a distance of 38 feet? The medical evidence of the doctor P.W. 8 who held the post-mortem examination finding that there were as many as five gunshot wounds on the deceased all over the body – left lateral side of the forehead, left side abdomen lateral, left shoulder joint, upper third of the lateral side of the left arm, middle third of the right arm – is indicative of the wide dispersion of the pellets purporting to fix the distance from which the gunshots were fired.

In this context the evidence of the investigating officer P.W. 12 furnishes useful materials to fix the distance of the fatal gunshot firing. He found two pieces of lead were lying on the outer verandah of the deceased close to the wall; one lead piece was stained with lime and the other with green colour, which is wood paint, as it appeared to him, the wooden frame of the Jaffrey put on the verandah of the deceased was white washed with lime; M.Os. III and IV were the two pieces of lead, the two pieces of wads M.Os. VIII and IX were lying on the step to the outer verandah of the deceased; M.Os. III and VIII and IX were sealed in the presence of witnesses under the seizure list Ext. 24. The investigating officer also found three pieces of lead M.Os. V, VI and VII lying on the outer verandah of the house of P.W. 10, Pravakar and close to the wall on the verandah, a piece of was M.O. X was lying on the step to the outer verandah of P.W. 10, Pravakar; M.Os. V, VI, VII and X were seized in the presence of witnesses under the seizure list Ext. 25. The investigating officer also found a small hole in the bottom part of the wooden frame of the Jaffrey put on the verandah of the deceased; cut and seized that part of the wooden frame which is M.O. XXII. Further he found two small holes on the outer side of the wall of the deceased that stands on the outer verandah; similarly he found two small holes on the wooden frame of the Jaffrey put on the verandah of P.W. 10, Pravakar standing on his outer verandah. These small holes on wooden frames and on the walls indicate marks of violence by gunshots. The investigating officer cut and seized bottom parts of the wooden frame of the Jaffrey of P.W. 10, Pravakar containing the hole and these are M.Os. XX and XXI, he seized the cut pieces of wood M.Os. XI, XII and XIII in the presence of the witnesses under the seizure list Ext. 26.

The significance of all these seizures made by the investigating officer read with the medical evidence of five gunshot wounds on different parts of the body is that it shows that fatal gunshots were fired from such a distance as it is consistent with the width of the *Rasta* between the step of the deceased's house where the deceased was hit with the bullet and the road side wall of the house of accused Kamraj.

The question of the distance of gunshot firing is considered from the point of view of certain recognised medico-legal principles, namely these. When a firearm is discharged from a distance, there will to total absence of the characteristics of a 'near' discharge; ingraining of unburnt particles of powder is absent if fired from beyond ten feet; at a distance of twelve to fifteen feet, there is an absence of a main wound as all the pellets enter individually covering an area of about ten inches in diameter; at this distance the pattern formed by the entering shot will consist of small groups at a distance of thirty feet all the shots enter as individual pellets without any grouping and cover an area of about twenty inches in distance; these examples must of course be considered as a general guide in determining the distance at which the weapon was discharged; there are so many circumstances to be considered such as, length of barrel, choke or cylinder, black or smokeless powder, size of shots, (*Cox's Medico- Legal Court Companion*, 4th Edition p 33).

Considering the evidence in the present case in the light of the medico-legal principles, it is abundantly clear – from the manner the pellets from the gunshots dispersed widely all around

– that the gunshots were fired from a distance more than thirty feet, namely, thirty feet, which is the distance of the accused Kamraj's road-side wall from the step of the deceased's house where the deceased was hit with bullets – pellets scattered or dispersed all around. The dispersal of the pellets speaks for itself about the distance.

In the ultimate analysis the question arises: Is the circumstantial evidence sufficiently strong to support the order of conviction under section 302/34 in this case? The position in law as settled by the Supreme Court is in substance this: Where there is no eye-witness to the murder and the case against the accused depends entirely on circumstantial evidence, the standard of proof required to convict the accused on such evidence is that the circumstances should be so far complete as not to leave any reasonable ground for conclusion consistent with innocence of the accused. It is true that in a case of circumstantial evidence not only should the various links in the chain of evidence be clearly established, but the completed chain must be such as to rule out a reasonable likelihood of the innocence of the accused. But in a case where the various links have been satisfactorily made out and the circumstances point to the accused as the probable assistant, with reasonable definiteness and in proximity to the deceased as regards time and situation, and he offers no explanation, which, if accepted though not proved, would afford a reasonable basis for conclusion on the entire case consistent with his innocence, such absence of explanation or false explanation would itself be an additional link, which completes the chain.

8.21.28 Injury-Firearm Linkage[74]

A faint attempt was made by Mr. Ray that the prosecution has failed to establish that the gunshot injuries on the deceased were from the gun (M.O. II). The contention is frivolous and was rightly abandoned later on. It is the common case of the parties that there was only one gun at the time of occurrence and that gun belonged to and was held by accused No. 1 on the spot. The finding being that the deceased died as a result of gunshot injuries, it was not necessary for the prosecution to further establish that the injuries caused by gunshot were from the gun (M.O. II). The conclusion that the gunshot was through M.O. II is irresistible on the common case of the parties and no further proof is necessary as is required in some cases of gunshots.

8.21.29 Identification of Firearm Injuries[75]

The trial court seems to have overlooked this statement and confined itself to the less specific statement of Ajit Singh given at the trial. The fact remains that at the earliest, in the committal court, the appellant clearly alleged that Baldev Singh had been killed with a *sua* by the complainant party. This version was put to Dr. H.C. Gupta, who had performed the autopsy of Baldev Singh, in cross-examination, even in the committal court. The doctor replied that he could not rule out the possibility of these injuries having been caused with a *sua*. This opinion was not discussed by the trial court. The learned judges of the High Court also did not advert to it. Although in examination-in-chief, the doctor had said that these injuries were 'likely to be caused by a firearm', the circumstances on record definitely point towards the conclusion that the injury was probably caused with a sharp-pointed weapon and not with a gun. The injuries were triangular. The dimensions as noted by the doctor were:

(i) three-fourth" x one-second" x three-fourth" on the front of the neck in the mid-line about 11/2" below the chin;

(ii) Lacerated wound 1" x one-second" x one-third" on the back of the neck about 1" below the hair line.

74. *Paramananda Mahakud v State of Orissa*, ILR (1969) Cut 53 : 1970 Cr LJ 931 (HC).
75. *Bhoor Singh v State of Punjab*, AIR 1974 SC 1256 : (1974) 4 SCC 754 : 1974 Cr LJ 929 (SC).

A gunshot wound of entry caused by a single pellet or ball is ordinarily circular or oval in shape. If these injuries were the result of a gunshot fired from close range, with all the pellets piercing *en masse* through the neck, there should have been scorching, blackening and tattooing in and around the wound of entry. The wadding, or round cardboard pieces or pellets should have been found inside or outside the wound near the body. Nothing of this kind was found. Furthermore, the very story of Ajit Singh firing at Isher Singh, but instead hitting his own brother was improbable. According to the prosecution, Isher Singh was then interlocked in a struggle with Baldev Singh. If that was so, there should have been some gunshot injury on Isher Singh. But the doctor did not find any such injury on him.

The above negative and positive circumstances are tell-tale. Taken in conjunction with the doctor's opinion given in cross-examination, they probabilise the defence version that the injuries to Baldev Singh were caused with a sharp pointed weapon – and not with a firearm – by the complainant party.

We have, therefore, no hesitation in holding that the learned judges of the High Court were in error in upholding the conviction of the appellants for the murder of Baldev Singh, merely, on the basis, of what they termed "plausible explanation" rather than positive and convicting proof given by the prosecution. We would therefore, set aside that conviction.[1]

8.21.30 Firearm examination[76]

The recovered pistol had been sent to FSL Rohini for examination along with the cartridges and cartridge cases and one metallic piece recovered from the body of the deceased at the time of post-mortem. The Senior Scientific Officer has proved the Ballistic Report and has proved that the pistol was the same which had been examined by him as F1 and the cartridges were the same which had been sent to him for examination. He has also identified the test fired bullets and the cartridges which were sent to him for examination and the test fired cartridges. The witness has further proved that the improvised pistol was a firearm and the cartridges, cartridge cases, fragment of jacket of bullet and bullet were ammunition as defined in Arms Act. He has conclusively proved that the cartridge cases which had been recovered from the pistol had been fired through the improvised pistol which he has opined since the individual characteristics of firing pin marks and breech face marks present on the said cartridges were found identical when compared with the test fire cartridges under microscope examination. Further, the ballistic report in respect of the swabs of the accused shows that gunshot residue particles (GSR) were detected around the hole on the half sleeves shirt (belonging to the injured). However, no opinion could be given on the swabs due to insufficient data. Therefore, under these circumstances, the prosecution has been able to establish that two bullets had been fired from the pistol snatched from the hand of the accused.

Thus, it is fairly established by the testimony the Senior Scientific Officer-cum-Ex-Officio Chemical Examiner GNCTD FSL Rohini that the death of the deceased and the injury of the injured was a result of the bullets fired upon them by the appellant by use of the same firearm which was recovered. The bullet recovered from the seized pistol and that retrieved from the body of the deceased are of the same origin and fired from the seized pistol, as established by the ballistic reports led in evidence by the prosecution.

In *Prabhu Dayal v State of Rajasthan*[77], the misfired cartridge, the fired cartridge, and the country made pistols were subjected to the examination of the Forensic Science Laboratory. It was clearly stated in the Forensic Laboratory's Reports that the country made pistol contained

76. *Anil Kumar v State*, 2018 (4) ADR 168
77. *Prabhu Dayal v State of Rajasthan*, Criminal Appeal No, 2324 of 2014, decided on 4 July 2018 (SC).

in packet 'H' was in working order. However, it has a tendency to mis-fire the ammunition. It is also stated that the cartridge found in the very packet was fireworthy ammunition.

The report of the Ballistic Expert further makes it clear that based on stereo and comparison microscopic examination, the 12-bore cartridge case from packet 'G' could have been fired from a 12-bore country made pistol. Hence, it is clear that out of the two pistols seized, one pistol had got a tendency to mis-fire and the other had fire worthy ammunition.

Thus, the reports of the Forensic Science Laboratory fully support the case of the prosecution, inasmuch as it is the evidence of the witnesses that Gopal was fired at by Gyan Singh as well as the appellant herein. Among the shots fired, one of the gunshots was mis-fired. Be that as it may, the fact remains, as mentioned supra, that all the five members including the appellant were members of the unlawful assembly which had the common object of committing the murder of the deceased. Hence, the trial Court and the High Court are justified in convicting the accused having regard to the evidence on record. Accordingly, the appeal before this Court stands dismissed and the sentence of life imprisonment imposed upon the appellant stands confirmed.

8.21.31 Dimensions of Injuries[78]

We reserve for the end of this chapter a clinching piece of evidence which establishes that Tahsildar did not shoot Dudh Nath, inasmuch as we shall show in what follows that the latter was shot with a bullet fired from a .303 bore rifle and not a .500 bore rifle, the only weapon attributed to Tahsildar by the prosecution witnesses. What we call the clinching piece of evidence derives from the medical evidence with regard to Dudh Nath's injury.

This evidence discloses that the wound of entry of the bullet was in front of the abdomen and was one-fourth" x one-fourth" in size, while the wound of exit was on the back and was one-third" x one-third" in size. In the trial court no one paid any attention to the nature of the bullet causing an injury of these dimensions, and everyone seems to have assumed that it was in fact from a .500 bore rifle bullet. We considered this assumption of doubtful validity, hence we heard learned counsel specifically on the point and also consulted Taylor's *Medical Jurisprudence* and Major Julian S. Hatcher's *Fire-Arms Investigation, Identification and Evidence*. Referring to high-velocity bullets Major Hatcher observes at p 202 of his book:

> *The skin wound of entrance always corresponds in size to the diameter of the bullet used. It is very common for the aperture of the entrance to appear smaller than the diameter of the bullet but this is an illusion, since the wound invariably admits a projectile similar to the one which caused it.*

The small appearance is due to elasticity and shrinkage of the skin. It is also a fact that the wound of exit is usually larger than the wound of entrance. But no authority has been cited before us which could suggest that, unlike a wound of entry, the wound of exit can be smaller than the size of the bullet which causes it. During the hearing of the appeal we invited the learned state counsel to produce an expert before us who might give such an opinion, but he was unable to produce one.

Bullets of both .500 and .303 bores were produced before us, and by measurement we found that a .500 bore bullet has a diameter of exactly half-an-inch, while that of a .303 bore bullet is slightly less than one-third of an inch. These measurements, coupled with the expert opinion contained in the above mentioned standard work, leave no room for doubt in our mind that Dudh Nath's injury was caused by a .303 bullet and not by a .500 bullet, and we should like to point out that we are strongly of opinion that if the prosecution case that Tahsildar fired the

78. *Tahsildar Singh v State of Uttar Pradesh*, AIR 1958 All 255 : 1958 Cr LJ 424.

rifle Ex. 1, which is of .500 bore, were true, Dudh Nath's entry and exit wounds would have been larger than that found by the Medico-legal expert. In point of fact, the wounds which were actually found by the Medico-legal expert are typically those caused by a .303 bullet.

This finding would exculpate the appellant of Dudh Nath's murder. Incidentally, for the benefit of subordinate courts we should like to point out that where a particular weapon is stated to be responsible for a certain injury, the witness should be asked to explain whether or not that weapon could cause the injury in question. In the instant case the omission to do this with regard to the injury of Dudh Nath and Karna has led to unnecessary difficulty.

8.21.32 Firearm Injury Frauds[79]

After hearing both sides we are of opinion that the appellant's conviction cannot be sustained. There are several circumstances which throw a doubt with regard to the appellant being the author of the gunshot injury received by the injured, Sansar Singh. *Firstly*, the first information report was lodged after a delay of three days, although it was admitted, that the injured person was conscious throughout after the receipt of the injury. *Secondly*, the gunshot injury was on the back of the victim and in his deposition he did not say that immediately after the receipt of the injury he turned back and saw his assailant. Of course, the courts below have imagined this explanation, which the injured himself had not chosen to put forth. The *Third* circumstance which enhances the suspicion about the identity of the assailant that the victim's statement was recorded by the police under the Code of Criminal Procedure, 17 days after the occurrence and 5 days after his discharge from the hospital. No explanation of these delays is coming forth. The *Fourthly,* circumstance is that an attempt was made by the prosecution to rope in the other two brothers of the appellant who have been acquitted by the High Court. *Fifthly*, the conviction rests mainly on the uncorroborated testimony of the injured. His father (PW 1) who had lodged the report came after the incident and was not an eye-witness of the incident. PWs 3 and 4 who were cited as eye-witnesses in the FIR, did not support the prosecution case at the trial, *Sixthly*, there was past enmity between PW 1 and his son (PW 2) on one side and the appellant and his brothers on the other. The occurrence took place after dusk at about 7.30 pm.

8.21.33 Close-Range Phenomena[80]

The nature of the wounds said to have been inflicted on account of the gun being placed on the chest and fired does not fit in with the allegation. It is true that the doctor was not questioned about it. In fact the doctor made the statement that these wounds were due to the gun being fired by being placed on the chest or from within a range of one yard. We are of opinion that in this the doctor was wrong and probably got misguided on account of the black margins of the wounds. The black margins of wound are never due to the firing of the gun from very close range but are due to something different. Taylor says at p 430 of his *Principles and Practice of Medical Jurisprudence*, vol I, 10th Edition:

> *The edges of the wound commonly show a narrow ring of discolouration due to the removal of a layer of epithelium by the passage of the bullet. The surrounding skin may be scorched or not, and there may be a zone of blackening or peppering with grains of powder, according to the distance from which the weapon was fired.*

And again at p 431:

> *All entrance wounds, if examined, will be found to have a zone of denuded epithelium immediately surrounding the orifice. This is caused by the spin of the bullet and tends to dry and*

79. *Satbir v State of Uttar Pradesh*, AIR 1982 SC 1216 : 1982 SCC (Cri) 132 : 1982 Cr LJ 1734 (2).
80. *Sheo Shanker v State of Uttar Pradesh*, AIR 1953 All 652 : 1953 Cr LJ 1400 : 1953 All LJ 720.

become discoloured shortly after death. It should not be confused with the marks due to powder for it gives no indication of range.

And again at p 441:

The bruised and dark appearance which a gunshot wound sometimes present, even when the weapon is discharged at a distance from the body has led to the supposition that this effect was due to a burn and that the bullet burnt the parts which it touched, but this idea is not correct. The projectile never becomes sufficiently heated to acquire the power of burning.

Of course no scorching of the wounds could have been possible in this case when the victims had several clothes on, even if the firing had been from very close range. And that again shows that the doctor's opinion was due to the existence of black margins and not due to any scorching of the surrounding skin. Again Taylor says at p 430.

We must distinguish between near wounds and far wounds. Usually when a weapon is discharged in contact with or within an inch or so of the body the gases which pass out with the bullet enter the tissues and thereafter expand causing tearing of the skin or clothes very often in the form of a cross or a split. Most of the powder is found inside the tissues, but there may be traces of blackening, burning and tattooing around the entrance hole – if the weapon is discharged at a short distance from the skin the effect of the gases is lost and the entrance wound look like a hole which might be caused by pressing a lead pencil into the tissues. It is rounded with inverted edges and surrounded by a zone of singeing, blackening from the smoke and tattooing from the impaction of small particles of powder in the skin.

The clothes did not show such tearing or splitting. It is, therefore, clear from the condition of the clothes which the victims were wearing that the gun does not appear to have been fired by its being placed on the chest or very close to the chest after the victims had fallen down. The position of the first two wounds on Girdhari is also not very consistent with the position of the gun. It is not expected that he would be lying on the left side when the gun would be so fired.

8.21.34 Near Range Wound[81]

Coming to the 9th and the last reason mentioned above it would be noticed that shirt of the deceased was found to be torn at two places. His *dhoti* was also torn and *kachha* was found torn at some places. It was not Manphool's evidence that Ram Sarup while going with him was wearing torn and tattered clothes. He was, therefore, obliged to give an explanation for their being found torn. The explanation was that while putting Ram Sarup on the bullock cart the clothes got torn. The trial judge found it difficult to swallow this explanation. In our opinion the High Court was wrong in accepting it. In the circumstances of the case the probability of the clothes being torn and especially of the *kachha* in the manner suggested by the prosecution, was not there at all. On the other hand, it was quite legitimate to think that Ram Sarup had a scuffle with his assailant and the clothes got torn in that scuffle. Neither Manphool nor P.Ws. 4 and 5, perhaps, saw the occurrence. It is also clear that the gun was fired by the assailant at Ram Sarup's thigh from a very close range. The muzzle of the gun at the time of fire must not be more than a foot away from the thigh. The doctor who did post-mortem examination found a piece of cardboard torn in four parts and a metallic pellet in the left thigh of Ram Sarup. There was burning of the margins of the wound of entry. The doctor was not quite right in saying that it is due to heat of the bullet or the pellet. And this showed that the gun was fired from a close range. The High Court was also of the same view. The ocular version of the occurrence given by the prosecution witnesses 2, 4 and 5 does not indicate that the gun was fired by the respondent after he had come very close to the deceased.

81. *Bahal Singh v State of Haryana*, AIR 1976 SC 2032 : (1976) 3 SCC 564 : 1976 Cr LJ 1568.

Rather, according to the evidence of Manphool it was fired from a distance of about 1-one-second pondas, *i.e.,* about 7-one-second feet.[1]

8.21.35 Medico-legal Evidence Failure[82]

[**Author's note:** If a shot is fired "***touching the chest"*** or skin, the whole ejecta may enter the body *en masse***.** No blacking/tattooing is observed in some such cases**.** The court should have accepted the eyewitness account; or called a Ballistics expert.]

While we are on the medical evidence it would be appropriate to mention that there was no tattooing or charring on any of the firearm injuries which, according to the doctor, shows that the firing was done from a distance of more than 4 feet. In the First Information Report Bal Kishore has stated that as soon as he, his father and sister, reached the culvert, Subhash "touching the chest" of Ram Sanehi "with the barrel of his gun" said that he shall not leave him alive. Shyam Narain thereupon exhorted Subhash not to delay and fire immediately; Subhash then fired three shots in quick succession, one of which misfired. The trend of the FIR is that Subhash fired the first two shot at Ram Sanehi from a point-blank range, in which event, indisputably, there would have been tattooing and charring around the injuries. Bal Kishore has attempted to offer an explanation that what he meant to say in his complaint was that Subhash trailed his gun "towards', Ram Sanehi's chest and not "on" his chest. This explanation is an after-thought and in the circumstances difficult to accept. Thus, in another important respect, the medical evidence falsifies the case of the prosecution.[2]

8.21.36 Self-Defence or Murder[83]

For ascertaining as to whether or not the shots or missiles, which caused the injuries of Dial Singh deceased and Swaran Kaur, were discharged from the same cartridge, we called and examined Dr. B.R. Sharma, Director of the Forensic Science Laboratory, Chandigarh, in this court, to assist us with his expert opinion.

Dr. B.R. Sharma is definitely of the opinion that the two shots found in the parcel, Exhibit p 1, *i.e.*, one extracted from the wall of Sardul Singh and the other picked up from near of house of P.W. Malagar Singh, had been fired from a 12 bore cartridge of standard L.G. size, while in the case of the third shot found in the parcel, Exhibit p 2, the expert opined that it had been fired from a 12 bore cartridge of L.G. or S.G. size. The reason given by the expert, is, that the two shots found in the parcel, p 1, weighed 4.41 grams and 4.24 grams, and that portions of lead from these shots had probably chipped off. The standard weight of L.G. and S.G. shots, according to the expert is 4.54 grams and 3.54 grams, respectively. The deformation of the two shots indicated that they had been fired from a gun.

As regards the shot found in the parcel, exhibit p 2, the expert stated that it was in a greatly deformed condition and probably some of its lead had chipped off. Its weight was 2.76 grams, which weight was greater than the weight of a shot from any other cartridge of standard specifications than L.G. or S.G. The spherical shape of the undamaged portions of these shots indicated that they were factory-made. In an L.G. cartridge of standard size there are 6 shots, in all, while in an S.G. cartridge of standard size there are 9 shots. The diameters of L.G. and S.G. shots are 0.36" and 0.33", respectively. After examining the pictorial diagrams prepared by Dr. Satish Chandra and Dr. Jatinder Singh about the location of the wounds of Swaran Kaur and Dial Singh deceased, respectively, the expert explained that the shots during their passage

82. *Subhash v State of Uttar Pradesh*, AIR 1976 SC 1924 : (1976) 3 SCC 629 : 1976 Cr LJ 1521.
83. *Mohan Singh and Teja Singh v State of Punjab*, Criminal Appeal No, 414 of 1969 (P&H).
Also see: *Hate Singh Bhagat Singh v State of Madhya Bharat*, AIR 1953 SC 468 : 1953 Cr LJ 1933 (SC) : 1952 MBLR (Cri) 1.

through the body of Dial Singh, had suffered deformation, flattening and expansion by their impact with the bones and because of resistance of the flesh. This explains why the dimensions of two of the wounds on Swaran Kaur were greater in cross-sectional area than those of the entrance wounds found on Dial Singh.

Dr. B.R. Sharma was further asked that if in his opinion the injuries to both the aforesaid persons were caused by shots discharged from the same fire, why then the injuries to Swaran Kaur were at a lower level (just above and near about the knee) than those found on the deceased (which were at the level of the nipple). He replied that

1. *firstly*, the shots had, after entering the body of Dial Singh, deflected downwards. This, according to the witness, was particularly true in the case of injury number 1, the exit wound of which was at a lower level than its entrance wound.
2. *Secondly*, Dial Singh deceased must have instinctively ducked while receiving the shots or at the instant when the shots came out of his body.

It is in the evidence of Joginder Kaur, P.W. 5 that immediately after the gunfire the deceased was seen in a bending position and staggering with his hands placed on his wound towards the doorway of Malagar Singh. It was thus probable that the deceased at the time of receiving the shots, or, at any rate, a split second thereafter when the shots were coming out of his body, had by sheer reflex action dipped.

There is, therefore, nothing unbelievable in the categorical version of the eyewitnesses that Dial Singh and Swaran Kaur were hit by the same gunfire made by Mohan Singh.

Mr. Mahajan contended that the shape of the entrance wounds on the body of Dial Singh was quite circular, which meant that the victim was standing erect when he received those wounds.

This argument is not tenable.

1. *Firstly*, the doctor has noted that the margins of these wounds were irregular, also.
2. *Secondly*, the deceased might have started ducking simultaneously with the impact of the shots and continued doing so when the shots were travelling through his body. Furthermore, the shot which caused injury number 1, while travelling through the body of the deceased, had fractured the rib. It must have, therefore, deflected in its course. Even pictorial diagrams (which may not be very precise) prepared by the doctor, show that the exit wound of this injury was at a somewhat lower level than its entrance wound. This gives some indication that the shots after piercing the body of Dial Singh, travelled in a somewhat downward direction.

It may also be noted that the distance between the deceased and Swaran Kaur at the time of the gunfire has not been fixed with precision. According to Karam Singh, P.W. 4, when the gun was fired he was standing behind Dial Singh deceased at a distance of about 4 Karams and Swaran Kaur was at a distance of one Karam from the witness. P.W. Malagar Singh has also stated that at the crucial moment, Swaran Kaur was standing in the lane towards that side where P.W. Karam Singh, his wife and mother were present.

In the note appended to the site-plan, Exhibit PN, it is mentioned that Swaran Kaur was at point number 3, at a distance of about one Karam from point number 1, where the deceased was hit. This note is obviously wrong. It does not conform to the evidence given by the witnesses at the trial. The distance between points 1 and 3, measured by a scale, is more than one-second". The scale of the site-plan is 10 Karams equal to an inch. If the points 1 and 3 have been marked accurately, the distance of Swaran Kaur at the time of the gunfire from the deceased was about 4 or 5 Karams, *i.e.*, roughly 21 to 30 feet. Thus, even if the deceased had ducked only to a small extent when the shots hit him, then also

the slightly downward direction of the shots coming from the body of Dial Singh could have hit Swaran Kaur in the region of the thigh and roundabout the knee. The effective range of an L.G. cartridge, fired from a 12 bore gun, according to Dr. Sharma is 100 yards. It is in the prosecution case that Mohan Singh had fired at the deceased from a distance of about 4 Karams, *i.e.*, about 22 feet or so. Swaran Kaur, as already discussed, was about 4 Karams behind the deceased. This means, she was about 8 or 9 Karams, *i.e.*, about 50 feet or so, from Mohan Singh appellant, at the time of firing of the shot. The very fact that four of the shots had pierced through the body of the deceased, while lending assurance to the ocular account of the prosecution witnesses with regard to the distance from which the gun was fired, also strengthens the inference that those shots were of a relatively high-powered cartridge, most probably of an L.G. cartridge. Shots of an L.G. cartridge fired from a distance of about 20 or 25 feet could, even after piercing through the body of the deceased, have enough power left in them so as to cause fracture of the femur bone of Swaran Kaur. The circumstance that they did not pierce through the body of Swaran Kaur further shows that their velocity at that time was lower than what it was at the time of hitting Dial Singh.

The story that the deceased was also armed with a pistol which he first fired at Teja Singh but injured Swaran Kaur and then had reloaded the same and was about to fire same at Mohan Singh, does not inspire confidence. It has an aura of improbability. If the deceased had come to assist Karam Singh against Teja Singh and others when Karam Singh, according to the defence allegation, was assaulting Teja Singh, then there is no reason why a shot allegedly fired by the deceased from such a close range failed to find its mark on Teja Singh. It is nobody's case that the deceased or any other person on the complainant side wanted to harm Swaran Kaur who was standing near P.W. Karam Singh. If the shot which hit Swaran Kaur had been fired by the deceased, who was also quite close to Karam Singh – there should have been blackening, tattooing or charring around the wounds of Swaran Kaur. No such blackening, was noticed by Dr. Satish Chander, absence whereof also indicates that the shots which hit Swaran Kaur had been fired from a distance beyond 6 feet.

8.21.37 Onus of proof on State[84]

It is said that after he had covered a few steps and had arrived near the water-hut (pyaoo) the appellant fired three shots at him with his rifle. The three shots after killing him pierced through his body and hit three more persons on the platform, namely, Hari Singh, Rameshwar Singh and Kailash Chandra. They were also badly hurt. This shocking incident was seen by several persons including Chandra Prakash Tewari P.W. 22, Mahesh Chandra P.W. 6, Dudhi Ram P.W. 2, Ganga Das P.W. 3 and Pushkar Singh P.W. 23. All these persons apprehended and disarmed him. Chandra Prakash Tewari, then took the appellant to the police station. There Chandra Prakash Tewari deposited the rifle of the appellant at the police station.

The appellant pleaded not guilty and claimed to be tried. He admitted that on 21-10-77 he had been escorting 14 Down along with rakshaks Bholey Prasad, N.P. Mathew and Mahendra Singh. He and Mahendra Singh happened to be in a compartment at the rear end of the train while the others were in front part of the train. Sri D.N. Misra who happened to be in mufti dress met him and enquired from him as to how many rakshaks were on escort duty in the train. He did not disclose the number of rakshaks on escort duty in the train and this led to an exchange of hot words between them. Sri D.N. Misra felt irked and tried to snatch away his rifle. He asked him not to snatch his rifle. He did not listen to him and continued with his unlawful activity. Apprehending that he might lose the rifle he fired three times in defence of

84. *Gautam Lal v State of Uttar Pradesh*, 1981 Cr LJ 1187 (SC).

his property. The third shot hit D.N. Mishra and he fell down dead on the platform. According to him, nobody arrested him on the platform and he himself surrendered at the police station.

We have heard the learned counsel for the parties at sufficient length and after doing so we are firmly of the view that this appeal must be allowed. We find that the court below has not approached this case from a proper angle with the result that it fell in error and passed a wrong order of conviction against the appellant. It is true that the appellant admitted to have fired upon D.N. Mishra causing fatal injuries to him but this admission on the part of the appellant, in our opinion is not sufficient to fasten the guilt of murder on him. The burden which rests on the prosecution to establish its case beyond a reasonable doubt is neither neutralised nor shifted because the accused pleads the right of private defence. The prosecution must discharge its initial traditional burden to establish the complicity of the accused and not until it does so can the question arise whether the accused has acted in self-defence. This position, though often overlooked, would be easy to understand if it is appreciated that the Civil Law rule of pleadings does not govern the rights of an accused in a criminal trial. Unlike in a civil case it is open to criminal court to find in favour of an accused on a plea not taken up by him and by so doing the court does not invite the charge that it has made out a new case for the accused. The accused can be convicted only when the prosecution succeeds in proving that the incident in question had taken place in the way as alleged by it. The prosecution must stand on its own legs and cannot take advantage of the weakness of the defence. Nor can the court, on its own, make out a new case for the prosecution and convict the accused on that basis. It is now well-established that when the very substratum of the evidence given by the eye-witnesses examined by the prosecution is found to be false, then the only prudent course left to the court is to throw out the prosecution case in its entirety. In the instant case we find that the eye-witnesses examined by the prosecution have not cared to disclose the true picture of the incident. According to the prosecution witnesses the appellant had fired three shots at D.N. Mishra and all these shots hit him. After killing D.N. Mishra these shots pierced through his body and they hit three persons more, namely, Hari Singh, Rameshwar Singh and Kailash Chandra. Hari Singh succumbed to his injuries a few hours later but Rameshwar Singh and Kailash Chandra were lucky to survive. One of the shots had lodged itself in the body of Hari Singh and the same was recovered from his body at the time of post-mortem examination. The court below did not avail of the services of a ballistic expert to get that shot examined. In this court we sent that shot to the ballistic expert for examination and report. The ballistic expert examined and stated before us on oath that he did not find any rifling marks on the shot. He was, therefore, unable to give a definite opinion whether the shot examined by him was a rifle bullet. However, we think that it could not have been a bullet because no rifling marks were found on it. If that is so, then it means that Hari Singh did not die of a rifle shot fired by the appellant. Obviously, therefore, he died of a shot that had been fired by somebody else. The prosecution story that he died of a shot fired by the appellant is, therefore, patently false. The falsity of the prosecution case becomes apparent from another fact also. Rameshwar Singh had received a lacerated gunshot wound 8 cm x 3 cm muscle deep. He was also said to have been injured from the rifle shot fired by the appellant. The ballistics expert examined by us is of the opinion that a rifle bullet cannot cause a lacerated wound measuring 8 cm x 3 cm muscle deep. This opinion of the ballistics expert was not challenged by the prosecution. Thus, from this it again follows that Rameshwar Singh did not receive his gunshot wound from the firing done by the appellant.

8.21.38 Accident or Murder[85]

1. The fourth is that the gun, which the deceased Asghar Ali carried, after having obtained it under unexplained suspicious circumstances was a very defective weapon. According to

85. *Nirbhai Singh v State of Madhya Pradesh*, 1972 Jab LJ 383 : 1972 MPWR 625 : 1972 Cr LJ 1474 (MP).

Nigam, ballistic expert (P.W. 7), it was a 12 bore double barrelled breech loading hammerless gun. Although the normal trigger pull of such a gun is about 6-7 lbs. the trigger pull of this weapon was only 2 lbs. According to the witness:

> *If the cocked gun is thrown on the ground the butt-end giving it a jerk, the gun, Article A, fires automatically. If the barrel of the gun, Article A, is struck with some force with any hard substance, the gun discharges.*
>
> *In cases where the trigger pull is low possibility of accidental discharge is there.*

The expert does not mention regarding its safety catch. When we examined the gun ourselves, we found that though it had a safety catch, it was so jammed that it did not work. There is no evidence to show that the police constable, Asghar Ali, was aware of all these defects and had taken precautions against its accidental discharge. It may well be that he did not know about the defects or may have thought, without properly testing the weapon that the safety catch was on, without realising that it was not on but jammed. Whatever that be, the prosecution has not explained why the deceased was carrying such a gun loaded with cartridges.

8.21.39 Murder not accidental fire[86]

The only question for consideration is whether the evidence on the record could justify the finding of the High Court that the gun went off accidentally, or whether it was fired intentionally to commit the murder of Smt. Tulsa Bai. In this respect the following facts and circumstances have been fully established.

The gun (article 'C') which was recovered from the room of the respondent near the dead body and was taken in police custody, was sent for examination by the ballistic expert (P.W. 10). He has stated that he found the gun in working condition and that its barrel showed signs of discharge. He has also stated the pellets which were recovered from the dead body could have been fired from it.

The above facts and circumstances are themselves quite sufficient to prove, beyond any doubt, that Smt. Tulsa Bai died as a result of gunshot injury from the gun of the respondent and in no other manner.

We have carefully examined the question whether the gun could have been fired in the scuffle to which reference was made by the respondent to Jawahar Lal (P.W. 6) and Ram Narain (P.W. 7). It is important to remember that Smt. Tulsa Bai was unwell and had been administered an injection of chloramine a little while ago. She was lying on her bed. The respondent also gave out that he was unwell and was lying on another bed nearly. It is difficult to understand why he, in that situation, should have thought of going to the field at that hour. Even if he wanted to go to the field, there was no necessity for him to load the muzzle-loading gun inside his room, and to ignore his wife's protests against his going when she was ill and did not want him to go. But apart from this, there are two important facts which completely disprove the theory of accidental firing which was set up by the respondent's counsel in the High Court.

Firstly, we find from the statement of (P.W. 14) that there were two apertures on the posterior fold of the left axilla of the deceased with blackening of the skin around them and the apertures were in the nature of wounds. On internal examination, he found that there was fracture of two ribs of the left side on the back. The two apertures were side by side. If it had been true that the gun went off accidentally during the scuffle with the wife the injuries would not have been on the back of her body but on some such part as could possibly come within the range of the gun during the scuffle. The position of the gunshot injuries, therefore, disproves theory of accidental firing and shows that the shot was fired while Smt. Tulsa Bai was

86. *State of Madhya Pradesh v Digvijay Singh*, AIR 1981 SC 1740 : (1979) 4 SCC 92 : 1981 Cr LJ 1279 (SC).

lying with her back towards the respondent. It is also significant that the doctor was not even asked whether the injury could be caused in a scuffle by accidental firing. On the other hand, we find that the statement of the Medico-legal expert that if the firearm had been discharged very close to the body, the pellets would have entered the body *en masse* causing one wound, and not two apertures side by side, was allowed to go unquestioned.

Secondly, if there had been a scuffle, and if the shot had been fired while Smt. Tulsa Bai was preventing the respondent from going away, her dead body would not have been found lying on the cot, as it has been stated by S.I. Bhanwar Singh that the dead body was lying on the bed as shown in map Ex. P-5.

We are, therefore, satisfied that the High Court misread the evidence in arriving at a completely contrary conclusion. It is true that both Jawahar Lal (P.W. 6) and Ram Narain (P.W. 7) had stated that the respondent told them about accidental firing during a scuffle with his wife, but it was not the respondent's own case during the trial that the gun went off accidentally. On the other hand, he took the plea that he heard the gunshot while he had gone out to answer the call of nature and that it was Jaswant Singh who was responsible for the firing. It was only when the courts did not accept that version, that the respondent's learned counsel thought of turning round and making his contention about accidental firing even though the respondent did not find it possible to set it up as a plea in his defence. The High Court also lost sight of the fact that the story of the scuffle was not corroborated by the evidence on the record, and it erred further in stating, without any reason, that statements of Jawahar Lal and Ram Narain were sufficient to discharge the onus of proving accidental firing. The High Court tried to explain away the incapacity of Smt. Tulsa Bai to have any scuffle with her husband by saying that a stiff opposition need not have been offered by her and that "by touching the gun or any other part of the body of the accused the deceased may have desired the accused not to go to the field". But if there had been some such touching, it could not be called a scuffle and would not have led to the firing of the gun. In this respect also, the High Court misread the evidence on the record. The High Court has stated further that the "position of the injury" also showed that the injury "suffered by the deceased was not intentionally caused by the accused". It has further been stated by the High Court that "if the accused wanted to kill her, it is not likely that he would have caused the injury on the arm near the axilla". The record, however, reads otherwise for as has been pointed out, the position of the injury was at the back and was by itself sufficient to exclude any possibility of accidental firing during the course of a scuffle. It is difficult for us to appreciate what exactly is meant by saying that if the accused wanted to kill his wife, it was not likely that he would have caused the injury on the area near the axilla. The report of P.W. 14 shows that the gun shot caused apertures on the posterior fold of the left axilla and fractured two ribs on the left side of the back. The High Court, therefore, misread the evidence in holding that the injury was caused on the arm near the axilla. What the Medico-legal expert had stated was that he found charring on the left arm, and not that the injury was located there. Moreover, the High Court did not appreciate that even a gunshot injury on the arm or the axilla would have been sufficient to cause death and that, as it happened, the injury on the back did prove fatal.

It may be that the prosecution was not able to prove the motive for the crime, but that could not possibly matter when the circumstantial evidence on the record was sufficient to prove, beyond any doubt, that it was the respondent and no one else who intentionally caused the death of Smt. Tulsa Bai.

8.21.40 Direction of Fire[87]

Mr. Basi Reddy in a forceful argument advanced the theory that the wound inflicted on the body of the deceased could not have been caused, if the first accused took a conscious aim at him. In support of his argument he relied upon the statement made by the eye-witnesses before the committing magistrate to the effect that the first accused wrested the gun from the hands of the second accused. It is said that, in the course of the wresting, the gun must have gone off accidentally and hit the deceased.

Reliance is also placed upon the evidence of the doctor in support of this theory. The doctor, as P.W. 4, says that the wounds Nos. 4 and 5 were exit wounds at the same level and that the deceased must have been shot from within about 10 yards. In cross-examination he further adds that the entry and exit wounds were almost on the same level in line with the first lumber vertebra. But he concedes that it is possible that there was a slight deflection on hitting the vertebra.

The wounds found on the body were described by him as follows:

1. A circular wound 11/2" in diameter (edges inverted) 4" from the umbilicus and 6" from the left nipple in the anterior axillary line (vertically paralleled to nipple line and a little away 11/2" to 2") with a part of the intestine projecting outside the wound.
2. An abrasion 1" diameter leftwards to the first wound.
3. A contusion 3" x 2" around the first wound.
4. Five performed wounds 11/2" in diameter in the right side of the abdomen in the lumbar region 3" above the right iliac crest.
5. A perforated wound 11/4" in diameter in the right arm at the level of the medical condyle in the right humerus.

Relying upon these wounds and the opinion of the doctor, it is contended that when a person shoots another of about the same height from a short distance on the side of abdomen, it is impossible to cause an injury which would cause wounds almost in the same level in line with the lumbar vertebra.

To put it differently, the argument is that, if the first accused shot the deceased on the side of the abdomen, the bullet could not have passed in a straight line from one side to the other but should have passed only in the direction in which the gun was placed, *i.e.*, the wound should have been not in a straight line, but in a slanting direction. The learned advocate also made a demonstration with a gun showing that the trigger could easily be released with a slight pressure. It is true that, the wound might not have been caused in the manner now found on the dead body.

Even then, there is no guarantee that the bullet would pass only in a slanting direction corresponding to the way in which the gun was held, for there might have been a deflection of the bullet when it came into contact with the vertebra. The evidence has not made it clear that the trace of the wound was also in a straight line.

But we do not think it is advisable to speculate on the basis of theoretical considerations. The first accused is 19 years old and the second accused is 65 years old. They were pursuing the deceased. The first accused found his father's hand shaking. He took the gun from him and shot the deceased. The first accused obviously must have been in an emotional state and he could not have had an opportunity at the time to take aim as he would have done in ordinary

87. *Re T Munirathnam Reddi ()*, AIR 1955 AP 118 : 1955 Andh WR 53 : 1955 Cr LJ 917 (SC). Also see *Rama Swami v State of Tamil Nadu*, 1951 (2) Mad LJ 630.

circumstances when he would shoot an animal or bird. In the hurry, he would have taken the gun from his father and released the trigger immediately. It is not possible to say in what position he kept the gun when he released the trigger.

The fact that the witnesses stated that he aimed at the deceased cannot be taken to mean that he aimed at the deceased in the manner he would have done under ordinary circumstances. We cannot, therefore, reject the evidence of the eyewitnesses relying upon some theoretical considerations based upon the nature of the wound. We, therefore, hold that the first accused committed the offence of murder.

8.21.41 Improper Post-mortem Examination[88]

The contention on which considerable emphasis has been laid by the learned counsel for not believing the eyewitnesses is that their evidence is in conflict with the medical evidence. We shall, therefore, advert to the medical evidence at this stage. PW/12 has deposed that he found the following injuries on the dead body of the deceased Gamu:

1. Gunshot wound (wound of entry) 2" x 1", lung deep, in left infra clavicular region, 11/4" lateral to left sternoclavicular joint, charring of margins of wounds, margins inverted, wound directed downwards, backwards, and laterally.
2. Gunshot wound (wound of exit) 31/2" x 11/4", lung deep, middle of left side of the back, 2" lateral to midline at the level of the lower part of the scapula.
3. Lacerated wound one-fourth" x one-fourth" muscle deep, 2" above the wound No. 2. On opening the dead body, it was further found that the 1st and 2nd ribs on the left side were fractured on the anterior side (front) and 5th, 6th and 7th ribs were fractured posteriorly (back). Pleura was ruptured at two places. Fluid blood was present on the left side, about 400 ml. A lacerated wound 2" x 2" through and through in the upper half of the left lung was found and the lungs were collapsed. Left pulmonary vessels were ruptured. The injuries, according to the doctor, were sufficient in the ordinary course of nature to cause death. He recovered 15 pellets from the dead body at the time of post-mortem examination. Out of these pellets, 12 were of small size and three were of big size and a few of them were lying loose in the wounds of the back and others were removed by dissection of skin around the wound on the neck. All were situated within an area of a circle of about 3" diameter from the centre of the wound on the back. In the wound of back, amongst the pellets, a few were of small size and bigger sized ones were also lying there. The edges of injury No. 3 were inverted and irregular. The learned counsel has laid great emphasis on the following portion of the statement of PW. 12 Purushottamdas Vyas:

   On the post-mortem appearance I am of the opinion that the wounds were caused most probably by one shot. But I cannot say definitely because of the fact that the pellets were of two different sizes and I am not expert about the pellets" … "The edges of injury No. 3 were everted and irregular. The edges of injury No. 2 were also everted and irregular. The margins of injury No. 1 were regular and oval shaped and inverted. It is correct that on the body of deceased Gamu there was only one entry of gunshot wound and of that entry there were two exit wounds. Injury No. 3, the exit wound, was probably due to the exit of two pellets. The wound of entry and the exit wound were through and through …

88. *Hussain Khan v State of Rajasthan*, 1976 Cr LJ 821 : 1975 Raj LW 374 : 1975 WLN 585.

> There was no scorching or tattooing around the wound No. 1. The distance of the firearm must have been between 1 to 3 feet from the victim.

There is a three pronged attack of the learned counsel. His contention is that according to the direct evidence there were two fires which hit the deceased whereas according to the medical evidence there was only one entry wound and two exits. Therefore, the direct evidence is believed. Another branch of his argument in this connection is that the gunshot wound in the chest of the deceased caused a big hole which must have resulted in profuse bleeding, but no blood was found from the hut in which the first shot is said to have been fired upto the place where the deceased fell dead on account of the second gunshot in the back. The third branch of his argument is that no wads and pellets were found inside the hut.

It may be pointed out that P.W. 12, was not a very experienced doctor when he had appeared in the witness-box. He passed his M.S. examination in 1971 and had entered in government service on 26 December 1970. This was admittedly the first post-mortem examination he had performed. He is also not definite in his opinion whether the injuries in question were the result of one gunshot or of two gunshots. He has qualified his opinion by stating that the wounds were caused most probably by one shot but he cannot say definitely because of the fact that pellets were of two different sizes. No doubt at another place the witness has stated that there was one entry of gunshot wound and there were two exit wounds and injury No. 3 was probably due to the exit of one or two pellets. The evidence of the doctor, in our opinion, does not exclude the possibility of there being two gunshots which may have struck the deceased. Maybe, that the second gunshot alleged to have been fired from behind by the assailant while the deceased was running, was not effective. On the basis of indefinite opinion of the medical expert as in the present case, we are not prepared to reject the direct evidence.

The learned public prosecutor has also urged that most of the pellets of the second gunfire may not have hit the victim on account of wide dispersion and the eye-witnesses may have thought that the second, shot hit the back of the deceased. The explanation furnished by the learned public prosecutor cannot be said to be altogether devoid of force.

In *Mohanlal v State of Rajasthan*,[89] it was observed that:—

> *There is always a tendency to over-emphasize discrepancies between the evidence of eye-witnesses and medical testimony. These discrepancies should be treated and appraised just like other discrepancies in the statements of the witnesses. It cannot be forgotten that the eye-witnesses may not give a very correct and accurate account of the version and may at places make exaggerations or may fail to give correct facts either on account of lapse of memory or on account of inability to observe minutely or to recite correctly. It should also be borne in mind that sometimes the Medico-legal experts also do not bestow sufficient care while performing examinations and their opinions may not be properly formed on account of inadequate or defective examinations or lack of complete knowledge. It is, therefore, hardly fair to expect a complete and perfect correspondence between the medical evidence and the eye-witness testimony. Naturally, therefore, the court may carefully examine the discrepancies and if it is reasonably open to arrive at a substantial and true version of the prosecution case, the courts should not adopt the easy course of throwing away the prosecution case on the alleged discrepancies between the medical evidence and the eye-witness testimony.*

In *Nankhusingh v State of Bihar,*[90] their lordships of the Supreme Court observed as follows:

> *When a person fires at a place where there are two persons, one witness may think that it is fired at one person and the others may think that it was fired at the other. Merely because the*

89. 1960 Raj LW 565 : (1961) 1 Cr LJ 155.
90. AIR 1973 SC 491 : 1972 Cr LJ 1204 : 1972 SCD 793.

> *inference drawn by one witness which may not fit in with the inference drawn by the other the factum of the firing at the place where the injured persons were, cannot be rejected. It cannot be held that the witness is a liar and he wanted to falsely implicate the appellant and others.*

Again in *Nihal Singh v State of Punjab,*[91] an argument regarding contradiction between medical evidence and direct evidence was repelled by their lordships of the Supreme Court in this way:

> *Another fact relied upon by the learned additional sessions judge in discrediting the eye-witnesses is that the witnesses stated that the deceased gave a Takwa blow on the head of Nihal Singh, but the medical examination showed only a small abrasion on his left thumb. The High Court explained that the witnesses must be describing only the movements of the accused with their weapons and they could not obviously give evidence as to where a particular weapon hit the body, for that would depend upon not only the manner in which the person wielded their weapons but also on the movement of the victim. A hit aimed at the head may, if the victim moves aside, miss altogether the body of the victim or fall on a part of his body different from that aimed at. There is certainly force in what the High Court said.*

Applying the reasoning adopted by their lordships of the Supreme Court in the cases cited above, the so-called contradiction or conflict between medical evidence and direct evidence pointed out by the learned counsel in the present case is, in our opinion, clearly explicable. Maybe, that the second shot did not hit the victim and the witnesses may have got an impression that the shot hit the victim on the back. Maybe, that only a few pellets of the second shot hit the victim and the rest went amiss. In our opinion, nothing turns upon this so-called contradiction or conflict between medical evidence and direct evidence.

In respect of P.W. 5, Smt. Jannat's statement, the learned counsel has drawn our attention to another discrepancy and it is this that Smt. Jannat states that the victim was at a distance of about one pace (roughly five feet) from the muzzle, whereas according to P.W. 3, Khanu, the accused fired the gunshot which hit Gamu from a distance of about six to seven paces. In our opinion, nothing substantially turns upon the discrepancy in the distance.

In *Janak Singh v State of Uttar Pradesh,*[92] their lordships of the Supreme Court observed as follows:

> *According to Dr. Ghosh's evidence, none of the three entry wounds showed any blackening or tattooing. Obviously, therefore, the firing did not take place from a very close range but from some distance at least. No doubt, the three eye-witnesses gave different distance ranging from two to six paces. But they could hardly be expected to have marked at the time the precise distance at which the person shooting the firearm was. They, therefore, gave an estimate of the distance at which he was from the victim. It is a wonder that the distances they deposed varied. Nothing can, therefore, turn on such variation.*

In this connection, the learned counsel has laid much emphasis on the fact that no blood marks were found either in the hut, where the first shot is alleged to have been fired, or outside the hut upto the place where the victim fell after the alleged second shot. The learned counsel has argued that looking at the size of the wound caused by the first shot, there must have been profuse bleeding and some blood must have fallen on the ground. But since there is no evidence that there was any blood either in the hut or on the way, the direct evidence is false. In our opinion, the argument, though it appears attractive, has no substance. We have it in the evidence that due to winter season the deceased was putting on a shirt and a woollen coat. Further, he had pressed the wound while running, with both of his hands. The clothes of the victim were found soaked with blood and it is quite possible that no such quantity of

91. AIR 1965 SC 26 : (1964) 4 SCR 5 : (1965) 1 Cr LJ 105.
92. AIR 1972 SC 1853 : (1973) 3 SCC 50 : 1972 Cr LJ 1177.

blood may have fallen either in the hut or on the way as may be collected for the purpose of investigation. A lot of blood spread out at the place where the victim fell. It is also possible that the man might have bled internally after receiving the first gunshot wound. Thus, in our opinion, the absence of blood marks in the hut or on the way is sufficiently explained.[1]

8.21.42 Number of Firearms[93]

Dr. SC Pandiya who performed the post-mortem examination has described in his evidence the injuries received by Ram Sanehi. In all he found 7 injuries on the dead body out of which injuries 1, 3 and 7, injuries 2 and 4, and injuries 5 and 6 are interconnected. Injury No. 1 is described as a "shot wound" with its entry above the left nipple. Injury No. 3 is described as multiple rounded abrasions on the left side of the chest. Injury No. 7 is the wound of exit on the right scapular region, corresponding to injury No. 1. Injury No. 2 consists of 8 gunshot wounds of entry below the right nipple while injury No. 4 consists of multiple rounded abrasions above the right nipple. Injury No. 5 is a gunshot wound of entry on the back of the left forearm while injury No. 6 is the corresponding wound of exit near the ulnar aspect of the left forearm.

The evidence of Dr. Pandiya and the description of the injuries given by him in the post-mortem report tend to show that two different kinds of firearms were used by the assailants of Ram Sanehi. Injury No. 1 was caused by a bullet and that is clear not only from the description of the injury but from what Dr. Pandiya has stated in his evidence. He says: "The bullet, which had entered through injury No. 1 went out straight after an emergency from injury No. 7". Injuries Nos. 2 and 5 were caused by pellets. This shows that whereas injury No. 1 was caused by a firearm of the nature of a rifle, injuries 2 and 5 were caused by an ordinary gun. The medical evidence thus falsifies the eyewitnesses' account according to which, the appellant Subhash alone was armed with double-barrelled gun, the other appellant Shyam Narain being armed with a lathi. The objective inference arising from the nature of injuries received by the deceased has a significant impact on the prosecution, which has been overlooked by both the sessions court and the High Court.[1]

8.21.43 Number of Shots[94]

1. The total number of used cartridges which were recovered from the scene of offence were five.

The Ballistic Expert has expressed his opinion that all the five cartridges were fired from the rifle which was seized from the appellant.

Having given our anxious consideration to this submission urged by learned counsel for the appellant we are unable to accede to it. Having regard to the fact that the appellant had used a dangerous weapon like a rifle (being a police constable he must have known that it was a dangerous weapon) and having regard to the fact that he had fired at Kaptan Singh as many as five shots, one of which was fired after Kaptan Singh was hit by a bullet and collapsed on the ground, it is impossible to accept the contention that the appellant had not done the act with the intention of causing his death. It is naive to argue that the intention was merely to frighten him or to cause grievous hurt for it overlooks the two salient features *viz*. (1) as many as five shots were fired from his 303 rifle; and (2) that he fired a shot even after Kaptan Singh had collapsed on the ground having been hit by one of the shots.

2. As we did not find ourselves in agreement with the above opinion in some of its aspects, especially that covering the type of projectile which caused injury No. 5, we had the entire

93. *Subhash v State of Uttar Pradesh*, AIR 1976 SC 1924 : (1976) 3 SCC 629 : 1976 Cr LJ 1521.
94. *Om Prakash v State of Haryana*, AIR 1971 SC 1388 : 1971 All Cri rule 368 : 1971 Cr LJ 1109 (SC).

matter examined by Dr. B.R. Sharma, Director, Forensic Science Laboratory, Chandigarh, to whom gun Exhibit p 3 and the projectiles recovered from the dead body were made over for observation and opinion, he being a ballistic expert who was examined as C.W. 1. He was of the view that injuries Nos. 1 to 4 could have been caused by a single shot fired from gun Exhibit p 3 and that injury No. 5 could have resulted from another shot discharged from the same gun. He was subjected by Mr. Sibal to a lengthy and searching cross-examination during the course of which he made the following points:

1. Injuries Nos. 1 to 4 could have been caused thus. The shot was fired from a distance of about 3 to 8 feet. The left shoulder of the victim was nearest to the muzzle of the gun and his head and face were turned towards the left. Three of the pellets caused injury No. 4. Two of them and the wads caused injury No. 1 and a single pellet resulted in injuries Nos. 2 and 3.
2. Injury No. 5 was caused by a shot from a distance of 2 to 5 feet, so that the charge entered *en masse*, although the whole of it was not recovered from a dead body. Tattooing and blackening should have been present in the case of this injury. The opinion of doctor (P.W. 2) that this injury was caused by a projectile having a diameter of about 1", is not correct.
3. In the case of both the shots, the ammunition used could have consisted of L.G. cartridges.
4. Charring is more often than not confused with the deposit of dirt around the wound or with contusions caused by the impact of the projectile. Tattooing would be observed in the case of a wound caused by a shot fired from a distance upto 8 feet.
5. Injuries Nos. 1 to 4 could not have been caused by a shot fired from a distance of "within 2 feet". This opinion is based on the impossibility of injuries Nos. 2 and 3 having been caused by a separate shot.
6. In the case of injury No. 4, the pellets skipped. If they had entered the body at the seat of the injury, the damage caused would have been extensive. On the left shoulder part of the shirt of the deceased were observed five holes, three of which indicated entrance of the pellets and two their exit, two of the former being in line with the latter and fifth one being very small in size with its location just above the other two entrance holes.
7. The phial said to contain the small pellet recovered from one of the wounds comprised in injury No. 4 had inside it only pieces of dried blood and no pellet.

The science of ballistics on which the testimony of Dr. Sharma (C.W. 1) is mostly based attaches quite some importance to the factors determining the distance from which a firearm causing a particular injury was probably discharged and we think it only right to take note at this stage of standard treatises on the subject. Reference may be made with advantage to the following passages appearing at pp 236 and 237 of Modi's *Medical Jurisprudence and Toxicology* (1969 Edn.):

The effects produced by small shot fired from a shotgun vary according to the distance of the weapon from the body, and choking device. A charge of small shot, fired very close to, or within a few inches, of the body enters in one mass like a single bullet making a large irregular wound with scorched and contused edges, and is followed by the gases of the discharge which greatly lacerate and rupture the deeper tissues. Particles of unburnt powder expelled from the weapon behind the missile are driven to some distance, through the wound, and some of them are found embedded in the wound and the surrounding skin which is also singed and blackened by the flame and smoke of combustion. The exit wound of a close range shot shows greater damage of tissues than the entrance

wound, the margins are everted, but there is no evidence of blackening or singeing. At a distance of one to three feet small shot makes a single aperture with irregular and lacerated edges corresponding in size to the bore of the muzzle of the gun, as the shots enter as one mass, but are scattered after entering the wound and cause great damage to the internal tissues. The skin surrounding the wounds is blackened, scorched and tattooed, with unconsumed grains of powder. On the other hand, at a distance of six feet the central aperture is surrounded by separate openings in an area of about two inches in diameter made by a few pellets of the shot which spread out before reaching the mark. The skin surrounding the aperture is not blackened or scorched, but is tattooed to some extent. At a distance of twelve feet the charge of shot spreads widely and enters the body as individual pellets producing separate openings in an area of five to eight inches in diameter, but without causing blackening, scorching or tattooing of the surrounding skin. At a distance of about 50 feet a pattern measuring about 14 inches from a fully choked barrel and about 28 inches from an unchoked barrel are produced and at about 100 feet the spread pattern on the target is about 30 inches from the fully choked barrel and 50 inches from an unchoked one. The scattering of the shot depends upon the size of the gun, the charge of the powder and the distance of the gun from the body. As the distance increases, the damage caused by a single pellet diminishes.

* * * * *

If over shot card wad is found in the wound it indicates that the shot was fired from less than two yards while its absence suggests more than two yards.

In conclusion it must be noted that it is not easy to give a definite opinion about the distance from which a firearm was discharged. According to *Taylor's Principles and Practice of Medical Jurisprudence* (Ed. X, Vol I,) p 441, no general rule can be laid down.

This is what John Glaister says on the subject at pp 244 to 247 of his work of the same name (1962 Edition):

These weapons have for their projectile, collections of small shot which vary in size, depending upon the type of cartridges employed. The small shot or lead pellets are held in position by wads, one placed between the powder and shot charges, the other on the top of the shot charge, and held in position by the end of the stout paper cartridge case turned over against it. After firing, the pellets disperse soon after their exit from the barrel, and this dispersion increases with the range. The degree of dispersion can be controlled to some extent by a 'choking' device near the termination of the barrel. This takes the form of a slight construction which varies in degree in different weapons. To describe this, such terms as 'full choke' and 'half choke' are used. In certain weapons there is no 'choke' device. If a shot is fired close to the body surface, up to a few inches, the shot enters as en masse, and in addition the liberated gases and flame lacerate the tissues, which show evidence of burning, carbon deposit, and powder tattooing. The wads may be forced into the wound, and this may prove an important clue to the class of cartridge used. When the gun has been fired at from 1 to 3 feet from the body, a more or less irregularly circular wound about 1½ to 2 inches in diameter will be produced.

There will be evidence of some degree of the scorching, carbon deposit, and tattooing. So far as dispersion is concerned, with a 'half-choke' gun the pellets will show a spread of about 5 inches in diameter at a range of 5 yards, about 12 inches in diameter at 10 yards, about 16 inches in diameter at 15 yards, and about 20 inches in diameter at 20 yards. To determine the dispersion at the same ranges with a gun of 'full choke' an approximate method is to deduct a quarter from the measurements of these diameters of spread. At a range of over a yard and up to about 3 yards, evidence of burning disappears and probably only faint tattooing will be found. Beyond a yard, the entering shot produces an irregular wound, and, as the result of commencing dispersion of the pellets, individual pellet holes may be detected.

When the smokeless powder is used, blackening and tattooing will be less marked at all ranges than with black powder.

Accurate estimations of the pellet patterns at different ranges are not possible, since so much depends upon the idiosyncrasies of individual cartridges. This is due to the fact that the cardboard wad is so frequently dislodged in an oblique fashion that turbulence of the shot occurs within the barrel and thus affects the pellet patterns at other than close ranges. With regard to the size of the area of wounding produced by a sporting gun, almost irrespective of choke, an approximate estimate, at different ranges, may be obtained by using this simple formula:

If X = range in yards, then the diameter of the wounds = (X+1) inches.

It should be clearly understood, however, that the dimension of the area of wounding, as calculated in the foregoing, is that of the cone of the shot spread, measured on a plane perpendicular to the line of fire and upon a relatively flat surface.

Taylor in his famous work entitled "*Principles and Practice of Medical Jurisprudence*" (1965 Edn.), states at p 283:

Shotguns fire a charge of lead pellets which, if fired from a full 'choked' (narrowed) cylinder spread to a pattern which, measured in inches, is about the same as the distance in yards.

And again at p 295—

As the amount of 'choke' or narrowing of the bore is of importance in keeping a shot charge together, it is vital to know which barrel has been fired. Discharges from unchoked barrels may begin to spread at 2 or 3 feet from half-choke at 3 or 4 and full-choke at 5 or 6 feet.

At p 296 he adds—

Whatever the nature of the charge or projectile, a portion of the powder always escaped combustion at the time of discharge and each grain then acts like a minute projectile, contusing the skin, producing ecchymosis and often lacerating it if the weapon is fired at a close range. The clothing may be burnt, and the skin scorched by the flame of hot gas, and particles of powder may be actually driven into the skin causing 'tattooing'. Powder marks are more easily seen when the older black powder is used. Smokeless powders are more completely burnt, and leave, as a rule, less deposit. The grains being colourless are less easily detected, and may entirely escape observation unless a hand lens is used. We may assume that marks of burning, or blackening, or of tattooing from powder indicate that the weapon was fired from a near distance, certainly within arm's reach.

All the three authors above quoted appear to unanimous that in judging the distance from which a firearm was discharged, the appearance and nature of the resultant wound cannot be said to afford a sure criterion and that any deductions based thereon would lead at best to a very rough estimate.

We have given our most careful consideration to the medical evidence in the light of the above quoted authorities on medical jurisprudence, the deposition of Dr. B.R. Sharma and the contention of Mr. Sibal and our conclusion is that the latter cannot prevail and that the opinion of the ballistic expert, substantially in accord as it is with the said authorities, deserves acceptance. It is true that if the edges of the wound covered by injury No. 2 were found charred, that injury could not have been caused by the same shot from which resulted injuries Nos. 1 and 4, these two injuries, according to Dr. Sharma, having been the result of fire from a range of 3 to 8 feet. It must be held, however, that it was the contusing effect of the impact of the projectile or the dirt ring around the wound covered by injury No. 2 that was mistaken for charring; for, as pointed out by Dr. B.R. Sharma (C.W. 1), injuries Nos. 2 and 3 could not have been caused by a separate shot inasmuch as such a shot would have produced a larger entrance wound and should also have resulted in more than one exit wounds. The dimensions of the wounds covered by injuries Nos. 2 and 3 unmistakably indicate that these wounds were caused most probably by a single pellet and such a pellet would properly be relatable to the shot which caused injury No. 1. In this connection reference may be made not only to the proximity to

each other of injuries Nos. 1 and 2 but also to the fact that only two pellets were recovered from inside the head of the deceased, a fact indicative of the rest of the charge from the shot not having gone into the entrance wound covered by injury No. 1, even though the wads were all recovered from the occipital region. These factors, about the existence of which there can be no doubt, show that the charge did not enter *en masse* but had spread to some extent at the stage of impact and are incompatible with the existence of charring in the case of injury No. 2.

It further clearly appears that the "small pellet" which the doctor (P.W. 2) claims to have found embedded in the centre of the three wounds comprising injury No. 4 was nothing more than dried blood and all the pellets which had caused these wounds had skipped the shoulder. This follows not only from the fact that only pieces of dried blood (and no pellet) are contained in the relevant phial but also from the relative position of the wounds on the shoulder part of the shirt of the deceased. And if this be so, it cannot be said that the pellets, which caused the three wounds just above-mentioned had lost most of their momentum by the time they struck the deceased and had, therefore, been fired from long range.

And once this conclusion is reached and the charring part of injury No. 2 is ignored, no improbability attaches to injuries Nos. 1 to 4 having resulted from a single shot. If the ammunition used by the assailant was an L.G. cartridge and the victim's face was turned towards the left, his shoulder being the part of the body nearest to the muzzle of the gun, part of the charge (three pellets) could well have grazed the shoulder and ran past it through the shirt, another pellet could have gone into the left cheek and out at the seat of injury No. 1 along with the wads, breaking the jaw and getting lodged, after deflection, in the occipital region; so that in such a situation injuries Nos. 1 to 4 would be just the injuries that would result.

Insofar as injury No. 5 is concerned, we have not the slightest hesitation in holding that the doctor's opinion about the diameter of the missile which caused it being an inch or so, is wholly unreliable; nor has Mr. Sibal been able to give us the description of any weapon from which such a missile was likely, in the circumstances of the case, to have been discharged. On the other hand, as pointed out by Dr. B.R. Sharma (C.W. 1), the injury could have been caused by fire from a shotgun, the range being such that the charge would enter *en masse.* It is no doubt true that according to Dr. Sharma, the injury should have been marked by tattooing and blackening. But then we are not very sure if the doctor (P.W. 2) conducted the autopsy with such care as not to have missed noticing tattooing and blackening in the case of injury No. 5 if it was actually there; nor are we convinced that tattooing or blackening was really present in the case of injury No. 5 such as may have been capable of detection by the naked eye. As pointed out above in one of the passages cited from Taylor's work, marks left by unburnt smokeless powder which is colourless are less easily detected "and may entirely escape observation unless a hand lens is used". It has also to be borne in mind that the charge would enter *en masse* and produce a wound of the type of injury No. 5 even if the shot causing it is fired from a range of about 6 feet provided the barrel used is a full-choke barrel and in such a case the chances of the presence of detectable tattooing may not be very bright. In this view of the matter we hold that injury No. 5 could well have been caused by a charge proceeding from a shotgun and that the recovery of only a single pellet such as could have formed part of that charge from inside the body of the deceased is attributable only to the autopsy being not as thorough as it should have been.[1]

8.21.44 Carrying Gun[95]

Though both the courts found on facts that the petitioner has committed an offence under section 27 of the Arms Act, I am unable to agree with the same. It is very doubtful whether the

95. Re *SS Sundaram (),* 1975 Mad LW (Cri) 6 : 1975 Cr LJ 1196 (Mad).

petitioner was armed with a gun at all the time of the occurrence. The petitioner has clearly stated in his statement that there was a wordy quarrel at the time of the alleged occurrence and that P.W. 1 had falsely implicated him as if he was armed with a gun and attempted to shoot him. One clinching circumstance rendering the version of the revision petitioner probable is that if he really had a weapon, P.Ws. 1 and 2 who claimed to have over-powered the petitioner when he was alleged to have attempted to use the gun, could have seized the gun also. P.Ws. 1 and 2 would not have allowed the petitioner to go away with the gun when they would say that they had over-powered him. The gun was seized subsequently only from the house of the revision petitioner. I am unable to accept the evidence of P.Ws. 1 and 2 in this case that the petitioner was armed with the gun at the time of the incident. On this point alone, the petitioner will be entitled to an acquittal.

Even assuming that he had a gun at the time of the occurrence, since both the courts found that he had not used the gun, it cannot be said that he was carrying the gun with the intention of using the same for an unlawful purpose. When the purpose for which the gun was said to be used is negatived, the question that the gun was taken with the intention of using it for an unlawful purpose does not arise. Therefore, the conviction and sentence imposed on the petitioner are set aside.[1]

8.21.45 Dispersal of Shots[96]

1. The third contention was the one which Mr. Dixit elaborated. His proposition was that the medical testimony contradicted the eye-witnesses' version and that contradiction rendered their account unacceptable. According to Dr. Ghosh's evidence, none of the three entry wounds showed any blackening or tattooing. Obviously, therefore, the firing did not take place from a very close range but from some distance at least. No doubt, the three eyewitnesses gave different distance ranging from two to six paces. But they could hardly be expected to have marked at the time the precise distance at which the person shooting the firearm was. They, therefore, gave an estimate of the distance at which he was from the victim. It is a wonder that the distances they deposed varied. Nothing can, therefore, turn on such variation.

2. But counsel pointed out that injury No. 1 showed six entry wounds in the left back, injury No. 5, four such entry wounds in the thigh and injury No. 7 in the left leg, one such entry wound. According to him, therefore, eleven pellets had actually hit various parts of the deceased's body, which fact must indicate the extent of dispersal of the shot. He suggested that considering the area of dispersal the shot could not be single shot as deposed by witnesses, and secondly, that it could not have been fired from a short distance also deposed by them. In particular, he relied on the observation by the trial court that an S.G. cartridge contains nine pellets only and, therefore, the fact that the three entry wounds were caused by eleven pellets clearly suggested that there must have been at least two shots fired and not one. He also emphasised that the area of dispersal from the victim's back to her left leg also suggested that it could not have been one but two shots which could have caused all the three entry wounds with eleven pellets having caused eleven injuries at three different places. In support of his theory, he relied on the finding by the police (Ex. Ka 10) of five tiklis of cardboard and one flattened round shot at the well which according to him was again indicative of more than one shot having been fired at. It is clear that the entire argument was based on the assumption of a wide dispersal of the shot.

The facts of the case and the evidence on record, however, do not support the assumption. The three entry wounds, besides the account given by the eye-witnesses, clearly established that the deceased was shot in her back from behind. If she was sitting, as described by the eye-

96. *Janak Singh v State of Uttar Pradesh*, AIR 1972 SC 1853 : (1973) 3 SCC 50 : 1972 Cr LJ 1177.

witnesses, in a crouched position, her back, her left thigh and her left leg would more or less be, as already stated, in a perpendicular line. It will be noticed that injuries (v) and (vi) are entry and exit injuries *prima facie* indicating that the pellets which entered into the victim's left thigh penetrated through and through. The same is the position with regard to injuries (vii) and (viii) on her left leg. Two alternatives thus suggest themselves. Either that the same pellets which went through her left back (entry wound No. (i) and came out through the chest (exit wound No. (ii) hit the thigh and the coming out through and through also penetrated her left leg, both of which were in a line, or the three parts of her body were not in a straight line and different pellets dispersed from the shot penetrated the three limbs independently of each other.

In the case of the first alternative, there would be no question of a wide area of dispersal. In the case of second alternative, also, the dispersal would not be in any wide area. The site plan produced by the prosecution also makes it clear that there could not have been much distance between the victim and her assailant and, therefore, there was not much scope for any large dispersal of the shot. Such a conclusion is in harmony with the doctor's evidence, the places where the pellets entered into the victim's body and the evidence of the two eye-witnesses. It is true that in all at least eleven pellets entered into the victim's body at three places. The trial court observed that an S.G. cartridge would contain nine pellets. But as the High Court observed that was a personal observation made by the court without any such evidence. There was no evidence to show that the cartridge in question was an S.G. cartridge. No argument can thus be founded on an assumption that the cartridge was an S.G. cartridge. The police found five tiklis but they could be cardboard tiklis in which the pellets must have been packed. Their seizure by the police at the spot could not solve the question whether one shot was fired or more. Likewise, in the absence of evidence as to what kind of pistol was used by the assailant, passages cited by counsel from works on firearms can hardly be of any relevance. The fact of the matter was that the eye-witnesses were emphatic that it was the appellant who fired at the deceased with an improvised pistol, and that he fired once only. That evidence was backed by the opinion of Dr. Ghosh who equally emphatically opined that all the six gunshot injuries could be caused by a single shot. That evidence was acceptable to both the courts and nothing has been substantiated before us which can justifiably impugn that evidence. Counsel could raise only conjectural alternatives against the eye-witnesses' account as to how the incident occurred. Such conjectural alternatives cannot be substituted in place of accepted evidence of those who actually saw the incident.

8.21.46 Correct/Incorrect Inference[97]

1. During the course of investigation seven cartridges were recovered at the place of occurrence. One empty cartridge and one misfired 12 bore cartridge were found near the dead body of Tota Singh. Five empty cartridges were found lying on the southern Chabutari where Murti was washing clothes. A licensed DBBL gun was recovered at the instance of Gurdas Singh. An SBBL gun was recovered on being pointed out by appellant Bawa Singh. Four of the cartridges, according to the evidence of the ballistic expert, P.W. 13 Dr. M. Johari, had been fired from the single barrel gun recovered at the instance of Bawa Singh. Dr. Johari was definite that misfired cartridge was neither from the double-barrel gun of appellant Gurdas Singh nor from the single-barrel gun of appellant Bawa Singh. This clearly established the use of a third gun in the occurrence as was the prosecution case. Dr. Johari could not give any definite opinion about the other two empty cartridges as to whether they were fired from the DBBL gun of appellant Gurdas Singh. The findings of the ballistic expert and exemption of two persons from trial did create some confusion in the prosecution evidence and perhaps led the witnesses to make some changes or embellishments in their evidence.

97. *Gurdas Singh v State of Rajasthan*, AIR 1975 SC 1411 : (1975) 4 SCC 490 : 1975 Cr LJ 1218.

Nonetheless as found by the courts below, in material particulars the evidence of the eyewitnesses was trustworthy, credible and truthful.[1]

8.21.47 Sequence of Events[98]

1. It may be mentioned here that the site plan, relied upon by the High Court to give 7 feet as the distance between the door and the place on the sofa where Thakar Singh was sitting, was prepared by a draftsman, Bakshi Singh, P.W. 10, on 24 February 1970, at a time when the sofa was not there at all. He admitted that he had shown the sofa and its distance from the door only on enquiry from the investigation officer. We do not think that such a statement could be admitted in evidence. Moreover, even if we assume, for the sake of argument, that this distance was 7 feet and, also that there was a chick, as deposed by the witnesses, the shooting could easily take place from a distance of 6 feet by inserting the barrel of the gun by the side of the chick and taking aim while taking the cover of the wall adjacent to the door. Dr. G.S. Gambhir, the Medico-legal expert, who had performed the post-mortem examination, said, after looking at the injuries of Thakar Singh:

> *These injuries were caused when the nozzle of the gun was at a distance of about 6 feet from the body.*
>
> *These injuries could not be caused if the nozzle was 4 feet away from the body. By nozzle I mean 'muzzle' of the gun barrel.*

He also said:—

> *When the distance is less than 4 feet or 4 feet, the pellets enter the body* en masse. *If the distance is more than 4 feet, then the pellets will spread and will enter the body within a diameter of 2 inches from the main hole. In the present case there are three separate openings adjacent to injury No. 1 and there were four small openings around the second injury. I have not noted the exact distance of the various openings with regard to injuries Nos. 1 and 2. Upto a distance of 3 feet the pellets do not spread. My opinion is based on Modi's* Medical Jurisprudence.

The following injuries were found on the body of Thakar Singh:

> *One circular wound about 2" in diameter with lacerated margins on the front of the chest, slightly on the right side of the middle line. There were three small separate openings adjacent to the main wound. One circular wound about 1½" in diameter with a lacerated margin over the left shoulder joint. There were four small openings adjacent to main wound.*

These injuries show that Thakar Singh's back was probably turned towards the door when he was first hit. Perhaps that is why he was first struck on his left shoulder joint. He must have turned slightly after the first shot. Hence, the other injury is on the front of the chest on the right side. If the assailant had actually entered the room and shouted "Thakar Singh" and shot, the injuries would be right in front. In that case, there could have been no injury on the left shoulder joint. It may be mentioned here that the F.I.R. lodged by Joginder Singh does not mention that the assailant had shouted 'Thakar Singh' before shooting at him. He admitted this omission but gave no explanation for it.

Medical evidence also revealed that there was no blackening, tattooing, scorching, charring or singeing around the main wounds. It was, therefore, contended before us that the shooting must have taken place from a distance of more than 4 feet. The High Court had explained the absence of blackening and charring by observing that the cartridges inside the gun bore the word "smokeless" and opined that the shooting need not have been from a distance of more than 4 feet. It seems to us that the High Court had assumed that the cartridges found in the gun were actually of a kind which would not cause blackening or charring or singeing and that these were the very cartridges

98. *Datar Singh v State of Punjab*, AIR 1974 SC 1193 : 1974 Cr LJ 908.

used by the murderer. The requirements of a technically proper proof were wanting on this point. The ballistic expert, called in as a defence witness, was not even questioned on the point.

Here, we may refer to the evidence of ballistic expert Shri J.K. Sinha, D.W. 10, Assistant Director of the Forensic Science Laboratory, who was not produced by the prosecution probably because he had made a report showing that it was not possible to connect the cartridges with the gun as the impressions made by the hammer was too indistinct. The gun was proved, from its licence, to belong to Mohan Singh, the son-in-law of Thakar Singh. It was not sent for examination of any fingerprints on it. Had there been such evidence of the appellant's fingerprints on the gun, it would have furnished strong corroborative evidence. In the circumstances of the case, we find it difficult to link the gun with the actual weapon with which the murder was committed. It is not inconceivable that it was left deliberately outside by someone to confuse the investigating authorities.

8.21.48 Location of the Shooter[99]

The various matters mentioned in the judgment of the High Court on the question "whether the shots were fired from inside the drawing-room or from outside" are so convincing that one could not but come to the conclusion that the shots were fired from inside the drawing-room and not from outside. The various findings of bullet marks on the wall, the calendar, the door pane in the light of the evidence of the ballistic expert did not leave any scope for even a shadow of doubt that the doctor was hit by a gun fired from inside the drawing-room. The assailant at the time of firing was not and could not be visible to persons outside as the shots were fired from a place inside the drawing-room which was south-east of the western door. And that is the reason that Kalika did not say that he saw Shamim firing the shots at Gautam. He merely deposed to the fact of the former proceeding to the western room immediately after the firing. It may also be added that the fact that the shots were fired from inside the drawing-room was neither disputed in the High Court nor before us.

For the reasons stated by the High Court in its judgment, we unhesitatingly endorse its view that the shots were fired from the 20 bore DBBL gun which was recovered from the eastern room and the licence of which was in the name of Sikandar Jahan, stress was laid before us that P.W. 14, Sia Ram Gupta, the ballistic expert, had deposed with reference to the two empty cartridges found at the spot that the shots could have been fired from the 20 bore DBBL gun of Sikandar Jahan: the expert was not definite about it. We find no force in this.

8.21.49 Location of pellets and empty cases[100]

It is particularly submitted that the location of the pellets and the empty cases belies the story of the prosecution. The Court has not found any merit in this submission. It has come in evidence that the accused fired a few shots, including those which injured the person and caused the death of the deceased. The distance between the place where the incident occurred and the places at which the pellets/ cases were found is not so large as to create any doubt with regard to their placement. Pertinently, the witness-Senior Scientific Officer-cum-Ex-officio Chemical Examiner, FSL Rohini, Delhi, who examined the pistol and the bullets/ cartridges was not cross-examined on behalf of the accused, and it was not suggested to him that the empty case/ pellets could not have been found at the locations and they were actually found and shown in the scale site plan, in the natural course. It goes without saying that when a fire arm is used in a situation of the kind arising in the present case, the direction in which the pellets/empty cases/ cartridges may fall need not result in a predictable pattern.

100. *Anil Kumar v State*, 2018 (4) ADR 168.

8.21.50 Contradiction and Conflicting Versions[101]

The High Court noted that a number of contradictions were pointed out in the account given by the eye-witnesses P.W. 3, P.W. 4, P.W. 5, P.W. 6, P.W. 7, and P.W. 31 and that the prosecution has not been able to explain the injuries which Nadar had on the palms of his hands which injuries, according to the High Court, indicated that he was protecting himself against gun fire. It is also observed that the contradictions were not minor as they related to the spot of the murder, the fields through which the accused passed and the manner in which the killing took place. There is also the question of incompatibility with the medical evidence regarding the distance from which the gun was shot and the way it was shot. It was of the view that the incised wounds were more likely to have been caused after death and the likelihood of a false story of knives of the assailant cannot be ruled out. As regards firing of a pistol, there is absolutely no corroboration and the evidence was characterised as a myth. The hole in the shirt could have been only caused by the firing of the pistol and nothing collected on the spot showed that Sohrab fired a pistol or he fired a pistol on Sobalsingh. The story of the pistol was, therefore, discarded. Notwithstanding these findings, the High Court found that there was unanimity in the evidence of all the witnesses that Sohrab fired the fatal shot or shots with a gun given by Nadar. This was corroborated by the medical evidence which indicates that the injuries on the deceased were due to gunshot injuries. There is also the evidence of the incident having taken place in a field in which the deceased was found and there was unanimity on the point that Nadar handed over the gun to Sohrab and Sohrab fired a shot on Sobalsingh who fell down after which a second shot was fired. The version of the accused that the gun shot injuries were caused accidentally will not be believed. The defence story that Nadar was easing himself when he was attacked all of a sudden after which a scuffle between Sohrab and Sobalsingh took place resulting in the accidental firing of the gun was difficult to be comprehend. The High Court however dealt with the several contentions urged in respect of the story that Nadar had handed a gun to Sohrab which he could have easily fired himself or that Nadar who is said to have caught Sobalsingh from behind should have been the first to have been injured, or that the directions of the injury on Sobalsingh indicates that the firing was from below when Sohrab was at a higher level, or that the witnesses could not have been seen from the place where they were or that Sohrab fired at Sobalsingh, or that he fired it when its barrel was at a distance of 11/2 cubits from Sobalsingh were all discussed, but they were not considered to throw any doubt on the main version of the eye-witnesses that it was Sohrab who had fired the gun while Nadar held the deceased. The conclusions of the High Court have been set out as under:

> *The argument that the shooter should have been at a level lower than the victim and such a state has not been told by witnesses. Rather the story clearly excludes such a possibility has, no doubt, some merit if we accept the story of the prosecution witnesses as told by them. We do not fully accept the same. In fact they saw the incident from a distance and the detailed descriptions are all inferences as even admitted by one of them. A man running for life and a mere following would be away quite far from the witnesses. The number of fields mentioned by the witnesses intervened the witnesses and the spot. In fact it has been a point taken up by the defence that on account of the distance they could not see. What we feel is they could see the broad facts, Sohrab's running on a mare, broad and easily visible actions that one could see from a distance. The rest of the details are imaginations and inferences. Nadar's injuries on his palms cannot be explained strictly on the basis of the prosecution version; but as we have seen the details are unbelievable, we can only say the witnesses could not see how the injuries on Nadar's palms were received. They were received undoubtedly on the spot and when gun was fired, Sobalsingh was no doubt held or appeared to have been held by Nadar from a distance. He must have tried to move, that moment was responsible for injury to his palms. The unassailable story, therefore, remains is that Sohrab fired a gun at Sobalsingh and Nadar handed over the gun to him. Both of them are, therefore, guilty.*

101. *Sohrab v State of Madhya Pradesh*, AIR 1972 SC 2020 : (1973) 1 SCR 472 : 1972 Cr LJ 1302.

8.21.51 Accidental shooting[102]

Harish Chander expressed a desire to see how the pistol is fired. The accused took out the pistol from his pocket and after removing the magazine from the pistol placed it on the bed. Harish Chandra asked him if the weapon was ready to be fired and the accused replied that there was a bullet inside. The accused took out the bullet and then demonstrated to Harish Chandra how the pistol is used. Harish Chandra also took the pistol in his hand and pressed the trigger by pointing it towards the roof. Harish Chander handed back the pistol to the accused who after loading it with the bullet and magazine, put it in the pocket of his pant. In the meantime, Nirmal Kanta entered the room and she also desired the accused to demonstrate how the pistol is fired. The accused again removed the magazine from the pistol but omitted to take out the bullet. He fired the pistol by aiming it at the deceased. The bullet hit the deceased in the forehead. On receipt of the bullet injury Nirmal Kanta fell to the ground. It is alleged that Lalita had also in the meantime come into the room. Lalita asked Harish Chander to call Asha Rani, mother of the deceased, who reached the spot within a few minutes. Nirmal was removed to the Irwin Hospital where she succumbed to the injury on 8 September 1970.

The post-mortem on the dead body of Nirmal Kanta was performed on 8th September by Dr. Vishnu Kumar (P.W. 1). He found an oval wound 0.5 cm. x 0.4 cm., width 0.2 cm. on the front of the middle of the forehead 1.8 cm. above the bridge of the nose. The doctor gave the opinion that the pistol had been fired from a distant range because there was no singeing, blackening or tattooing around the above injury. He also gave the opinion that the above injury was sufficient in the ordinary course of nature to cause death.

The accused in his statement at the trial admitted his marriage to Lalita Devi. He also admitted that he has a son named Rajinder Kumar from his first wife. The accused denied that on 5 September 1970 he had gone to invite Harish Chander and Nirmal Kanta for a game of cards but stated that they had decided to go for a picnic on the following day, that is, 6th September. He further admitted that on 6th September at about 10 am. Harish Chander and Nirmal had come to his house. The accused admitted that the pistol Ex. p 1, the magazine Ex. p 2, the cord Ex. p 3 and the fired bullet belonged to him. The accused stated that he had taken out the pistol from his almirah and placed it on the cot. The accused admitted that at the request of Harish Chander he had demonstrated to him as to how the pistol is used. The accused stated that before Nirmal Kanta had come into the room he had placed the magazine and the bullet inside the pistol and put it on the cot. The accused stated that Nirmal Kanta had requested Harish Chandra to show to her as to how the pistol is fired and that Nirmal Kanta had received the bullet injury while Harish Chander was demonstrating to the deceased as to how the pistol is fired. The accused admitted that Nirmal died as a result of the bullet injury.

Soon after the occurrence Sewa Ram had gone to the shop of Krishan Gopal (P.W. 9), and told him that one girl had shot herself in his house. Krishna Gopal informed the police of the occurrence as told to him by the accused. The accused did not stick to this version at the trial it appears advisedly, for the medical evidence showed that the pistol had been fired at from some distance. Before the committing magistrate the plea taken by the accused was that it was Harish Chander who had killed Nirmal Kanta accidentally.

On a careful perusal of the testimony of Harish Chander and P.Ws. 4 and 5 we are of the view that there is no clear and convincing evidence on the record with regard to the alleged motive.

---

102. *Sewa Ram v State*, 1976 Cr LJ 242.

8.21.52 Murder, not Suicide[103]

In the background of the above contentions, it is unnecessary to go into a detailed discussion as to the manner of death or the nature of weapon used for the purpose. It can be safely presumed that the deceased met her end at the alleged time and place from a gun shot fired from M.O. I. with the cartridge M.O. II. Suffice it to say that the doctor who held the post-mortem found one circular wound 1½" in diameter situated in the right flank below the rib margin of the right side, 6" from the spine and 11" from the shoulder in the midaxillary line. The surrounding skin was blackened and scorched. A small lacerated portion of the liver tissue was protruding. The wound was 6" deep and its direction was horizontal to the foot. Besides these, there was an ecchymosis 2" x 1" x 1" behind the elbow joint of the right arm. On dissection, the material things that he found within the wound were six pieces of round cardboard and eight pellets from the liver tissue, which were sent to the investigating officer. These were examined by P.W. 3, the ballistic expert according to whom, the gun was fired from an approximate distance of 3 to 4 feet from the victim, and that angle of firing was approximately little over right angle to the surface of the body. The ecchymosis was explained to be due to fall after receipt of gunshot.

P.W. 3 is the ballistic expert and his report, Ex. 6, shows that the gun, M.O. I was in good working order and that the residue from the right barrel indicated that M.O. II (the empty cartridge) had been fired from that barrel of the gun. To certain suggestions indicating a case of suicide he has in his cross-examination negatived the theory when he stated that in view of the site of the injury and the angle of fire it is not possible that the injured could have shot herself to death. He further stated in cross-examination thus:

"A person with longer arms than myself may be able to shoot the gun, M.O. I, at himself.

If the gun, M.O. I, is firmly placed in position and then the trigger pressed by manipulation with a stick-like-article, it might be possible to shoot oneself".

But such a contingency can be safely ruled out in view of the positive evidence in the case that the gun had been placed in a Khatuli (small charpoy) *i.e.*, in its original position along with the rifle and the barrel was not towards the direction of the deceased. Further the cartridge, M.O. II, after firing, had been taken out from the magazine and placed on the table nearby. Such a situation is only possible when the assailant, after firing the shot, had enough time first to extract the cartridge and then place the gun and the empty cartridge in their respective places along with such other articles of the house as was found by the investigating officer.

The statement of the investigating officer concerning materials is thus:

> *I found that the double barrel gun and a rifle had been placed on a Khatuli 3½ feet from the head of the deceased. M.O. I is that gun, and M.O. IV is that rifle. The muzzles of both the guns were pointing towards the east. I also found that two 12 bore empty cartridges had been placed on a table over the khatuli and one of those cartridge cases smelt of gunpowder indicating recent firing. M.O. II is that cartridge case smelt of gunpower. There were two other 12 bore live cartridges lying on the table. The overshot wad, M.O. III was laying to the side of the dead body in line with the gun shot wound on the dead body. I seized the gun licence, Ext. 10 on production by the accused and some other live cartridges which were inside a locked box,* vide *seizure list Ext. 11.*
>
> * * * * *
>
> *At my bidding the accused had himself opened the lock of the box.*

8.21.53 Presentation[104]

It is further clear that the recovery was not made from the residential portion but from the place where cattle are tied, and the fodder is kept. The object was admittedly hidden from human gaze. The accused has farm-servants. It cannot be presumed that the place is not accessible to these farm-servants especially when it is a place for tying cattle. The exact location and its distance from the gate are not clear from the record. Under these circumstances, it cannot be held that the thing hidden at a place accessible to others in the house inhabited not only by A-I but also by another was in the conscious or voluntary possession of accused.

It was the duty of the prosecution to prove against the accused that M.O. II belonged to him, that he had secreted it or that he was in actual possession of the thing recovered. The mere physical presence of the accused in proximity to the object cannot by itself be an incriminating circumstance unless it can be held that he was in conscious and intelligent possession of that object. Merely because he is the head of the joint family or the owner of the house, he cannot be credited with constructive knowledge of a hidden thing. Possession must imply knowledge and there would be no possession when there is no knowledge.

It requires no elaborate argument to state that possession without knowledge lacks the element of *mens rea* or criminal intention which is essential for an offence. It cannot also be said that the weapon was under the control of the accused within the meaning of the Arms Act. "Control" under the Arms Act means that the accused must have power over the weapon so that he can direct its custody, production, use or disposal in some manner. Thus, in the instant case, it cannot be held that the said improvised smooth bore firearm which was lying buried in the manger at a place accessible to others was in the conscious or voluntary possession and control of the first accused. The offence under section 19(f) of Arms Act, is not, therefore, made out against him.

The prosecution has relied on the report of the Chemical Examiner and the expert evidence of P.W. 38. The report of the Chemical Examiner is to the effect that the barrel washings of the pistol (M.O. 2) were examined and the combustion products of the smokeless powder in them were detected, though the time of firing could not be stated. The Chemical Examiner has further stated that he examined the margins of the rents of item X and the scrappings from item XIII for products of combustion of gunpowder but he did not detect the products of combustion of gunpowder in either various items with the assistance of the firearm expert of the Crime Branch C.I.D., Madras are that:

(i) Item XII (M.O. 2) is an improvised pistol capable of firing a 12 bore cartridge and is in working order.

(ii) M.O. 7 was fired from M.O. 2.

(iii) M.Os. 8 to 10 could have formed part of 6 size 12 bore cartridge like M.O. 7 and could have been discharged from the same; and that

(iv) The pellets recovered are of No. 6 size and the pistol was discharged from a distance of 6 feet which can be concluded, having regard to the injuries described in the post-mortem certificate.

P.W. 38 in his deposition states that he fired a test cartridge with M.O. 2 and compared the pin-mark on M.O. 7 with the aid of a comparison microscope and he found agreement in shape and other finer striations and, therefore, he was of opinion that M.O. 7 was fired from M.O. 2. As regards M.Os. 8, 9 and 10 he states that they could have formed part of M.O. 7 and could have been discharged from it. He further states that the barrel washing of M.O. 2

104. *Kodur Thimma Reddi* (*Re)*, AIR 1957 AP 758 : (1957) 2 Andh WR 156 : 1957 Cr LJ 1091 (AP).

was taken and the combustion products of smokeless powder were found but the exact time of firing could not be stated. In cross-examination he says he did not take any photos of the pin-points, that a similar cartridge like M.O. 7 could be fired in a revolver of the same bore, even if hand-made, will have its own individual characteristics, in casting the pin-marks.

In scientific criminology the main principle of forensic ballistic is to establish whether a given bullet or cartridge was used in a particular weapon. The scientific knowledge during the past thirty years in this regard has advanced considerably. It is now possible not only to tally the cartridge fired with the gun used but a number of other important facts can be decided though with varying degrees of probability. Among these are the distance from which a shot was fired, the approximate time when the weapon was last fired and other questions of similar nature. These are all the questions that require a solution in the present case. As pointed out above, the cartridge was not found at the place of occurrence. But, it was at altogether a different place.

It is necessary that it should be first connected with the pellets that were ejected and then with the weapon that discharged the same. This is possible if not only the time of firing M.O. 2 tallies with the time of the incident but also the thumbprints of the gun on the cap and base of the cartridge tally with those found on the disputed cartridge and further the pellets are traced to the firearm in question. The conclusions of the firearms expert and the chemical examiner in this particular case do not take us far in the murder. So far as the pellets are concerned, the results arrived at by the firearms expert do not appear to be conclusive.

They only seem to bear the impress of a mere probability though with regard to the pin strike and finer striations on the base or the cap of the cartridge the opinion expressed seems to be definite and conclusive. But, unfortunately, he has not produced the test cartridge for comparison purposes. The learned advocate on that account has argued that unless the data be supplied or the enlarged photos be produced so that the opinion of the expert may be verified by the court, the court ought not to accept the opinion of the expert without satisfying itself of the correctness of the same. Reliance has been placed in *Balija Pullayya (Re)*, 42 Cr LJ 316 : AIR 1941 Mad 88 (I) ; *Harendranath Sen v Emperor*, 32 Cr LJ 1001 : AIR 1931 Cal 441 (J) and *Fakhruddin v State of Madhya Pradesh,* AIR 1967 SC 1326 : (1967) 1 SCWR 449 : 1967 Cr LJ 1197.

We feel that the test cartridge ought to have been sent to the court so that the court could be satisfied of the identity of the thumbprint of the gun on the breech face of both the cartridges.

As we have observed above, forensic ballistic concern with investigation of firearms and ammunition and of problems arising from their use for purposes of legal evidence. The firearms can be broadly divided into two main classes: (1) smooth bore arms; and (2) rifled arms. In the first comes the shotguns or the firearms like M.O. 2. M.O. 2 cannot be confused with an automatic or self-loading pistol which ejects the empty cartridge at the spot nor with a revolver which has a rotating magazine called cylinder.

Whatever its size, M.O. 2 is only a smooth bore improvised firearm. The rifles, revolvers, automatic and self-loading pistols and machine guns fall under the above-mentioned second class. The barrel of the second class being furnished with spiral grooves imparts spin to the bullet, thereby giving not only accuracy and penetrating powder but also the markings and the other characteristics of the barrel which carry individual peculiarities.

But, shots discharged from a smooth bore firearm scatter over an area that increases roughly according to the distance of the target from the gun, and besides these missiles do not bear the individual characteristics of the barrel so effectively as in the rifled arm. That is the reason why the pellets from a shot-gun, though can be measured, weighed and subjected to chemical analysis, cannot establish the identity of the gun that fired them though in the case of bullets

from a rifled arm the identification of bullets is possible with the help of a microscope and expert's services.

Lemoyne Synder in his book on *Homicide Investigation* at p 100 discussing the bullets from a rifled arm states as follows:—

When a lead bullet is fired through this barrel, these characteristics of the gun barrel will be transferred to the sides of the bullet so that bullets fired from a certain barrel will have characteristics which are peculiar to that particular firearm and to no other. In like manner other machine parts of the mechanism, such as the firing pin, extractor pins, the breech facing will likewise impart marks to the primer or shell which are characteristics of that particular weapon and to no other.

Thus, it is possible, when a bullet is found, in a dead body or any empty shell near where a gun is fired, to tell whether that bullet or shell was fired in any particular weapon which may be suspected of having fired the fatal shot.

C.J. Poison in *The Essentials of Forensic Medicine* at p 166 with regard to shotgun missiles states that:—

> *The pellets from a shotgun can be measured, weighed and subjected to chemical analysis, although the results have a relatively limited value.*

Thus, in this particular case where the pellets have been discharged from a smooth bore barrel firearm the expert's opinion cannot take us far. The pellets unlike the bullets do not bear the impress or the characteristic marks of the barrel of a particular weapon which distinguish them from those of the barrel of any other like a weapon.

The size of the pellets alone is not a dependable test not when their actual number is not correctly ascertained can they be in any manner connected with M.O. 7 to any degree of probability or certainty. It must be remembered that even in cases of bullet evidence the expert evidence should come before the court by means of photomicrographs. Nigel Morland in *An Outline of Scientific Criminology* at p 96 under the caption "Court and Bullet Evidence" states:—

> *Expert evidence of the highly technical kind with forensic ballistic deals, is usually presented to the court by means of photomicrographs that show the various significant points of agreement. The preparation of these demands a high degree of skill if all the relevant points are to be brought out and the possibility of error executed. It is a tribute to the way in which such work has been handled that, new though forensic ballistics is as compared with other sciences, courts today readily accept its evidence.*

Thus, it is evident that the evidence with regard to the identity of pellets not only labours under inherent want of precision but also is most unsatisfactory. The case of the prosecution that the missiles at the scene of occurrence were discharged from M.O. 2 must, therefore, fail. No doubt, the thumbprint of the gun on the cartridge plays an important part in establishing the identity of the gun provided the suspected cartridge can be connected with the incident, but in this regard too there is no material on record that the trial shots conducted have given the thumbprint of the gun in perfect unison with that on the suspected cartridge, M.O. 7. Lemoyne Synder on *Homicide Investigation* at p 100 while describing figures 32 explains the fired shell in the following manner:

When a cartridge is fired the explosion not only forces the bullet out of the barrel, but with an equal force it drives the shell back against the breech of the gun. The primer, being made of soft metal, will pick up any scratches or tool marks on the breech facing and these markings on the primer will be characteristic of that particular firearm and none other.

Nigel Morland in his book on *An Outline of Scientific Criminology* at p 91 characterises these markings as the thumbprint of the gun and describes them as below:

When a firearm of any kind is discharged, the gases generated by the combustion of the charge have two effects, they eject the bullet from the muzzle with considerable velocity, and they drive back the cartridge against the breech face of the weapon. The pressure with which the latter occurs is sufficient to cause the cap and base of the cartridge, which are of comparatively soft metal, to take an imprint of the breech face, in much the same way as a piece of wax pressed on to a seal takes an impression of the design. It is this imprint which enables cartridges to be identified as to having been fired from a particular gun.

While describing the method of examining cartridges, at p 92 he states as follows:

Broadly, therefore, the method of determining whether a cartridge has been fired from a given gun—often an important factor in crime investigation—is as follows: Several trial shots are fired from the gun it is desired to test. The markings made on the cartridges are compared with those on the suspected cartridge.

By a process of comparison and minute examination according to a fixed plan, identity can be established or disproved with a probability of error so remote as to be entirely outside practical consideration. To put the problem simply, it may be stated thus: the trial shots give the thumbprint of the gun. Has the suspected cartridge the same thumbprint? If it has, identity is established; if not, it is certain that the gun and the cartridge do not 'marry'.

In practice, as would be expected, the matter is not so simple as this and many difficulties and complications arise. To start with not only the marks already mentioned on the base of the cartridge and on the cap, but those on the body, or tubular part, have to be considered. There are others that provide clues, such as the indentation made by the firing pin and by the mechanism for ejecting the spent cartridge. The pressure of the cases formed by the explosion also plays a part in determining the nature of the thumbprint, since, owing to slight differences in the charge as between cartridge and cartridge, certain marks may appear on one cartridge, and not on another. This makes it clear that even the examination of cartridges requires minute care and thorough satisfaction for correct conclusions. The court drawing an inference from the opinion of the expert, therefore, should be satisfied of all these.

This is possible only when the requisite material is brought before it. Evidently but for M.O. 7 which is said to be a suspected cartridge, no test cartridges has been produced before the court so that the identity of the marks on the suspect may be established with the test cartridge. Indubitably, the evidence on record is scanty and does not connect M.O. 2 either with M.O. 7 or with the pellets that were discharged at the place of occurrence. As we have pointed out above the expert has expressed his inability to determine even approximately the time at which the gun must have been last fired. The chemical examiner's conclusion with regard to the range of firing too based wholly on the injuries described in the post-mortem certificate is not much dependable.

The diameter of the area in which the pellets lay is not ascertained for any estimate is based on tests with the suspected weapon. The overshot card or wad may also be a determining factor. But evidently that has not been made the basis for his conclusion. We think it unnecessary to enter into a detailed discussion on this behalf. It is, however, clear that the evidence of the expert or the chemical examiner in this case is of no help in establishing the identity of the pellets with the gun, M.O. 2. Neither M.O. 2 nor M.O. 7 can, therefore, be said to be an incriminating object in relation to the murder of the deceased. Thus, it is neither proved that A-4 or A-1 had owned or possessed M.O. 2 and M.O. 7 nor is it established that these were used for the murder of the deceased.

8.21.54 Insufficient Data[105]

It seems that the learned judges of the High Court were not at all impressed by the evidence of the expert, which they characterised as unsatisfactory and they were not also confident that the gun (Ex. P-16) had been used in causing the injuries to Dalip Singh. This appears from the following observations made by them in their judgment:

> *The gun P-16 was identified by Jita Singh as the gun with which Mohinder Singh fired at him and Dalip Singh but he identified the 'gun' because of a brass plate of its butt end. We have seen the gun. Its brass plate could be of no use for the identification of the gun.*

Again commencing on the nature of injuries found on the body of Dalip Singh:

> *What kind of bullet it was which, though it had blackened the area where it entered the brain showing that it had been fired from not far away, did not shatter the brain, we do not know? What kind of projectile it was, which entered the body (which if the evidence is to be believed it was fired at from a few feet at Dalip Singh) and passed through the body without shattering the inside of the chest or causing extensive damage therein is also not known. Mr. Sethi (counsel for the accused) quoted Taylor's* Book on Medical Jurisprudence *and Hatcher's* Book on Ballistics *and argued that the firing must have been from a place between 800 and 1,200 yards away in order that the projectile may pass through and through the body and not shatter it. That, of course, presupposes that the barrel of the gun (using the word 'gun' in the generic sense) is grooved which caused a projectile to go forward with a rotatory motion of something under a quarter of a million revolutions a minute and travelling at the rate of about 2,000 miles an hour when it leaves the gun. We do not know whether the barrel of this gun (Ex. P-16) is grooved or not. It is a single barrelled gun and is country made. The likelihood is that the barrel is not grooved.*

On a careful reading of the judgment under appeal, it appears that the learned judges of the High Court strongly felt that they had no adequate explanation in the oral evidence before them for certain puzzling features of the injuries on Dalip Singh. This is exactly what we also feel in this case, and it seems to us that the evidence which had been adduced falls short of proof in regard to a very material part when an injury is caused by a lethal weapon, it has always been considered to be the duty of the prosecution to prove by expert evidence that it was likely or at least possible for the injuries to have been caused with the alleged weapon. It is elementary that where the prosecution has a definite or positive case, it must prove the whole of that case. In the present case it is doubtful whether the injuries which are attributed to the appellant were caused by a gun or by a rifle. Indeed, it seems more likely that they were caused by a rifle than by a gun, and yet the case for the prosecution is that the appellant was armed with a gun and, in his examination, it was definitely put to him that he was armed with the gun (P-16). It is only by the evidence of the duly qualified expert that it could have been ascertained whether the injuries attributed to the appellant were caused by a gun or by a rifle and such evidence alone could settle the controversy as to whether they could possibly have been caused by a firearm being used at such a close range as is suggested in the evidence.

It is clear, and it is also the prosecution case, that only two shots were fired at Dalip Singh, and one of the crucial points which the prosecution, had to prove was that these shots were fired in such manner and from such distance as is alleged by the eye-witnesses. There is, in our opinion, a gap in the prosecution evidence on a most fundamental point and the error which has been committed by the courts below is to ignore the gap and decide the case merely upon the oral evidence of three witnesses, two of whom are mere chance witnesses and not altogether independent persons and the evidence of the third witness is open to criticism on the ground of his partisanship as well as the improbability of his having been able to see the firing at his brother after he had himself been shot at the back of the head. The learned judges of the High Court, after commencing upon the entire evidence, say in their judgments:

105. *Mohinder Singh v State of Punjab*, AIR 1953 SC 415 : 1953 Cr LJ 1761 (SC).

We are thus left with the evidence of three witnesses of the prosecution together with the state of wounds as shown by the medical evidence and an unsatisfactory statement of the expert.

They reject the evidence of the expert, and they consider the nature of the wounds to have created a serious difficulty in the case. Having arrived at this conclusion, it was a serious thing to rest the appellant's conviction wholly upon the oral testimony in the case which has remained unchecked and unconfirmed by expert evidence.

The real position appears to be that the prosecution case cannot be said to be wholly proved but only partly proved if it is permissible to use such an expression. This court, as was pointed out in *Pritam Singh v The State*, will not entertain a criminal appeal except in special and exceptional cases where it is manifest that by a disregard of the forms of legal process or by a violation of the principles of natural justice or otherwise substantial and grave injustice has been done. It seems to us that the present case comes within the rule laid down because the appellant has been convicted notwithstanding the fact that the evidence is wanting on a most material part of the prosecution case.

8.21.55 Probable and Categorical Evidence[106]

According to the prosecution case Swaran Kaur, the aunt of the appellant, was standing behind Dial Singh when the appellant shot at him and the shot which entered the body of Dial Singh came out and hit Swaran Kaur. The prosecution evidence itself is that Swaran Kaur was trying to dissuade the appellant and his people from quarrelling. Therefore, she must have been in front of him and could not have been behind Dial Singh. Moreover, even according to the prosecution evidence she was at least 25 or 30 feet behind Dial Singh when the shot was fired by the appellant. A third circumstance is that whereas the injuries on the deceased were in the chest the injuries on Swaran Kaur were a little above the knee. These three circumstances improbablise the prosecution story of the shot fired at Dial Singh going through his body and then going further and hitting Swaran Kaur, femur being fractured. The rib of the deceased was also fractured. In this state of the evidence the learned judges of the High Court thought it necessary to examine a ballistic expert. They have relied heavily on his evidence in order to sustain the conviction of the appellant. We have carefully gone through his evidence and are of the opinion that it does not help to establish the prosecution case, at least not beyond reasonable doubt.

According to the expert the parcel, Ex. P-1, contained two shots and the parcel P-2 contained one shot. The shots in parcel P-1 weighed 4.41 gms. and 4.24 gms. The correct weight of L.G. and S.G. shots is 4.54 gms and 3.54 gms. respectively. Therefore, the two shots in parcel Ex. P-1 were discharged from a cartridge of L.G. size. This part of the evidence may be accepted as correct even though there is some difference between 4.54 gms., 4.41 gms. and 4.25 gms. The shot contained in parcel EX. P-2 was found to weigh 2.76 gms. It could, therefore, be either an L.G or S.G. shot. The expert, however, says that the general shape of the undamaged portion indicated that the shot was possibly an L.G. shot. He was not categorical about it. He was sure that it was a factory made one. There are 6 and 9 shots in L.G. and an S.G. cartridge of standard size respectively.

Now in this case there were five injuries on the deceased all caused by shots. There were three injuries on Swaran Kaur. Even assuming that all these three injuries were caused by three injuries of the shots which entered Dial Singh's body, a position which we find it difficult to accept as natural in view of the force with which they have entered Swaran Kaur's body, there were two more shots, one found in the wall of Sardul Singh's house and another found in front of Malagar Singh's house. There are thus seven shots the presence of which has to be explained. The learned Judges of the High Court thought that the shot found in front of Malagar Singh's

106. *Mohan Singh v State of Punjab*, AIR 1975 SC 2161 : (1975) 4 SCC 254 : 1975 Cr LJ 1865 (SC).

house could have dropped from the person of Dial Singh when he was moving in the house of Malagar Singh or dropped from his apparel in which it had got caught after piercing through a wound. This is a proposition which appears to us to be far-fetched. There is no evidence to support such a proposition. The expert was not asked about it, nor was the doctor who conducted the post-mortem. It appears to us that the shots which could pierce through a body and hit another person at a distance of 30 feet and cause grievous injuries to that person cannot drop from the body of the first person or get caught in his apparel after piercing through his wounds. It also appeals to us that the shots which passed through the body of Dial Singh could not have travelled another 30 feet and hit Swaran Kaur with such force as to fracture her femur. Furthermore, the location of the injuries on the body of Swaran Kaur compared to the location of the injuries on the body of the deceased person cannot be explained as easily as was thought possible by the learned judges of the High Court. The expert stated that the shots after entering the body of Dial Singh, had deflected downwards and this was particularly true in the case of injury number one; secondly, that Dial Singh must have instinctively ducked while receiving the shots at the instants when the shots came out of his body. It is not possible to accept that all the three shots which entered Swaran Kaur could have deflected downwards. If Dial Singh had also ducked then the shot which was deflected could have gone still lower and could not have hit her at all. The evidence of Joginder Kaur that immediately after the gunfire the deceased was seen in a bending position and staggering with his hand placed on his wound cannot support this conclusion. A gunshot takes much less than a split-second to enter a body and we are unable to agree that Dial Singh could have ducked and that might have been responsible for the shots which entered his body finding a lower target when they came out of his body.

The expert stated that he came to the conclusion that the injuries on Dial Singh and Swaran Kaur were probably caused by one gunfire only. It must first of all be noted that he is not categorical about it.

The reasons for his conclusion are the dimensions of the injuries. He had not seen the injuries and it would need superhuman ability to come to a conclusion on this subject by merely looking at the description of the injuries or even the photographs given by the doctors. The dimensions of the injuries noted by the doctors cannot be correct to the extent of 1/100th of an inch. Most of the expert's answers are not categorical. He did not have an opportunity of seeing the injuries of the shots himself. He was mostly giving his answers on the basis of observations made by others and measurements noted by them. A small difference in the measurements one way or the other might make all the difference to the final result. We think it would be unsafe to place implicit reliance on the evidence of the expert for the reasons we have already given and hold that the shots which hit Swaran Kaur and which resulted in the death of Dial Singh were fired from the same gun in a single shot.

CHAPTER 9

FORENSIC ACCOUNTANCY & FINANCIAL FRAUDS

SYNOPSIS

9.1 General 581
9.2 Nature 582
9.2.1 Purpose 582
9.2.2 Accountancy Crimes 584
9.2.3 Forensic Accountancy Classification 584

9.7.1 Basic principles 592
9.7.2 Investigation Drill 593
9.7.3 Action 594
9.7.4 Police cases 595
9.8 Forensic Accountant 595

9.1 GENERAL

Forensic accountancy, also called Forensic Accounting or Financial Forensics, is comparatively a recent avatar on the horizon of Forensics. It is a verification process of accounts of an organisation, department or of an individual to find out if there are any criminal lacunae, irregularities or illegalities (like fraud, embezzlement, forgery and deceit) in the accounts which need legal action against the perpetrator.

Forensic accountant is a Forensic Accountancy specialist. He is specially educated, trained[1] and experienced person in accountancy. He has acquired the expertise to appraise the given account data correctly to locate the depredations of the con artist if any. Ordinarily, he is a Chartered Accountant (CA) academically, a diploma or certificate holder in Forensic Accountancy and has acquired experience through in-service training. Further, he achieves proficiency in general or special fields of accountancy and skill in costing and valuation of materials including equipment, machinery and other paraphernalia used in business by the firm under investigation.

Auditing or Forensic auditing also involves verification of accounts. However, the purposes of the two streams are largely different. Forensic accountancy locates fraudulent lacunae, collects evidence thereof, and appraises the data generated to conclude whether a criminal

1. The Institute of Chartered Accountants of India, keeping in view the importance and need of the forensic accountant, has started a certificate Course in Forensic Accounting and Fraud Detection. E-mail Address: **amitgupta@icai.in and < fafp@icai.in>**

act has been committed or not. He prepares a report on the findings of the investigations. He gives evidence in criminal (or departmental) proceedings to present convincing proof of his findings.

Forensic Auditor (auditing), on the other hand, verifies whether the accounts have been maintained as per departmental instructions and legal requirements or not. He presents his audit report to department/requisitioning authorities. He does not investigate accounting crime. However, if he detects something fishy, abnormal or illegal in the accounts during his audit, he reports the same to the concerned authorities. This report can be used as evidence as per its definition[2]. They appoint a Forensic Accountant to investigate the possible crime. In short, the Forensic Auditor examines accounts to appraise whether the procedures/rules/regulations/instructions and law have been followed/obeyed or not.

Forensic Accountancy and Forensic Audit are, as seen above, distinct disciplines. However, most of the non-professionals take them as synonymous due to facts that both are involved in accounts. In many cases, when a fraud is revealed in auditing, the auditor has also to join in court proceedings.

9.2 NATURE

Forensic Accountancy also known is the art and science of investigation of Forensic financial crimes/frauds through careful evaluation of involved accounts, documents, account books, invoices, orders and receipt. In some cases, valuations of materials (stocks, pledged/hypothecated goods, building, machinery, construction and other work) also form part of Forensic Accountancy.

9.2.1 Purpose

The Forensic Accountancy frauds are committed in varied work situations. However, all of them have same/similar aims, to make money safely. Forensic accountant has the task to tackle his depredations. In practical terms, he has to:

1. Establish *corpus delicti*.
2. Establish the *modus operandi*.
3. Identify the fraudster/forger/con artist.
4. Identify his "business' partners" associate fraudsters.
5. Find evidence/proof to link the criminal/de-link the innocent suspect, with the crime.
6. Find out the disposal mode of the loot of the fraudster or possible site(s)/the mode where the loot has been secreted.
7. Ascertain the losses and to help recover the looted assets.
8. Suggest preventive measure to stem recurrence of similar frauds.

Forensic Accountancy is multidisciplinary. It needs business experience/acumen, investigative skill, accounting/auditing knowledge and familiarity with departmental rules/regulations/

2. A **forensic audit** is an examination and evaluation of a firm's or individual's financial record for use as evidence in court. A **forensic audit** can be conducted in order to prosecute a party for fraud, embezzlement or other financial problems.

instructions. In addition, he has to know scientific criminal investigation. The practitioner has to have a smattering of relevant law so that he remains within the boundaries of the law.

The forensic accountant may need help from other professionals in his investigative work to expose the secreted, mutilated or destroyed evidence. He has to have liaison with such professionals.

Alarm Bells for Accountancy Frauds

1. No departmental rules to fix accountability
2. No working manual or written rules/regulations for staff
3. Incomplete/ill-kept account books
4. Unbalanced accounts
5. No regular/proper/periodic audit/inventory
6. No proper filing system
7. Excessive fund transfers
8. Substantial fund tranfer to kith and kin
9. Improperly kept record of purchase/warehousing/goods movement/sales/transfers
10. Unsecured loans
11. Increasing losses
12. Poor bookkeeping
13. Unusual/inconsistent/abnormal transactions
14. Deficient policies and procedures for staff hiring
15. Employees' lifestyles inconsistent with salaries
16. Presence of chair-stickers taking no vacations
17. Unexplained resignations of upper management
18. Excessive debt/equity ratio
19. Special Purpose Entities (SPEs) to hide debt/loan etc.
20. Not employing qualified/Certified Public Accountant (CPAs)
21. Missig documents/record
22. Unrecorded transactions
23. Negative cash flow
24. Continued losses
25. Sudden unexplained resignation by staff member(s)
26. Reputation for corruption, shady deals
27. Offshore bank accounts
28. Customers/vendors Complaints
29. Incomplete invoices/supporting documents

30. Overriding of internal controls
31. Incomplete/mischaracterization of invoices
32. Unrecorded "off the books" payments
33. Payment to different suppliers with the same address

Forensic Accountancy frauds occur in all types of organisations, big or small. Their *modus operandi,* in general, is similar. Their investigative tools and techniques are similar. However, financial depredations are varied/vast/multi-directional/expanding. They include all sorts of frauds, embezzlements, misappropriations, false bankruptcies, all sorts of forgeries, false claims, impersonations, identity theft, hacking and the like. The losses due to these frauds are skyrocketing. Nevertheless, there are fraud alarms bells (box below), to which the management, administrators, corporations must pay heed.

9.2.2 Accountancy Crimes

Forensic Accountancy deals with crimes of varied nature, including the following:

1. Accounting/auditing, frauds: Wrong/manipulated entries.
2. Wrong loss estimates.
3. Procedures/rules/laws/instructions not followed to commit/promote fraud.
4. Phantom sales/purchase/write-offs/transfer/gifting carried out with ulterior motives.
5. Inflation/deflation of bills or goods (sale/purchase/stock), transport and labour are done to cheat the owners.
6. Valuations of transactions/stocked goods are manipulated to cause losses to one of the parties.
7. False inventories, to hoodwink the concerned
8. Cost accounting: submission of raised expenses and deflated returns.
9. Kith and kin syndrome: funds/assets/goods are transferred to relatives.
10. Benami transactions: investments in the name of bogus non-existing firms/ individuals/trusts to hoodwink the authorities, the concerned persons and the public at large.
11. Computers/Internet Digital Accountancy Frauds.[3]
12. Arson/Accident frauds, perpetrated to destroy financial/stock records.

The list goes on.

9.2.3 Forensic Accountancy Classification

Forensic Accountancy work is classified in the following categories for the convenience of study/discussion:

- Forensic Investigative accountancy,
- Forensic Legal (Litigation) Accountancy, and
- Digital Forensic Accountancy
- Forensic Accountancy in courts

3. Discussed in a separate section ()

9.3 INVESTIGATIVE ACCOUNTANCY

Forensic Investigative Accountancy work requires investigative skills, knowledge of accountancy/auditing, familiarity with the business processes, rules and regulations and abilities to present the findings effectively before the concerned authorities. Forensic accountancy investigator performs two main functions:

1. Establish *corpus delicti* after careful evaluation of the account data, that a financial crime has occurred and *prima facie* there is sufficient evidence for further detailed investigations.
2. Indicate/identify the perpetrator/his partners/helpers/victims/witnesses.
3. Assess the need for services of specialists for the investigations. This is essential as forensic accountancy cases are often complex financial dealings. They need multiple disciplinary skills, experience and modern tools and techniques (like computers) including the assistance of qualified/experienced specialists/experts, like:
   - Document experts
   - Forensic experts
   - Engineers
   - Computer/computer crime expert
   - Software engineers
   - The scientists/technicians of the firms, which installed/started/maintain the operation of the equipment being used
4. Determine the money/assets involved in the fraudulent transaction and the losses thereof,
5. Help to locate the whereabouts of the papers/assets/money defrauded.
6. Help to protect the recovered assets/documents/data/evidential data to get the whole picture of the incidence and provide convincing evidence in the courts.
7. Ascertain the nature of the crime, its *modus operandi,* its ramifications (telgi stamp scam!)
8. Determine its overall impact on the individuals(s), organisations or on the society at large.
9. Collect foolproof evidence about the crime for presentation in the court proof in, identification of and estimating.

Every forensic accountancy case is unique. However, in most of the cases basic investigative steps are the same. The investigative drill of a forensic accountant is:

1. He contacts the client(s) to get facts. They include all elements of the case; possible suspect(s,) estimated losses, how detected, the name of the informer, possible witnesses, *modus operandi* and the time frame of the occurrence/detection, the present location/status of the involved players/documents/evidentiary clues.
2. He collects the recent audit reports, including those before or after the occurrence of the fraud.
3. He, in the absence of a forensic audit report, he carries out a preliminary investigation to establish/eliminate the existence of *corpus delicti.*
4. He contacts the suspect and gets his version of the case. Sometimes the management had already procured the statement of the suspect(s). The forensic accountant collects copies of the same. However, in addition, he interviews/interrogates the suspect to extract the unstated information.

The above preliminary explorations enable a forensic accountant to get a fair idea of the various elements of Financial Forensics fraud in hand. Based on this knowledge, he evolves a working plan for a detailed investigation. The aims of the plan are to:

1. Assess the ramifications of the fraud and to determine the transactions/entities/inventories involved.
2. Identify the workload. Divide it into segments (parts). He locates/collects/copies/studies/examines/analyses all the documents involved or suspected to be involved in the given case, officially. He observes all the needed legal formalities.
3. Fix a tentative time frame for the various workload segments.
4. Identify the culprits covertly (or overtly).Record the number and identity of the participating fraudsters, the number and identity of insiders who helped the fraudster.
5. Identify the witnesses for interview/interrogation,
6. Identify (provisionally) the evidential documents/accounts books, likely to shed light on the fraud.
7. Identify the material stocks (goods) to be appraised/assessed/analysed/evaluated.
8. Identify specialist(s) who will are needed to assist the investigation.
9. Identify the fault line responsible for the fraud.
10. Identify measures to prevent recurrence of similar/other fraud by the same or other fraudsters.

After planning, the forensic accountant starts investigations. The nature of the work varies from case to case but the general outline is similar:

1. He extracts the relevant evidence and uses the same for his report, proof and illustrations.
2. He estimates the losses to the organisation, government and/or individuals involved.
3. He traces the money flight route and its final repository, where the loot has been secreted.
4. He suggests recovery mode of the residual assets.
5. He documents all the features of the fraud he has unearthed.
6. He collects evidence to prove the incriminating findings.
7. He finds proof to link the fraudster with the accountancy fraud, beyond reasonable doubt. Document experts, Forensic experts, Engineers, photographers, material analyst often provide invaluable help,
8. He carries out the valuation of the defrauded assets,
9. He prepares a rough report, after sifting the chaff from the grain, utilizing computerized application such as a spread sheet, database, and imaging.
10. After completing the investigations, he discusses/dissects the strengths and weaknesses of the rough report with his colleagues and hones a viable, intelligible comprehensive convincing report with proper data, proofs, photographs, illustrations and other graphics.
11. He presents a comprehensive report that is precise, concise and intelligible to the addressed audience. The report speaks for itself. It is free of ambiguities, double interpretations and without jargons.

The final report usually is a complete/comprehensive document in itself. It contains the name/details of the referral authorities, the nature of the problem(s) posed, the time frame, data, the documents and other evidentiary clues examined, the details of the findings with illustrations, the persons interrogated, the reports of the specialists involved, cogent reasons for the opinions expressed and the conclusions drawn from the evidence. He attaches copies of all the documents, reports and charts as appendices.

9.4 LITIGATION (LEGAL) FORENSIC ACCOUNTANCY

Investigative accountancy investigations are indispensable in exposing financial frauds. However, such exposures are useful/relevant only if they are acceptable to the courts and they utilise them for the adjudication of the case in hand. The forensic accountant has, therefore, to be a specialist in presenting the highly intricate (in most cases) evidence to the non-professional: the counsels and the judges in the courts. The qualified specialist does his homework with dedication and collects/prepares/presents the necessary data/photographs/charts/graphics, and explains them to the court. The presentation usually provides convincing proof.

Forensic Accountancy is helpful to the court in many ways, including the following:

1. It clarifies intricate/complex questioned financial issues to the judges/counsels/involved parties.
2. It appraises the forensic accountancy evidence of the expert of the opposing party; to find its strengths and weaknesses.
3. It assists the counsel in the cross-examination of the opposing expert, usually by providing a questionnaire[4].
4. It provides briefs, on issues involved in the case, to the counsel for arguments.
5. It finds rebuttal evidence to the presented evidence.

Investigative and legal forensic accountancies do not work in isolation. In fact, they are partners to achieve a common goal and travel the path hand in hand. In some cases, however, the buck stops after the investigative findings only. The parties realise the futility of taking the case to the court and settle the case themselves, with or without the assistance of a forensic accountancy specialist.

Forensic Accountancy is not the be-all and the end-all in all financial frauds/disputes. The ideal situation is fraud-free environment and work culture. However, the utopia is far above our heads. The following mantra can promote it:

1. Recruit only an honest person. Modern science can help in this regard[5].
2. Make periodic check for honesty angle of the staff compulsory.
3. Observe strict control over the fraud trilogy (men, materials and situations) through eternal vigilance.
4. Treat employees as partners.
5. Adopt fair business practices.

Forensic Accountancy provides legal forensic support to counsels in many matters including injury claims, family disputes, contract disputes, insolvency litigation, insurance claims, royalty accounting, shareholders disputes and intellectual property claims.

---

4. Some courts allow the second expert to cross-examine the presenting expert directly, after giving him the power of attorney.
5. Brain Printing, Psychological Detection of Deception, and Narco-analysis test.

9.5 DIGITAL FORENSIC ACCOUNTANCY

Digital Forensic Accountancy is a new avatar, which has come up in the wake of the use of electronics in all aspects of the business. The extensive and ever-expanding use of computers, the Internet and other electronic devices in the business transaction has created a fertile field for the con artist. He is reaping a rich harvest from his Digital Forensics frauds. As society is going towards a paperless society, electronic gadgets will do the accounting work increasingly. The computer, including laptops, tablets and smartphones coupled with the Internet are the new workhorses in accounting and auditing. The misuse of these gadgets and processes has given birth to Digital Forensic Accountancy. These very gadgets (and other specialised software) also help to investigate Digital Accountancy frauds.

9.5.1 Nature

The Digital Forensic Accountancy frauds are similar to hard document forensic accountancy frauds. However, instead of a paper trail, the Digital Forensic Accountant has to deal with plethora of digital data, usually protected through:

1. Passwords.
2. Encryptions.
3. Hiding it in innocuous files.
4. Deletions.
5. A prior command to destroy incriminating record at the specified action (e.g., opening the file) or specified time.
6. Encryption of digital data.
7. Transfer of data to other computers or electronic devices.

Digital Forensic Accountant faces a harder task. He has to deal with elusive data (deleted data, secreted data, manipulated data, stolen data, and transferred data to other computers). He, therefore, has to be vigilant, secretive and ready to seek other expert's help, whenever he needs it. He keeps the impending forensic investigations confidential so that the fraudster is caught unaware and he does not get an opportunity to fiddle with the computers and other digital data storage devices and the accountant seizes the device in an un-tampered form. The seized equipment is protected from remote control fiddling with Faraday security devices.

9.5.2 Hurdles

There are some hurdles peculiar to Digital Investigation. They need special attention of the Digital Forensic Accountant:

1. Integrity of the digital document

The Digital Forensic Accountancy work is not done on the original digital document as it can change/mutilate/destroy the original contents in the process. Thus, it loses its integrity. The Digital Forensic Accountant, therefore, always starts his investigations on an authentic copy of the document, usually, self-prepared. He safeguards the integrity of the original digital document zealously.

2. Volatile digital data

The volatile data gets lost if it is not saved. It is saved by taking its images.

3. Tampered data

The accountant/auditor of the organisation may have changed the relevant data for the benefit of the employer corporation. Digital Forensic Accountant must check and locate changes if any.

4. Time Element

The time lost between the detection of the fraud and initiation of the investigation should be minimal. The computers/laptops/tablets/mobile phones and other digital paraphernalia must be seized immediately and protected from interference through remote devices faraday bags/ vaults are used to protect the seized devices/data. Further copies of all the relevant data must be prepared at the earliest.

9.5.3 Investigation

Digital Forensic Accountancy fraud investigations generally involve all usual Forensic Accountancy aspects (accounting, auditing, departmental rules, governmental laws, valuations and investigative skills to collect/analyse/evaluate evidential matter and to present the evidence precisely, concisely, comprehensibly and convincingly). The Digital Accountant has to know them. Besides, he has to be well-informed and well-versed in computer science and other relevant technologies. Usually, he adopts the following modes of investigations:

1. He interviews the whistleblower, the colleagues of the fraudster, the immediate supervisor, the victim, the suspect and the possible witnesses.
2. He examines the involved digital trail to locate evidence. He ascertains the missing links.
3. He investigates the background and the present lifestyle of the suspect.
4. He Interviews all those who have knowledge about the transaction(s).
5. He consults, covertly, the vigilance people who might have a dossier on the suspect.
6. He gets the suspect digital data and other materials analysed from the relevant experts to collect Electronic Evidence.
7. He checks the physical and electronic surveillance, if employed, to record the activities/movement of the suspect.
8. He collects undercover operations' evidence.
9. He dives deep into the financial ocean to find missing links, lacunae and acts of fraudulent omissions/commissions.

9.5.4 The Tasks

Digital Forensic Accountant has to know account, accountancy and knowledge of electronic equipment used in accounts. He has also to know the *modus operandi* of the fraudster and he has to have skills and abilities to understand their manipulations, to perform his Digital Forensic Accountancy tasks effectively. His main tasks are:

1. The first and the most important task is to protect the evidence available in the seized equipment so that it remains whole and in original form. In other words, no part of the evidence is changed/mutilated/destroyed.
2. He has to be computer (and other gadgetry) and internet savvy. He must know web servers, firewalls, attack methodology, security procedures and penetration testing.

3. He has to consult a Forensic Psychologist to understand the working of the mind of the fraudster, the perpetrator of digital Accountancy frauds.
4. He uses reverse engineering to extract evidence from the hard disk, file systems, directories and files.
5. He uses software (available in the market) to extract the data from the above equipment.
6. He takes the help of the decryption expert when needed. In some cases, keywords/phrases help him. Some software programs save forensic accounting investigators thousands of man-hours by compiling data and identifying patterns. In addition, computer programs can track fraud as it happens.
7. Involves concerned Information Technologist, risk management, security, law enforcement agencies to seek their help whenever the same is needed.
8. He detects and investigates unauthorised activity in the equipment if any.
9. He constructs a digital trail of the suspected accountancy frauds to discover the evidence, which pins the crime to the perpetrator.
10. He inter-links (co-relates) the evidence secured from different sources.
11. He sifts/consolidates the evidence that can be used in court to provide clinching evidence to prove the fraud.
12. He estimates the incurred losses with facts and figures.
13. He understands:
    - The organizational set up of the company involved.
    - The procedures/rules/legal protocol for the case being investigated.

Digital Forensic Accountancy requires a multipronged approach. Relevant fraud investigation software is cost and time effective. They must be used. However, equipment is no substitute for efficient digital forensic accountant. He identifies the fraud patterns, follows the trails, and gets the details of the fraud from the whistleblower and a variety of information from other witnesses. All informants reduce the area of search and promote investigations.

9.5.5 Gadgets

The modes of misuse of computers and other electronic gadgets in Digital Forensic Accountancy are vastly varied and highly intricate. It may be extremely difficult, at least in some cases, for the Digital Forensic Accountant to explore and extract the relevant fraud evidence and prepare a court case single-handed, without the help of computer scientist and other experts/specialists/technicians of the manufacturer of the equipment/maintenance staff. The Digital Forensic Accountant should use their services.

The computer specialists use a variety of software to extract the relevant data, without affecting the integrity of the data, from the equipment, including the following:

1) Passware Kit

Passware Kit is software, which permits access to all password-protected, even encrypted data, in a computer without modifying files or settings. It recovers files and websites passwords.

Passware Kit Forensic is suitable for forensic purpose and maintains the authenticity of the evidence.

2) ACL Desktop

Audit Command Language (ACL) is a tool to read and analyse the type of files scattered across numerous database platforms in a computer. The file and data can be accessed almost immediately. Thus, entire data can be seen and potential areas of interest can be highlighted. The software makes it possible to locate errors and potential fraud; as claimed.

ACL software has **"read only"** access. Its use, therefore, does not affect the integrity of the data.

3) Helix

Helix is software, which helps to acquire proper images from the hard drives and partitions on systems. Many companies have come up with similar software.

Helix software provides information on the basic Systems (Operating system, network and a summary of the contents on the drives). It can furnish exact copies of hard drives, floppy disks, or memory, and store them on removable media, or over to a network.

Helix is also used to scan a system to see if there are any suspect graphic images on the system.

The courts of some countries accept the evidence extracted through Helix software.

4) UltraBlock

UltraBlock (a Brand name) is software used in Digital Forensic Accountancy. It is applied to the data disk being accessed. The software blocks any attempt to change/modify/delete the original data. Thus, it safeguards the integrity/authenticity of the data.

The software and its modifications are useful to access data from all types of data storage. The software is **"read only"** types. Thus, integrity/authenticity of original data remains unchanged.

5) Advance Hash Calculator

Data integrity is basic in Digital Forensic Accountancy. The courts do not admit evidence integrity of which is doubtful. Once a judge, while discussing integrity of evidence, remarked[6]:

Reit par tahmir-e-makan koi kaise kare

SHA-2 uses hash value of the data to preserve integrity of the data. The version of the Advance Hash Calculator, has been the favourite with the investigators for some time. It also includes imaging software.

Computers are an excellent device to hide frauds. However, techniques are known to locate, acquire and analyse the data stored in a suspect computer. The retrieved data provides high quality irrefutable evidence in courts. A Digital Forensic Accountant can, with the help of these devices/software extract, analyse, co-relate and manage the digital evidence. He can, thus, help to stem the ever increasing and expanding tide of Digital Accountancy frauds.

6. Means "***How can a man build a house on sand?***"

9.6 FORENSIC ACCOUNTANCY IN COURT

The forensic accountancy evidence after it is located, found and appraised, is presented in the form of a report to the court. A good report in addition to informational data has the following features:

1. It is written in simple common man's language without technical jargon/terms,
2. Theories/formulas which are beyond the comprehension of the involved non-forensic accountants professionals.
3. It is well reasoned and supported by data/illustrations/photographs/precedents/authorities.
4. It is precise, comprehensive, yet concise and convincing.
5. It discusses both supporting and non-supporting evidence to the main thesis of the report. It indicates the (overwhelming) preponderance of the supporting evidence,
6. It covers the divergent evidence also and shows its insignificance.
7. It contains a brief resume of the engaged Forensic Accountant/expert. It includes his academic qualifications, certification (with depth of the certificate course/the name of institution) as Forensic Accountant, his training (nature/extent), the depth of his experience in accountancy. The number/nature of cases examined is fair index of the depth of experience.
8. It contains a certificate that the tools/techniques used are standard. Forensic Accountant fraternity uses them routinely and the courts accept them.
9. A certificate that the data produced in the report conforms to the standards recognised/accepted for such reports and is adequate.

The tough nut is often the cross-examination by the opposing party with/without the assistance of another Forensic Accountant. Here the aim of the cross-examiner is to:

- Discredit the Forensic Accountant.
- Discredit his evidence.
- Elicit additional evidence, favourable to the defence.

For a counsel, usually, the task of cross-examination is tough (not impossible) as the accounts are a hotchpotch fare of genuine and false data. They are so entangled *inter se* that the extrication of truth needs expertise/experience/patience. Seasoned counsels usually prefer to engage defence Forensic Accountant for assisting them in the cross-examination and processing the Forensic Accountancy evidence for his client.

9.7 FORENSIC ACCOUNTANCY PROCESS

9.7.1 Basic principles

Forensic Accountants follow the following principles in processing Forensic Accountancy frauds. They:

1. Dive deep into the organisation's document records (written documents/computer files) to locate lacunae/missing links and other fraud evidence. Computer crime specialists help.
2. Suspect all members of the organisation. It has been found that the senior staff and those near retirement are more likely to commit accountancy frauds.

In a bank holdup, the local police believed that some bank official was involved in the holdup. They insisted upon a polygraph check of all the members of the staff including the bank president to find out the truth. The president was persuaded to be the first to be examined, to set example for the subordinates. The polygraph examination was to start next morning. At 4.30 am, the president "confessed" eloquently to the crime. He shot himself dead! (CH)

3. Find answers to the questions**:** where/when/what/how/why the fraud occurred. Who is the suspect(s)? Who are the victims? The answers to these questions indicate the manipulations/modus operandi of the Forensic Accountancy frauds.
4. Examine minutely the documents or digital data involved to locate alterations (additions, eliminations, erasures, obliterations) and check for forged seals stamps/signatures/format/handwriting. Requisition Expert helps if spurious documents are suspected.
5. Interrogate possible informants/witnesses.
6. Start Forensic investigation immediately after detection**.** In processing financial fraud investigations delay is fatal to the case. The evidence is destroyed/mutilated/stolen/hidden/misplaced. Witnesses forget the case and its details. If money is involved, it is spent/laundered/secreted or given to kith and kin.

9.7.2 Investigation Drill

Investigative drill of Forensic Accountancy frauds (like black money, money laundering, embezzlement, hidden assets,) is an orderly, step by step, investigation, inquiry, testing, analysis, inspection of assets, or examination of documents, trailing of the missing documents and location of looted money and assets to unravel the forensic accountancy crimes. The Forensic Accountant follows the drill:

1. He examines the legality of the transaction. He checks the laws of the land and rules, regulations and instructions of the department. If they have been flouted, the wilful deviation is brought to the notice of the concerned.
2. He ascertains whether the procedures have been followed or not. He records the ignore process/rules.
3. He checks the documents:
   - Are all the involved documents available?
   - Are some documents missing?
   - Are the documents genuine or forged?
   - Are the documents original/tampered/altered/replaced?
   - Are the receipts genuine? He checks each individual receipt.
   - Do the receipts account for the total sale? Overstatements/understatements of income are common fraudulent practices. The check reveals them to indicate fraud.
4. He compares the financial statements and the receipts/bills/vouchers/account books, to ascertain if the statements are based upon correct data.
5. He follows the trail of important transactions from start to end. It is to verify if the transactions are real and orderly.

6. He ascertains the ramifications:
   - existence of more similar fraud cases
   - Involvement of other branches
   - Possible involvement of other associate corporates
   - Repetitive? Likely to reoccur?

9.7.3 Action

1. Seizure of devices/electronic Media

Once the Forensic Accountant has detected an accountancy fraud, his immediate action is to seize the document and the electronic gadgets containing the incriminating data and keep it in safe custody beyond the reach of the culprit, his associates or well-wishers so that they cannot tamper with the records. In the case of electronic devices, say a computer, he ensures that the data in the device is not deleted, changed or hid by remote control. Faraday purses (for mobile phones) boxes and chambers are used to protect the devices from remote control interference.

The Forensic Accountant may not have the authority to seize the evidence. He approaches the authorities/police to do so.

2. Investigations
